Location.—In the 47 cases where a primary site could be determined, the right lung was involved on 25 occasions and the left lung in 22 instances. The right main bronchus was affected nine times and the left main bronchus in seven instances. The individual lobes were involved in the following manner: right upper lobe, ten times, right lower lobe, six times, left upper lobe, 13 times, left lower lobe, two times.

The slightly greater frequency on the right and the much greater frequency in the upper lobes accords with most of the reports in the literature. There are, however, some reports of a greater frequency in the left lung.[7, 10, 24, 42–44] The presence of only eight cases in the lower lobes is in accord with most reports in the literature, the notable exception being Kikuth who found an almost even distribution in all lobes.[45]

Pathologic Anatomy

Classifications based on the gross appearance of carcinoma of the bronchus have been extremely varied. Various authors have grouped the tumors in from two to five types. It has been our impression that carcinoma of the bronchus could be divided into three main groups: (1) the hilar type arising from the right or left main bronchus, (2) the pulmonary type arising in a branch of the bronchus within the lung parenchyma, and (3) the peripheral type in which no bronchial origin could be found on gross examination. We believe that this classification is justified in that all but four of our cases could be placed in the three groups and the anatomic findings of the individual cases were similar in each of the groups.

In the first two groups, inflammatory changes in the lung parenchyma beyond the obstruction dominate the clinical picture early in the course of the disease.

Hilar Type.—There were 16 cases in this group. This is far less than the 90 per cent reported by Weller and 76 by Jaffe and Rogers.[26, 35, 46] The reason for the discrepancy lies in the fact that these authors included cases of carcinoma arising in the first division of the main bronchus and spread toward the mediastinum. The point of origin within the main bronchus is usually 2 or 3 cm. below the bifurcation of the trachea. The mucous membrane in this region is irregularly thickened, and the lining surface has a rough, granular, yellow surface. At this stage of development the diagnosis is made only by microscopic study. As the process continues, the growth extends in all directions. In its extension through the bronchial wall there is a complete disruption of the normal architecture of the bronchus. Having reached the outer wall of the bronchus, the tumor then extends into the adjoining mediastinal structures. First the superior and inferior tracheobronchial nodes are encircled by the tumor and gradually replaced by it. The tumor then extends to the neighboring structures to involve the medial pleura of the affected side. The recurrent laryngeal and phrenic nerves lying on the lateral aspect of the trachea may also become embedded in the tumor mass. In its anterior extension the carcinoma encircles the walls of the pulmonary artery and vein, the superior vena cava and the arch of the aorta, the parietal pericardium, and less frequently the myocardium. The tumor grows outward in a radiating, fan-shaped mass, is usually of firm consistency, and has a yellow color. A coronal section shows remnants of lymph nodes and the blood vessels compressed within the tumor mass. In its posterior progression, which is a less frequent occurrence, the carcinoma may extend into the wall of the esophagus (6 per cent). Perforation into the lumen of the esophagus has been observed twice by Kramer and Som.[47] In both instances it was a squamous cell carcinoma of the right main bronchus.

TABLE 1.—AGE INCIDENCE IN 50 AUTOPSIES ON CARCINOMA OF THE LUNG

Age (Years)	Number of Cases
20–29	2
30–39	2
40–49	5
50–59	20
60–69	19
70–79	2

The lumen of the bronchus becomes progressively narrower, occasionally because of a fungating mass growing into the canal, but most often because of the marked thickening of the bronchial wall in the region of the tumor Boyd was impressed with the frequency with which it grows outward rather than inward, and Halpert pointed out that narrowing and obliteration of the lumen is more frequently caused by infiltration than by intralumenal growth [29 48] The tumor extends in the direction of the trachea and also toward the branch bronchi In a few instances we found tumor growing into the lumen as a fungating yellow mass As the mass grows larger, it undergoes necrosis and liquefaction so that parts of the tumor are expectorated and the lumen regains some of its patency again.

The retention of bacteria distal to the narrowed portion of the bronchus results in bronchopneumonia, purulent bronchitis, lung abscesses, bronchiectasis, and pulmonary fibrosis Occasionally, the lung abscess may rupture into the pleural space and result in an empyema Secondary infections of the lung and their sequelae dominate the process and so obscure the primary lesion that the diagnosis of lung abscess or empyema is made long before the discovery of the malignancy Graham rightly states that it is these complications and sequelae which are responsible for many deaths [49] Pleural aspirations in these cases will often reveal no evidence of tumor cells

Pulmonary Type —The gross findings in different cases of this group vary but slightly, and such differences as occur depend on the order of bronchus in which the carcinoma arises

The early anatomic changes are similar to those in the hilar type In its growth outward, the tumor encloses the regional peribronchial lymph nodes and extends into the surrounding lung parenchyma Thus forms a large yellow area, and in cases arising in first order bronchi the mass extends to the pleura, usually in the medial aspect of the lung and from there to the mediastinal structures The mediastinal invasion is never as extensive as in the hilar type However, some authors have included these cases in their hilar group

As the tumor enlarges, areas of necrosis and liquefaction develop within it When these are evacuated, the resultant cavity is usually lined by a wide yellow zone of tumor tissue Sometimes a portion of the cavity is lined by a gray membrane, indicating secondary infection In a number of cases a branch of the pulmonary artery may be invaded by the tumor This process resulted in fatal hemorrhages in six cases of this series

Concomitant with the obstructive changes in the lumen of the bronchus are the inflammatory changes which develop in the portions of the lung parenchyma peripheral to the occlusion. These changes are usually limited to the segment supplied by the involved bronchus With the extension of the tumor into adjoining proximal branches other segments will show these secondary changes Occasionally, the tumor of a first order bronchus may extend to the bronchus of the adjoining lobes, and with obstruction this lobe will also develop an extensive secondary infection

The abscess cavities are easily distinguishable from the tumor cavities The former are lined by a pyogenic membrane and show no tumor tissue within their walls

Peripheral Type —There were seven cases in this group (14 per cent) Jaffe found it in 13 per cent of his cases [35] This is of interest since Klotz emphasized that this type of tumor is exceedingly rare, and he had only observed one such case We agree with Jaffe that this type of tumor offers the greatest diagnostic difficulties [36] Although this type of tumor appears in most classifications, its criteria are not sharply defined, and to different authors the phrase has different meanings

This tumor is present in the peripheral portions of the lung and is of variable size (2 to 5 cm) Occasionally the tumor lies completely within the lung parenchyma and is discovered incidentally at autopsy (one case) In others it extends to involve the overlying pleura (two cases), and sometimes it may extend to the adjoining chest wall In our series, of three cases which remained localized, one was a squamous carcinoma, one an adenocarcinoma, and the third an undifferentiated cell carcinoma In one case a peripheral carcinoma located in the superior and medial aspect of the lobe extended into the mediastinum to involve the pericardium and the myocardium of the heart Three of the seven cases showed distant metastases

It is rather interesting that in two separate reports in the same publication Rabin and Neuhof conclude that circumscribed tumors unrelated to bronchi are the most favorable for operation, while Tuttle and Womack, from observations of autopsy material, found that most patients whose first symptoms were from metastatic lesions had a primary lesion, often very small, in the periphery of the lung [50 51] Perhaps both these reports may be reconciled by the fact that some of the peripheral carcinomas invade the blood stream early in the disease, while others do not show that tendency

Histogenesis

For a long period of time it was felt that carcinoma of the lung may arise from either the mucous membrane of the bronchus, the mucous

glands, or the alveolar epithelium Klotz correctly pointed out the futility of histogenetic grouping because of the fact that there is usually little resemblance between tumor cells and normal pulmonary structures, making it difficult to establish histologic origins The greatest difficulty lies in the fact that many of the tumors show varied histologic pictures The generally accepted view today is that carcinoma of the bronchus arises exclusively from the bronchial epithelium. There are many authors who believe that this is the only type of carcinoma in the lung

An increasing number of reports in the literature support the view that alveolar epithelium exists and that carcinoma may arise from it Tuttle and Womack point out that mucous glands apparently have their origin from bronchial epithelium.[51] The ducts are lined by ciliated cells continuous with those of the lumen of the bronchus, and the mucous glands are composed of cells similar to goblet cells This genesis simplifies the classification of bronchogenic carcinoma, and they conclude that since all the structures have the same origin, it is unnecessary to classify mucous glands separately There is, however, no universal agreement on this subject Frissell and Knox believe that both pulmonary and metastatic carcinomas may replace the normal lining epithelium by a single layer of tall, columnar cells, and this represents only an adaptation of the tumor to the anatomic structure of the lung [52]

Histopathology

We have found that all the cases could be classified into one of three types squamous cell, undifferentiated cell carcinoma, and adenocarcinoma The first two types form the great majority of cases in our series, and this is in agreement with most reports in the literature Although we found the undifferentiated type most common, many other authors found the squamous cell form to be most frequent [18,41,44,48,53]

We have not been able to verify Geschickter and Denison's observations that the squamous cell carcinoma arises in the hilar region and is more common after the age of fifty years and that below the age of fifty the undifferentiated cell type predominates [54] Our findings agree with Frissell and Knox and Samson that morphology has nothing to do with the level of origin and that none of the three types is found exclusively in any one location.[52,55]

Boyd correctly stated that there is perhaps no tumor which is so pleomorphic as carcinoma of the lung and that it varies from the most undifferentiated to the most fully differentiated.[29] The great difficulty with any attempt at histologic classification of pulmonary carcinoma is the marked variation of cell morphology in the same tumor It is not an infrequent occurrence to find two or three distinct cell types in the same microscopic section We are inclined to agree with Willis that, if enough sections were studied in each case, all three types would be observed in every carcinoma of the bronchus [56] Brines and Kenning believe that the variations of cell types in the same tumor are unquestionably due to multiple stages of differentiation and constitute the highest type of proof that the various microscopic patterns in primary carcinoma of the lung are entirely the result of differentiation from a common ancestral type [5]

Weller, basing his classification on differentiation alone, represented the course of differentiation of a common parent cell by the letter Y [57] This undifferentiated cell in his schema occupies the lower extremity of the stem, and slightly or poorly differentiated neoplasms are represented by the stem of the Y The crotch of the Y represents the point at which there is some evidence of differentiation into columnar epithelium The extreme upper portion of the left arm represents entdifferentiation into papillary and mucin-secreting types Along the right arm of the Y there are various stages of differentiation into squamous cells progressing from entdifferentiation to the cornifying epithelioma at the top of the arm Samson in a subsequent study from the same laboratory found that his cases fitted into this schema without any difficulty [55] Most investigators, on the basis of morphologic studies following inflammation and animal experiments, believe that carcinoma of the bronchus arises from the basal layer of the bronchial epithelium These line the tunica propria and appear to be the only epithelial cells in the mucous membrane of the bronchial tree which are concerned with cell division and cell differentiation. Fried believes that the process of repair or regeneration is performed by the basal cell only [30] In physiologic repair these cells differentiate merely into the normal lining of the bronchus, but when the process is a pathologic one, their fate depends on the nature of the stimulus and the resistance of host They may form metaplastic islands and so remain indefinitely or may develop a malignant tumor Halpert states that, if the epithelial cells which replace other epithelial cells in a given area retain their embryonic potentialities, it is easy to see how, in the course of forced and frequent cell division, dominant characteristics may be supplanted by recessive ones, and thus stratified squamous epithelium may be produced by these cells [43] They believe that such a concept offers a logical explanation for the variety of the cellular

structure of carcinoma of the lung Willis taking sharp issue with this point of view states that it is a self-evident statement that the tumors arise from cells capable of multiplication, and the so-called "reserve cell carcinomas" are merely anaplastic [56]

Metastases

Widespread metastases as a result of lymphatic and blood stream invasion are frequently encountered in pulmonary carcinoma In some instances small tumors may result in widespread blood stream metastases In one of our cases with extensive extrathoracic metastases the primary bronchial carcinoma was found with some difficulty

The regional lymph nodes were involved in varying degrees in all but three of our cases These were the three cases of peripheral carcinoma of the lung Two of these extended to involve the overlying pleura and one was confined to the lung parenchyma This latter case was the only one in our series which showed no evidence of metastasis

TABLE 2 —METASTASES IN A SERIES OF 50 AUTOPSIES

	Number	Per Cent
Regional Nodes	46	92
Pleura (extension)	39	78
Pericardium	14	28
Adrenals	13	26
Kidneys	12	24
Bone	11	22
Liver	9	18
Abdominal Lymph Nodes	11	22
Spleen	5	10
Myocardium	4	8
Pancreas	3	6
Esophagus	3	6
Diaphragm	3	6
Brain	2	4
Thyroid gland	1	2
Parotid gland	1	2

This neoplasm, although it metastasizes to many organs, shows a predisposition to seed in the adrenals and brain From Table 2 it may be seen that adrenal metastases were found in 26 per cent of the cases and brain metastases in 4 per cent The low incidence of brain metastases in our series may, in part, be explained by the fact that brains were not examined in more than half of our cases Dosquet in a comparison with other malignancies finds that frequency of metastases to these organs by carcinoma of the lung is a distinguishing feature of this tumor [58] Fried and Buckley explain the greater frequency of brain metastases from lung cancer when compared with extrapulmonary carcinoma on the lack of any barrier between the lung and the brain [59] Visceral cancers, on the other hand, reach the lungs with great frequency where they are retained by the pulmonary capillaries

Some authors have stated that the more anaplastic tumors show a great tendency to widespread metastases while the squamous cell carcinoma tends to remain limited to the regional lymph nodes [6,14,55] Boyd found no connection between the degree of cellular differentiation and the tendency to metastases [29] Our own findings would indicate that some of the most anaplastic tumors may remain confined to the regional lymph nodes, while some of the most fully differentiated may become widely disseminated In 57 per cent of the undifferentiated cell carcinomas and in only 17 per cent of the squamous cell carcinomas, there were extrathoracic metastases Karsner and Saphir found an almost similar distribution in their series [41]

The presence of distant metastases in 75 per cent of the cases of adenocarcinoma would tend to verify the statement of Frissell and Knox that this is the most rapidly growing and widely metastasizing of lung tumors [52] It is interesting to note that Olsen found this group as showing the least tendency to metastasize [44] In contrast, Koletsky found extrathoracic metastases in 35 per cent of the squamous cell carcinoma, as compared to 89 per cent of the small cell carcinoma and 86 per cent of the adenocarcinoma [6]

Other Forms

There were four cases in this series which could not be classified in the three groups outlined above.

Carcinoma Pneumonia.—Two of the cases were those of carcinoma pneumonia, both cases in women The much greater incidence of women with carcinoma pneumonia than carcinoma of the bronchus has been stressed by Neuberger and Geever and Ikeda [60,61] One of the women was twenty-five years and the other forty-five years of age Both cases assumed the diffuse form first described by Musser [62] Clinically and roentgenologically both cases behaved like confluent bronchopneumonia involving both lungs On gross examination the lungs in each case showed a gray, granular surface in which the lobular configuration was still discernible A diagnosis of carcinoma could not be made on gross examination, and the first case was mistaken for pneumonia in the stage of gray hepatization

The microscopic appearance of the lungs in these two cases was as follows the alveolar septa were thickened by connective tissue but intact In one of the cases the septal walls were lined by columnar epithelium, some of which showed papillary protrusions In many areas the epithelium lay free in the lumen and showed a definite acinar formation In the other case the epithelial cells were arranged in sheets The cells were large and contained plump nuclei within which were large prominent nucleoli Mitotic figures and small focal areas of necrosis

were found in both cases The lymphatic vessels were distended and filled with tumor cells In both cases the bronchi and bronchioles were extensively studied but showed no evidence of carcinoma, and we feel reasonably certain that they did not give origin to the tumor These cases were reviewed by Ewing who concurred in the opinion that both cases were alveolar cell carcinoma

There are many authors who doubt the existence of this type of carcinoma because they doubt the existence of an epithelial lining [30 40 54,61] Some believe that it is really a bronchogenic carcinoma which rapidly metastasizes to different parts of the lung by way of an epithelial downgrowth from the bronchial tree with extension through pores of Kohn and the lymphatic channels [5,61] Neuberger and Geever collected 25 authentic cases of alveolar cell tumors up to 1942 [60] They believe that the idea of tumor arising in multiple bronchiolar foci seems preferable to them because of failure to show a primary bronchial focus and because no tumor downgrowth or extension through pores of Kohn was observed by them in their cases

Herbut on the other hand believes that such a supposition is entirely unnecessary [65] Since bronchogenic carcinomas ordinarily are considered to arise from one bronchus and the multiple growths throughout the rest of the lungs are considered metastatic, why should the same explanation suffice for carcinomas with an alveolar distribution He points out that it is a simple matter for the cells to break through the thin lymphatic walls or to move peripherally along the lumina of the bronchioles until the air sacs are reached

Multicentric Origin.—One case was of multicentric origin in a case of pulmonary silicosis Both lungs were studded with yellow nodules which varied in size from 1 to 5 mm These were distinct from the silicotic foci It is interesting to note that Rosedale and McKay described two cases of a diffuse type occurring in the presence of pneumoconiosis [33]

Microscopic study of these foci revealed an undifferentiated cell carcinoma arising in different branches of the bronchi in all lobes of the lung In most instances the carcinoma was limited to the bronchi or bronchioles and the surrounding lymphatic vessels In other areas the tumor had extended into the surrounding lung parenchyma There were widespread metastases to the extrathoracic viscera in this case

We feel justified in concluding that it was of multicentric origin in this case since many of the bronchi and bronchioles showed the malignant changes limited to the superficial layers Lindberg and Fevrter observed minute carcinoma foci in many bronchial branches [63,66] Karsner and Saphir believe that the multiplicity of nodules in the same lung is the result of metastasis, and they consider their view to be supported by the well-recognized propensity of lung cancer to invade lymphatic channels and veins early in the disease [41]

Microscopic Carcinoma of a Bronchiole — The fourth case was one of carcinoma in a patient with chronic pulmonary tuberculosis in which the primary site was found in a bronchiole of the upper lobe of the right lung only after careful search The reason for the search was the presence of gross metastases to the pleura and right superior tracheobronchial lymph nodes

The extensive metastases in the presence of a microscopic carcinoma is an extremely interesting finding Gray and Cordonnier reported a case of carcinoma in the lung in which the diagnosis was first made on routine microscopic examination.[67] They were impressed by the early invasion of the lymphatic channels In our case the metastases progressed to a much greater extent than the original growth Similar cases to ours have been reported by Womack and Graham, Stewart and Allison, and Turner and Willis [68–70]

Associated Chronic Pulmonary Tuberculosis

Pulmonary tuberculosis was associated with the carcinoma in 17 5 per cent of the cases On the other hand, when one considers that during this same period of time there were more than two thousand autopsies of chronic pulmonary tuberculosis in which there was no associated pulmonary carcinoma, we may conclude that the incidence of carcinoma in phthisic patients is no greater than that of the general population

Summary and Conclusions

1 Carcinoma of the bronchus is found in about 1 per cent of all autopsies and in about 8 per cent of all deaths from carcinoma

2 A review of the literature makes it appear that much of the increase in bronchial carcinoma is apparent How much is real will probably never be known

3 There were 50 autopsies of carcinoma of the lung in this series, 92 5 per cent were men, 7 5 per cent were women, 85 per cent were in whites and 15 per cent in Negroes The greatest number of cases were in the sixth and seventh decades of life

4 In 47 cases where a site could be determined, the right lung was involved in 25 and the left in 22 instances, the upper lobes were implicated more frequently than the lower

5 On the basis of its gross appearance and sequelae, carcinoma of the bronchus is divided

into three main groups (1) hilar type arising in the main bronchi, (2) pulmonary type, arising in branch bronchi, and (3) peripheral type in which the origin within a bronchus is not found on gross examination

6 The hilar type which comprised 32 per cent of all the cases is characterized by the carcinoma arising within the wall of the main bronchus As the growth progresses in all directions, it results in a thickening of the wall and a narrowing of the lumen In its outward progression it extends to and surrounds the adjoining mediastinal structures

7 The pulmonary type which comprised 46 per cent of all the cases is characterized by the carcinoma arising in a branch bronchus In its growth outward the tumor encloses the regional peribronchial lymph nodes and extends into surrounding lung parenchyma, forming a large yellow mass If necrosis and liquefaction supervene, a cavity may result If the first order bronchus is affected, it may extend to the mediastinum, but this is never as extensive as in the hilar type

(*a*) As a result of the narrowing of the bronchus, the bacteria retained within the lung give rise to bronchopneumonia, purulent bronchitis, lung abscess, bronchiectasis, pulmonary fibrosis and/or empyema if the abscess ruptures into the pleural space

(*b*) These secondary changes dominate and often obscure the picture of the carcinoma of the bronchus In the hilar type the secondary changes are present in the entire lung and the pulmonary type are present only in the region peripheral to the involved bronchus

8 The peripheral type which comprised 14 per cent of the cases lies in the peripheral portion of the lung and may extend to involve the overlying pleura and even the chest wall In three cases there were distant metastases.

9 Microscopically, all cases could be classified into one of three types undifferentiated cell carcinoma, squamous cell carcinoma, and adenocarcinoma Two or three types are often found in the same case and sometimes in the same slide

10 Two of our cases fit the criteria of carcinoma pneumonia One case was of multicentric origin in many of the bronchi and bronchioles of both lungs, and one case was that of a microscopic carcinoma of a bronchiole with gross metastases

11 Metastases were present in all but one case and were the result of lymphatic and blood stream dissemination The cases of adenocarcinoma metastasized outside the chest (75 per cent) more frequently than undifferentiated cell carcinoma (57 per cent), while squamous cell carcinoma only metastasized in 17 per cent of the cases

I should like to express my thanks to Dr Theodore Ehrenreich for allowing me to review the cases at Sea View Hospital which I studied when I was pathologist at that institution.

THE ROLE OF BRONCHOSCOPY IN DIAGNOSIS AND TREATMENT

Louis H Clerf, M D , and Peter Herbut, M D , Philadelphia, Pennsylvania

(From the Departments of Laryngology and Broncho-Esophagology and the Clinical Laboratories of Jefferson Hospital)

APPROXIMATELY a quarter of a century has passed since the first positive diagnosis of bronchogenic carcinoma was made in a living patient by bronchoscopic biopsy Prior to that time the diagnosis commonly was based on a study of metastatic lymph nodes or the findings at autopsy In 1926, Grove and Kramer reported a series of 24 cases of primary carcinoma of the lung [1] In 21, the diagnosis was made at autopsy, and in the remaining three by biopsy of a metastatic lymph node In none had there been a bronchoscopic examination. They stressed the importance of bronchoscopic examination as a useful diagnostic procedure and expressed the opinion that its frequent employment and an appreciation that primary carcinoma of the bronchus is not rare would lead to more correct diagnoses in living patients. They further emphasized that the use of bronchoscopy both in diagnosis and treatment offered hope where, formerly, the prognosis was very poor During the same year McCrae pointed out that since primary carcinoma of the lung commonly had its origin in a bronchus, bronchoscopy with biopsy could give information which was obtainable in no other way [2] He emphasized the importance of bronchoscopy particularly for early diagnosis

Internists slowly began to recognize the value of bronchoscopy as a diagnostic aid, and an increasing number of cases of carcinoma was reported in the literature In reviewing a series of 336 cases observed in the department of broncho-esophagology at the Jefferson Hospital from 1930 to 1945, it is noted that a diagnosis of carcinoma was made by biopsy in approximately 65 per cent [3] Holinger and his group reported 78 per cent positive biopsies in a series of 175 cases examined bronchoscopically [4] Overholt reported positive bronchoscopic biopsies in 62 per cent of his cases, and Adams was able to report a positive bronchoscopic diagnosis in 89 3 per cent of a series of 122 cases [5,6] Ochsner and his associates stated that bronchoscopy should give a positive diagnosis in about 70 per cent of cases of bronchial carcinoma.[7]

It soon was learned that, while bronchoscopy was of value in diagnosis, it offered practically nothing in the field of therapy Bronchoscopic removal, surgical diathermy carried out through the bronchoscope, and the employment of radium element or radon introduced bronchoscopically afforded only slight temporary relief It was not until 1933 that the first successful pneumonectomy for bronchogenic carcinoma was performed by Graham, and this remains the only plan of therapy that has been attended with success A study of cases reported up to 1946 clearly demonstrated that, whereas there were many large series of cases recorded, relatively few had been successfully treated by surgical extirpation and none by irradiation or other methods Furthermore, all the evidence seemed to indicate that the diagnosis of bronchial carcinoma, made at a time when surgical removal could be successfully performed, was accomplished in a minority rather than in a majority of the cases, this in spite of the fact that physicians were becoming cancer-of-the-bronchus conscious and that every effort was made to establish a positive diagnosis antemortem

Presented by invitation, at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Session on Chest Diseases, May 20 1948.

into three main groups (1) hilar type arising in the main bronchi, (2) pulmonary type, arising in branch bronchi, and (3) peripheral type in which the origin within a bronchus is not found on gross examination.

6 The hilar type which comprised 32 per cent of all the cases is characterized by the carcinoma arising within the wall of the main bronchus As the growth progresses in all directions, it results in a thickening of the wall and a narrowing of the lumen In its outward progression it extends to and surrounds the adjoining mediastinal structures

7 The pulmonary type which comprised 46 per cent of all the cases is characterized by the carcinoma arising in a branch bronchus In its growth outward the tumor encloses the regional peribronchial lymph nodes and extends into surrounding lung parenchyma, forming a large yellow mass If necrosis and liquefaction supervene, a cavity may result If the first order bronchus is affected, it may extend to the mediastinum, but this is never as extensive as in the hilar type

(a) As a result of the narrowing of the bronchus, the bacteria retained within the lung give rise to bronchopneumonia, purulent bronchitis, lung abscess, bronchiectasis, pulmonary fibrosis and/or empyema if the abscess ruptures into the pleural space

(b) These secondary changes dominate and often obscure the picture of the carcinoma of the bronchus In the hilar type the secondary changes are present in the entire lung and the pulmonary type are present only in the region peripheral to the involved bronchus

8 The peripheral type which comprised 14 per cent of the cases lies in the peripheral portion of the lung and may extend to involve the overlying pleura and even the chest wall In three cases there were distant metastases

9 Microscopically, all cases could be classified into one of three types undifferentiated cell carcinoma, squamous cell carcinoma, and adenocarcinoma Two or three types are often found in the same case and sometimes in the same slide

10 Two of our cases fit the criteria of carcinoma pneumonia One case was of multicentric origin in many of the bronchi and bronchioles of both lungs, and one case was that of a microscopic carcinoma of a bronchiole with gross metastases

11 Metastases were present in all but one case and were the result of lymphatic and blood stream dissemination. The cases of adenocarcinoma metastasized outside the chest (75 per cent) more frequently than undifferentiated cell carcinoma (57 per cent), while squamous cell carcinoma only metastasized in 17 per cent of the cases

I should like to express my thanks to Dr Theodore Ehrenreich for allowing me to review the cases at Sea View Hospital which I studied when I was pathologist at that institution.

THE ROLE OF BRONCHOSCOPY IN DIAGNOSIS AND TREATMENT

Louis H Clerf, M D , and Peter Herbut, M D , Philadelphia, Pennsylvania

(From the Departments of Laryngology and Broncho-Esophagology and the Clinical Laboratories of Jefferson Hospital)

APPROXIMATELY a quarter of a century has passed since the first positive diagnosis of bronchogenic carcinoma was made in a living patient by bronchoscopic biopsy Prior to that time the diagnosis commonly was based on a study of metastatic lymph nodes or the findings at autopsy In 1926, Grove and Kramer reported a series of 24 cases of primary carcinoma of the lung [1] In 21, the diagnosis was made at autopsy, and in the remaining three by biopsy of a metastatic lymph node In none had there been a bronchoscopic examination. They stressed the importance of bronchoscopic examination as a useful diagnostic procedure and expressed the opinion that its frequent employment and an appreciation that primary carcinoma of the bronchus is not rare would lead to more correct diagnoses in living patients They further emphasized that the use of bronchoscopy both in diagnosis and treatment offered hope where, formerly, the prognosis was very poor During the same year McCrae pointed out that since primary carcinoma of the lung commonly had its origin in a bronchus, bronchoscopy with biopsy could give information which was obtainable in no other way [2] He emphasized the importance of bronchoscopy particularly for early diagnosis

Internists slowly began to recognize the value of bronchoscopy as a diagnostic aid, and an increasing number of cases of carcinoma was reported in the literature In reviewing a series of 336 cases observed in the department of broncho-esophagology at the Jefferson Hospital from 1930 to 1945, it is noted that a diagnosis of carcinoma was made by biopsy in approximately 65 per cent [3] Holinger and his group reported 78 per cent positive biopsies in a series of 175 cases examined bronchoscopically [4] Overholt reported positive bronchoscopic biopsies in 62 per cent of his cases, and Adams was able to report a positive bronchoscopic diagnosis in 89 3 per cent of a series of 122 cases [5,6] Ochsner and his associates stated that bronchoscopy should give a positive diagnosis in about 70 per cent of cases of bronchial carcinoma [7]

It soon was learned that, while bronchoscopy was of value in diagnosis, it offered practically nothing in the field of therapy Bronchoscopic removal, surgical diathermy carried out through the bronchoscope, and the employment of radium element or radon introduced bronchoscopically afforded only slight temporary relief It was not until 1933 that the first successful pneumonectomy for bronchogenic carcinoma was performed by Graham, and this remains the only plan of therapy that has been attended with success. A study of cases reported up to 1946 clearly demonstrated that, whereas there were many large series of cases recorded, relatively few had been successfully treated by surgical extirpation and none by irradiation or other methods Furthermore, all the evidence seemed to indicate that the diagnosis of bronchial carcinoma, made at a time when surgical removal could be successfully performed, was accomplished in a minority rather than in a majority of the cases, this in spite of the fact that physicians were becoming cancer-of-the-bronchus conscious and that every effort was made to establish a positive diagnosis antemortem

Presented, by invitation, at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Session on Chest Diseases May 20 1948.

There were several explanations of this The principal one was failure of the patient to consult his physician during the incipient stages of the disease This was due in great part to the absence or the insignificance of symptoms in early disease A second common cause for failure in diagnosis was delay in utilizing the available diagnostic methods Overholt emphasized this need in his report of 143 patients with bronchial carcinoma, 60 per cent of whom were treated for many months on the basis of an incorrect diagnosis [5] Many of his patients were diagnosed as having bronchitis, pneumonitis, unresolved pneumonia, or other conditions without their ever having had a thorough examination The early clinical course of carcinoma is misleading because symptoms either are absent or slight, or they may masquerade as some other disease Physicians also had not developed a sufficiently strong suspicion of carcinoma—in other words, they were not cancer-minded

In a further review of our cases at the Jefferson Clinic, particularly on the basis of surgical exploration and successful treatment, it was found that relatively few were operable because of advanced disease It appeared that the higher the percentage of positive bronchoscopic biopsies, the higher the percentage of inoperable cases As a result few surgeons were able to report a series of successfully operated cases higher than 10 or 15 per cent of the total number observed

A critical study of published reports indicated that a majority of primary carcinomas diagnosed by bronchoscopic biopsy were found to have had their origin in or to have intruded into the larger bronchi, peripherally situated lesions and those in the upper lobes usually were not diagnosed positively until they began to intrude into a larger bronchus or produced signs of bronchial stenosis A retrograde telescope was employed for upper lobe lesions, but this was found to be of little assistance Pneumothorax in upper lesions was advocated but it had definite limitations and frequently did little to improve visualization of lesions A study of sputum for neoplastic cells had been advocated, but in this country few positive cases were reported Aspiration biopsy was recommended, but because of the dangers of cancer implantation it was condemned by a majority of the thoracic surgeons Exploratory thoracotomy was recommended, but neither physicians nor patients received this with enthusiasm.

In an effort to increase the number of positive diagnoses in pulmonary lesions which exhibited roentgen appearances of carcinoma but in which bronchoscopy proved negative, we inaugurated a study of specimens of sputum for neoplastic cells employing a paraffin technic, as well as smear examinations This proved unsatisfactory, and few cases were discovered. In fact, neoplastic cells were found infrequently, even in known cases of bronchogenic carcinoma

The excellent results secured by the use of the Papanicolaou technic in diagnosing carcinoma of the cervix suggested to Dr Herbut that the same method might be employed in a study of bronchial secretions where, previously, failure was almost continuously recorded in sputum studies.[6] Bronchoscopically secured secretions were selected instead of sputum, for secretions are scant in early carcinoma, and sputum, therefore, often is not available It becomes profuse only when there is obstruction with retention of secretion and suppuration and, therefore, is observed more often in advanced stages of the disease Sputum is more dilute than bronchial secretions In addition, cells undergo disintegration more readily By bronchoscopy one could secure adequate secretions from the bronchus in the region of the suspected neoplasm, and these can immediately be fixed and stained

The result by this technic exceeded expectations so that in the first series of cases of carcinoma proved by bronchoscopic biopsy, exploratory thoracotomy, biopsy of metastatic lymph nodes, or necropsy, a positive cytologic diagnosis of carcinoma was made in 22 of 30 cases (73 per cent) In this same group the histologic diagnosis of carcinoma based on bronchoscopic biopsy was made only in 11 cases (36 6 per cent)

There were certain technical difficulties in the earlier cases, but these have been overcome In all suspected cases of carcinoma, routine bronchoscopy was carried out for diagnostic purposes in the customary manner Roentgenogram aided in localizing the lesion to a lobar segment, a lobe, or lung The secretions in the trachea and larger bronchi were discarded since these represented marked dilution and disintegration of cells commonly was noted Secretions were secured in a special bronchoscopic collector from the bronchial subdivisions under suspicion and were sent to the laboratory where smears were made and fixed Later it was found that washings with normal saline solution offered a decided advantage Several cubic centimeters of normal saline solution were instilled through a bronchoscopic aspirating tube into the suspected bronchus, and after one or two minutes the material was reaspirated into a collector and immediately sent to the laboratory

In the upper lobe lesions better results could be secured by placing the patient on the involved side so that, if a right upper lobe bronchus was suspected as the site of carcinoma, the patient was placed on the right side after the bronchoscope had been introduced Saline solution was

then instilled into the right upper lobe bronchial orifice and the material reaspirated, employing curved, flexible-tipped aspirating tubes

Attempts were made in patients with scant secretions to secure the material on a small gauze sponge carried into the bronchus through the bronchoscope, and then slides were smeared from this. It was not satisfactory as the material dried too quickly and could not be fixed properly The present routine, therefore, is to use saline solution in sufficient quantity to secure bronchial washings The material is smeared on slides and while still wet is fixed with equal parts of ether and 95 per cent alcohol and then is stained by the Papanicolaou technic

As a result of this method of diagnosis to supplement bronchoscopic biopsy, it has been possible to diagnose cases of carcinoma which are beyond the range of vision of the bronchologist and in which bronchoscopy is absolutely negative These are the cases that offered a direct challenge diagnostically, for with negative bronchoscopic findings the diagnosis could be made only by exploratory thoracotomy *Too often they were* not brought to a final conclusion diagnostically until other plans of diagnosis and therapy were tried and valuable time lost The cytologic method of diagnosis has brought to the surgeon cases of carcinoma that have their origin in the peripherally situated bronchi, and these, more often, are amenable to surgical extirpation than are the lesions which have their primary origin either in a large bronchus or, at one time peripherally situated, have finally invaded the larger bronchi and appear as an apparent primary lesion in a main bronchus

Results of Procedure

To determine the value of any diagnostic aid it is important to report failures as well as successes The high percentage of bronchoscopic biopsies reported in the literature are impressive, but little account is taken of those bronchoscopically negative cases which, three or six months later, are diagnosed in other clinics as bronchogenic carcinoma

During August, 1947, a follow-up study was made to determine *the comparative value of* cytologic diagnosis and other accepted methods The total number of cases of bronchogenic carcinoma observed up to that time numbered 180 These were known cases of carcinoma based on bronchoscopic biopsy, exploratory thoracotomy, postmortem examination, and cytologic study All cases diagnosed by cytology were corroborated by one of the previously noted methods In 161 of the 180 cases, neoplastic cells were found in bronchoscopically removed secretion (89 7 per cent) The number of positive bronchoscopic biopsies totaled 71 (39 4 per cent) A diagnosis of carcinoma based on anatomicopathologic changes, namely bronchoscopic findings of deformity, stenosis, fixity or rigidity, was made in 42 cases (23 3 per cent) A positive or inferential diagnosis of carcinoma by bronchoscopy, therefore, was made in 113 cases (62 8 per cent), while a positive cytologic diagnosis was made in 161 (89 7 per cent), a difference of practically 27 per cent It is of further interest to note here that a *proportionately larger number of the* bronchoscopically negative, cytologically positive cases were amenable to surgical extirpation than of the bronchoscopically positive cases

The question immediately arises how many false positives were made by cytologic examination? In only one instance was a positive diagnosis of carcinoma made on the basis of finding what were considered neoplastic cells This was an error, as the case proved to be a chronic abscess of the lung Fortunately, the plan of therapy carried out was a suitable one for this *type of case*

Conclusion

The cytologic examination of bronchoscopically removed secretions is presented as a supplementary diagnostic aid to the procedures already employed in the diagnosis of bronchogenic carcinoma This method of examination must not be confused with studies of sputum Its greatest value obviously lies in that group of cases which exhibit roentgen or clinical evidences of bronchogenic carcinoma but which are completely inaccessible to bronchoscopic visualization. It is our opinion that, when more frequent roentgen studies of the chest are made and when all patients with questionable shadows in the lung fields are subjected to bronchoscopy so that secretions may be secured for cytologic examination, the diagnosis of bronchogenic carcinoma will be made earlier, more patients will be discovered who are suitable for surgical treatment, and the prognosis of bronchogenic carcinoma will become more hopeful

CURE RATE IN LUNG CANCER

RICHARD H OVERHOLT, M D , and IVAN C SCHMIDT, M.D , Brookline, Massachusetts

(From the New England Deaconess and Pratt Diagnostic Hospitals)

EVERY practicing physician shoulders part of the cancer burden Patients look to us, individually and collectively, for advice and help if they fall prey to this dread disease Until the time when science gives us a preventative against cancer, progress in treatment must depend upon earlier detection and immediate and skillful application of known weapons, principally excision

Cancer in any location, therefore, presents a challenge If the original site is in one of the internal and vital organs, the ingenuity of both the doctor who finds it and of the surgeon who removes it is taxed to the limit Malignant lesions which take origin within the lung probably provide as great a challenge to the profession as any because (1) the lung is an extremely common location for cancer, (2) five-year cure rates are high if localized when treated, and (3) there is a practical way to discover lung cancer before patients know they are sick

The issue of primary lung cancer is being forced upon us by the sheer weight of its frequency Within recent years most practicing physicians have encountered cases in their practice or have had its first hand acquaintance in some way Lung cancer has been shown to be second in frequency to stomach cancer Boyd after evaluating various autopsy series states that "Thus it might appear that bronchial carcinoma is nearly three times as common now as it was before 1920 "[1] Ochsner, Dixon, and DeBakey after a review of the mortality statistics of all persons dying in the United States found that "bronchiogenic carcinoma is increasing more than other malignancies Whereas in the period 1920 to 1936, inclusive, the incidences of carcinoma of the stomach, duodenum, liver, gallbladder, uterus, and skin showed little or no increase, the incidence of carcinoma of the lung showed a progressive rise "[2] Dorn has estimated that over 13,000 persons in this country are under medical care due to primary cancer of the lung and that 8,000 new cases come under observation each year [3]

As short a time as fifteen years ago, lung cancer was always fatal As short a time as ten years ago, it was not possible to read about five-year cures Most clinical discussions concerned themselves with a correlation of terminal findings and symptoms of the later stages of the disease Then came the practical demonstration by Graham, Rienhoff, and Overholt that the entire lung could be used as an excisional unit and was applicable in treating cancer [4-6] It remained to be shown just how effective a weapon excisional therapy would prove to be It was soon found that less than half of the cases studied were suitable for possible treatment, and the finding of an extrapulmonary extension at exploration reduced even more the number in which there was any likelihood of cure For example, in our own series, out of a total of 481 verified cases, only 55 (11 per cent) were found to free of an extrapulmonary extension (Table 1)

Valuable time seemed to have been lost between the onset of symptoms and the date of diagnosis An analysis of the histories of 133 patients seen between 1932 and 1942 revealed that there was an average interval of eleven and three-quarters months between the first symptom and the establishment of the diagnosis The average patient delayed seeing a doctor for three months The first x-ray was not ordered until another three months had elapsed. The diagnosis was established five and three-quarters months later Often the first or second x-ray was inconclusive, and the radiologist would continue re examinations after varying time intervals Not infrequently, a negative bronchoscopic examination would be repeated after intervals of several weeks in an effort to provide an absolute histologic diagnosis A review of the histories of patients seen in 1947 and 1948 showed the interval between the first symptom and the date of diagnosis had only been reduced to ten months

The average patient delayed seeing a doctor for three and eight-tenths months The first x-ray was ordered one and six-tenths months later, compared with an interval of three months in the earlier group However, the diagnosis

TABLE 1 —PRIMARY CARCINOMA OF THE LUNG 1933 TO 1948

	Number of Cases	Operative Mortality
Total	604	
Verified	481	
Unverified	123	
Explored only	127	15 (11.8%)
Resected	162	29 (17 9%)
Without extrapulmonary extension	55	
With extrapulmonary extension	107	
Total thoracotomies	289	44 (15 2%)

Presented by invitation at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Session on Chest Diseases, May 20 1948.

was not established until four and six-tenths months later

Delays in diagnosis have been reported in other series. Bjork states that in an analysis of 112 cases who passed through the Brompton and the Royal Cancer Hospitals in London as recently as March, 1944, to June, 1945, an interval of eight and four-tenths months elapsed between the onset of symptoms and the time of diagnosis [7] Patients on the average asked for help three and four-tenths months after onset of symptoms The doctor, however, treated the patients under an incorrect diagnosis for an average period of five months.

In times past there can be some forgiveness for the long delay in the establishment of the true diagnosis The following factors influenced the time factor in reaching a diagnosis

1. There was an understandable lack of interest in what used to be a hopeless form of cancer

2. The disease fails to produce a pathognomonic early symptom When the first symptom does appear, it is usually one of the common complaints encountered in cigarette smokers or people with chronic colds, sinusitis, bronchitis, or bronchopneumonia Chronic cough frequently is the only symptom for a long interval Such developments as the production of expectoration, wheezing, or even chest discomfort are not alarming and, therefore, do not stimulate the patient or doctor to quick action.

3 In the past our clinical concept of lung cancer was based on knowledge of the disease in its later stages The so-called characteristic symptoms, such as hemoptysis, chest pain, dyspnea, and weight loss usually do not appear until the lesion is advanced or out of bounds Waiting for such symptoms to develop and then forcing the issue has contributed to many delays

4. Reliance has been placed on the element of time between x-ray films to add greater certainty to the radiologic opinion The behavior of abnormal x-ray densities over a period of time aids greatly in the evaluation of the tuberculous or inflammatory lesion. The loss of time which has seemed to be necessary to work out an absolute x-ray diagnosis is of little consequence in many forms of chest disease Intervals of weeks between serial films when x-ray changes are due to bronchi being blocked by tumor is quite a different matter

5 Secondary infection distal to the lesion frequently takes place, since most tumors soon cause segmental or lobar bronchial obstruction This has led to many errors in diagnosis and delay Unresolved pneumonia, lung abscess, bronchiectasis, empyema, or pleurisy have all masked an underlying tumor

Although delays in suspecting and apprehending lung cancer could be justifiably excused in the past, future generations of victims may not be so tolerant of our methods of sorting out potentially fatal lung disease and finally deciding on curative treatment The orthodox method of waiting for symptoms, then waiting for a failure of the usual remedies to correct them, then the delay that seems to have been necessary to work out the differential diagnosis has not produced results

Difficulties have also been encountered in making a substantial shift in the preponderance of late to early cases of cancer of the esophagus, stomach, colon, prostate, or other internal organs These are well known. The medical profession has had to depend upon (1) a lesion of sufficient age to produce symptoms, (2) symptoms of sufficient severity to warrant a call on the doctor, (3) signs sufficiently obvious to excite the doctor to arrange for special diagnostic procedures, and (4) positive evidence of cancer by special tests

In a recent report on carcinoma of the stomach by Welch and Allen it appears that by the time symptoms induced patients to ask for help and by the time the doctor instituted treatment, only half could be resected, and five-year survivals were only 7 per cent of the total seen [8]

Now we are in the early stages of development of visceral thoracic surgery It can already be shown that five-year survival rates following pneumonectomy for lung cancer are as high as the figure for gastrectomy for stomach cancer In the future we should do much better for the patients suffering from lung cancer There are reasons for optimism concerning the future of lung carcinoma based on present knowledge and methods of combating it

The case-finding program now used in tuberculosis work is immediately available For some time phthisiologists have realized that the only solution for early diagnosis in tuberculosis rests with finding asymptomatic or silent disease Down through the years, about the best record that could be shown by waiting for symptoms and then for a differential diagnosis was around 15 per cent for minimal disease This meant that, when treatment was started, approximately 85 per cent of all cases were in the advanced stages Screening the healthy population for silent yet active disease has reversed this ratio Eighty-five per cent of the cases are now being discovered during their early and therefore more favorable stage

The mechanism for screening larger segments of the population is being rapidly set up Many hospitals are routinely x-raying all admissions Mobile units are busily engaged in industrial surveys, and entire communities are being used for pilot studies The practice of routine in-

duction and separation x-rays for military personnel in the last war acquainted every family in this country with the concept of searching for silent disease The stage is all set for screening for other types of lung disease The same case-finding program that has been designed for tuberculosis will automatically uncover many cancers of the lungs In order to be more fruitful, emphasis must be placed on the older age group, and the screening should be repeated each year Once abnormal shadows are spotted, modification of the sorting out process may have to be made. Time cannot be lost in properly identifying lesions since early cancer must be entertained as a possibility

Will early lesions be detectable in survey films? Fortunately, all primary lung cancer is bronchogenic in origin. Furthermore, approximately 80 per cent of the lesions are situated in a lobar or segmental bronchus This means that, because of their strategic location, most small lesions will soon cause partial or complete obstruction Very early in the course of the disease changes in the density of the entire segment or lobe take place Segmental emphysema due to the check valve mechanism of the bronchus-occluding lesion will be seen in some films (Fig 1) Soon atelectasis of the segment develops when the obstruction is complete This produces even more obvious a sign of trouble These changes are the telltale evidences which give away the small and early tumor Small pea-sized or lima-bean-sized lesions within the hilar zone, whose shadow might be lost because of the superimposed densities of great vessels, bronchi, and lymphatic glands, need not be recognized per se The secondary effects in the periphery of the segment supplied by the occluded bronchus are sufficient to call the patient in for further investigation

The minority group of cancers which take origin in bronchi of lesser size in the periphery are out far enough in the lung field so that the tumor itself, even of minute size, will cast a shadow that can be picked up in the survey film Therefore, there is good reason to believe that the screening process can provide a practical method of finding lung cancer months or years in advance of symptoms, and for many patients this will mean discovery during its localized stage

The inherent possibilities of screening silent chest disease and the influence it will have on successful management present a real challenge to our profession Every doctor should be aware of and accept this new obligation It is twofold first—to support in every way possible the mass survey work that is in progress The plan should be extended through arrangements with radiologists in hospitals or their private offices to include the screening of each doctor's own adult

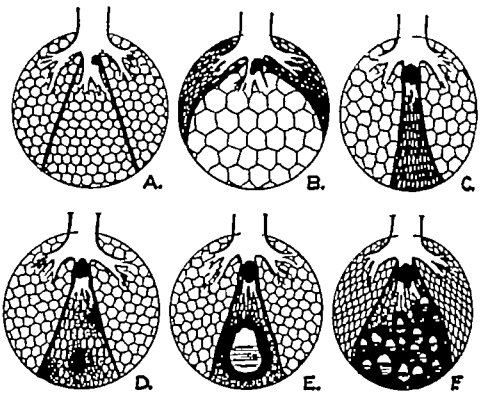

FIG 1 Diagrams which indicate strategic location of the great majority of bronchogenic carcinomata The secondary effects magnify a small lesion and in that way create telltale abnormal shadows on the chest film *A* Relation of lesion to bronchopulmonary segment or subsegment *B* Partial obstruction with check valve mechanism causing segmental emphysema *C* Complete obstruction causing segmental atelectasis *D*, *E*, and *F* Superimposed secondary infection with pneumonia, abscess, or multiple inflammatory lesions.

patient population once a year Second to follow through with immediate supplementary studies of abnormal densities so that they may be properly labeled All instances of abnormal lung or hilar shadows showing up in survey films demand conventional fluoroscopic and roentgenographic studies Then if there is any reasonable likelihood of cancer, additional studies should be arranged for without delay—cytologic examination of the sputum (Papanicolaou), bronchoscopy, and exploratory thoracotomy

The earlier and the more favorable a cancer is for treatment, the more difficult it becomes to obtain tissue for histologic verification before thoracic exploration In many early cases the lesion will not be visible or suitable for bronchoscopic biopsy The correlation of surgical pathology and the cytologic examination of the sputum has not been carried out in a sufficient number of early cases to appraise its true value Experiences with this diagnostic method do show that it is extremely useful in verifying a presumptive diagnosis today However, the number of patients in the various series so far reported are patients who are in the symptomatic or advanced stage of the disease As with all laboratory procedures, a positive test gives assurance to the surgeon prior to operation, but negative tests do not guarantee the absence of an early cancer Therefore, if the x-ray has provided presumptive evidence of a peripheral tumor or of segmental or lobar bronchial obstruction, exploration should be resorted to as the final court of appeal

FIG 2 X-rays and lung specimen of Mr E B, age sixty-four Routine hospital survey films taken when patient was admitted for study of thrombosed vessel of leg No chest symptoms were present Note primary carcinoma which was found in superior division of right lower lobe

FIG 3 X-ray and lung specimen of Mr J J C, age sixty-four The lesion in the single postero-anterior view was caused by an epidermoid carcinoma, grade III Note small size of the lesion in the surgical specimen and the much larger area of increased density appearing in the chest film.

FIG 4. X-rays and lung specimen of Miss C B, age fifty-six. Routine chest films taken in doctor's office Patient came in complaining of weight loss but had no symptoms relating to the chest Bronchoscopic and cytologic examination of the sputum was negative An epidermoid carcinoma, grade III, with involvement of mediastinal glands was found upon exploration

Efforts to speed up early discovery of primary carcinoma of the lung will be rewarded Two facts support this statement. First, five-year survival rates for patients treated by lung resection prior to the finding of an extrapulmonary extension of the growth are high. Second, the immediate risk of resection of the lung has been brought down to a reasonably low level.

Although it is necessary to go back to the early days of visceral thoracic surgery to appraise end results of resection for cancer, it is significant that 40 per cent of those patients in whom there was no demonstrable evidence of cancer outside of the lung survived for a period of five or more years (Table 2) This is most encouraging, for these patients had symptoms, and undoubtedly the treatment was carried out at a time definitely later than would have been the case if they all had been discovered when their lesions were silent Two of ten patients who had lymph node metastases only have lived more than five years (For specific illustrations of the authors' cases, see Figs 2, 3, 4, and 5)

As the mechanism of discovery is being accel-

FIG 5 X-rays and photograph of Mr F R, age fifty-five. The x-ray was taken as a part of a routine examination in a doctor's office Patient had had an attack of grippe which "hung on" The lung with an early cancer was removed eight weeks after the onset of symptoms. The patient is well now, nearly five years later

TABLE 2.—PRIMARY CARCINOMA OF THE LUNG 1932 TO 1943

	Number of Cases	Operative Mortality	Five-year Survival
Total	234		
Verified	190		
Unverified	44		
Explored	58	9 (15.5%)	
Resected	41	9 (21.9%)	
Without extrapulmonary extensions	20		8
With extrapulmonary extension	21		3
Total thoracotomies	99	18 (18.1%)	

erated, technical problems of anesthesia, dissection, postoperative care, and the administration of the antibiotics have contributed greatly to the safety of the operation For example, in the period 1932 to 1943 the operative mortality was 21 9 per cent in all cases of total lung resection for all types of cancer The authors' mortality in the past two years has been reduced to 11 per cent (45 total lung resections, five deaths)

Summary

The lung is a common site for the development of cancer Until science gives us a preventative drug, success in management must depend upon discovery in the pre-extension days of the growth Annual screening of the healthy adult population by mass radiography provides a method of detecting the lesion during its silent stages For many patients this will mean the discovery of the cancer before it has become out of bounds

Wide excisional therapy is available in the performance of pneumonectomy with mediastinal glandular dissection The operation is attended with a reasonably low risk and practically no disability or deformity When this operation has been carried out in patients whose lesion was found to be localized, there has been a gratifying five-year survival rate

Every practicing physician is presented with a challenge It is possible for him to find potentially serious tumors of the lung in his own patient population by arranging for annual logic screening This first obligation is fol by two others, the immediate and proper i fication of the various lesions spotted i screening process and then, finally, defi treatment for those whose lives depend upon action

In the identical period of the above study (1932 to 19 patients were treated by *pulmonary* resections for tumor nosed as bronchial adenoma infiltrative bronchial adeno *malignant* adenoma Some authors consider these tumor primary carcinomas (adenocarcinoma, grade I) and h *them* in their cancer statistics From a clinical point of they should receive special consideration. For example 27 patients have been followed recently and there ha *only one late death* This patient died of metastasis whi similar characteristics to the *bronchial tumor* One p has not been followed Ten of the remaining 25 pa have lived five to fifteen and a half years after operatio the adenoma series there were no operative deaths ther since immediate and late results are so totally different 'so-called adenoma group we have not included th *the above paper on true cancer of the lung*

Discussion on Symposium

Arthur Q Penta, M.D , *Schenectady* —The problem of bronchogenic carcinoma has been so completely and ably presented here that there is very little that can be added from the standpoint of discussion There are certain points, however, brought out by the speakers, which to me are important enough to warrant re-emphasizing Dr Auerbach stated that in his opinion the increase in bronchogenic carcinoma was rather more apparent than real. It is true that with special diagnostic procedures available today the diagnosis of bronchogenic carcinoma has been greatly facilitated Also because of the fact that there has been a steady increase in longevity, there are more potential victims to fall heir to the disease Recently, a very well-known pathologist told me that if we lived long enough we would all develop some form of carcinoma. True as this may be I feel that the increase in bronchogenic carcinoma is real It is interesting to note that in t past ten years, during which period the incidence bronchial carcinoma has been high, we have a witnessed the greatest industrial progress in t history of our country The workers of today e exposed to many more carcinogenic agents than th were in the past. When discussing the theories carcinogenesis, we must not overlook the fact th daily inhalations—for example, of chemical irritan such as found in tar and petroleum products, t many volatile acids produced from cigarette smo ing, the daily inhalation of air heavily saturated wi carbon particles from the exhausts of automobiles may lead to a chronic bronchial irritation fro which may eventually result cancer of the lung

The high incidence of bronchogenic carcinoma i men as compared with that in women has in recer years received a great deal of attention in th

literature. Had World War II lasted thirty years instead of nearly four, I believe we would have seen a greater increase in cancer of the lung among women since, in all probability, many more women would have been engaged in industry for a longer period of time, also the ever-increasing popularity of excessive cigarette smoking among women will not only result in the increase of chronic bronchitis and bronchiectasis but also in cancer of the lung

Regarding Dr Hayes' presentation on the clinical aspects of bronchogenic carcinoma, I should like briefly to make one comment regarding symptomatology It is well for the busy practitioner to remember that the symptoms produced in primary carcinoma of the lung will depend to a great extent on the degree of bronchial obstruction The most important early symptom is a dry, hacking cough, accompanied by a slight bronchial wheezing Physical examination during this early stage may reveal a few coarse moist rales and asthmatoid-like wheezing over the involved pulmonary area Roentgenographic studies of the chest during this stage may be entirely negative, since the tumor is not large enough to cast a shadow At this time the patient usually seeks medical advice because of the troublesome cough and wheezing It has been the author's experience, when obtaining a history of these patients referred for bronchoscopic examination, that they invariably had been under symptomatic treatment for a long period of time and had shown no improvement in their condition It has been repeatedly stated by that great teacher of bronchoscopy, Dr Chevalier Jackson, that "all that wheezes is not bronchial asthma." The importance of this one symptom alone cannot be too strongly emphasized. In a series of 44 cases of bronchial carcinoma, bronchoscopically examined by the author during the last five years, it was astonishing to learn that 15 of the patients, because of recent wheezing, cough, and slight dyspnea, had been previously treated for bronchitis or bronchial asthma Every patient, particularly of the cancer age group, presenting this chain of symptoms, should immediately be x-rayed and should have the benefit of a diagnostic bronchoscopy The appearance of blood-streaked sputum or frank hemoptysis are also frequent early symptoms and are usually due to the trauma of coughing and ulceration of the tumor mass. Pain, as in other malignancies in other parts of the body, is definitely not an early symptom In a recent study of the subject, Overholt calls attention to the fact that approximately three-fourths of all primary lung tumors are situated in the major bronchi so that they are within range of bronchoscopic vision His findings are in complete agreement with C L Jackson, who stated in a recent article that bronchoscopic biopsies will be positive in 75 per cent of the cases of bronchial carcinoma In the series of 44 cases examined by the author during the past five years a positive biopsy was obtained in 32 cases This high percentage of positive biopsies is definite evidence that bronchoscopic examination plays an important role in the diagnosis of lung carcinoma

One of the most significant advances made in the early diagnosis of bronchogenic carcinoma is the procedure described by Dr Clerf in the cytologic examination of exfoliated tumor cells from bronchial secretion It is astounding that Dr Clerf and his coworker, Dr Herbut, were able to make a positive diagnosis in over 89 per cent of these lesions which were beyond the range of bronchoscopic vision Since this method has been employed at the Jefferson College Hospital, Dr Clerf has been able to increase the total percentage of positive diagnosis by fully 27 per cent

Dr Clerf also speaks of some technical difficulties involved in the cytologic examination of aspirated bronchial secretion From my own experience I can safely say that in order to reach any point near the results obtained by Dr Clerf, it is highly important that there be a close cooperation between the pathologist and bronchoscopist Today the average pathologist in a busy general hospital has all that he can do to carry out the routine laboratory work and to attend to the many executive details necessary in directing his department This leaves him very little time to engage in special work, such as is required for cytologic studies Then, too, this type of examination offers a challenge to the ability of the examining pathologist The diagnosis of cancer cells in smears is not always easy Oftentimes the special stained smear will show only one recognizable cancer cell, and the examiner in many instances will be reluctant in giving a positive diagnosis Specially trained personnel is required before reliable diagnoses can be made - The bronchoscopist must also have a thorough knowledge of the segmental anatomy of the lung He must be able from the roentgenographic study of the chest to determine which segment of the lung is involved. Dr Clerf stated that in an effort to increase the number of positive diagnoses in pulmonary lesions which exhibited roentgen appearance of carcinoma, but in which the bronchoscopy proved negative, bronchial lavage with examination of the aspirated secretion has proved of great value in establishing the diagnosis of carcinoma In my own practice I frequently encounter infiltrating lesions in the apical regions of the lungs which are diagnosed as tuberculous in character but later turn out to be carcinoma. How about those infiltrating lesions at the base of the lung which resemble bronchiectasis but later turn out to be carcinoma? The point that I wish to make clear is that there is no definite early characteristic radiographic appearance of carcinoma of the lung If we are to diagnose this condition early, in the stage of operability, we should routinely carry out a cytologic examination of all patients in the cancer age group who are referred for bronchoscopic study In certain instances where the chest roentgenograms have shown a definite tumor-like shadow but in which the bronchoscopic examination was negative, I have recommended exploratory thoracotomy in an effort to establish the diagnosis In the hands of well-qualified thoracic surgeons this procedure has no greater mortality than exploring the abdominal cavity There is much to be said for this type of procedure in establishing an early diagnosis

Walter F Bugden, M.D , *Syracuse* —These four

papers have thoroughly covered the subject under discussion

Dr Hayes has very systematically pointed out the many symptom combinations that may occur with bronchogenic carcinoma and the usual steps one must take to make a proper diagnosis I feel that a good working assumption is that all unexplained x-ray lesions in patients over thirty-five are carcinomatous until proved otherwise The lesion that presents as a segmental pneumonitis is the most disturbing to me Is it simply inflammation or is it carcinoma with infection distal to the tumor? This type case causes me considerable concern My present policy is one that might be thought too aggressive by some I advise three or four weeks on antibiotics, and if the subsequent x-ray is not virtually clear, exploratory thoracotomy should be done Most cases of pneumonitis will clear in three or four weeks I agree that chronic nonspecific pneumonitis occurs not infrequently, but just recall to your minds all of the carcinomas that you have seen treated for more than six weeks as unresolved pneumonias, until they reached the inoperable stage

A gem that appeals to me came from a good roentgenologist who said, "I never make an x-ray diagnosis of pneumonia until the subsequent films show clearing" If only more physicians appreciated the full meaning of that statement, our operability per cent would climb If a noncarcinomatous lesion is occasionally explored and resected, there is no need for apologies, the patient was best served by such alertness

Dr Clerf and his pathologist would probably be able to establish a cytologic diagnosis more often than many thoracic clinics His clinic reports 89 per cent positive cell studies out of 180 prove cases Our group has not approached that figur

However, since this technic of cell study is vu nerable in the hands of others, I take the stand th one or two or three negative bronchoscopic ce studies does *not* exclude cancer, and we again con to surgical exploration as our definitive diagnost measure Dr Clerf's contribution to our diagnost armamentarium is a real one on the side of positiv biopsies, but I repeat that I am not yet sold on th actual negativity of the negatives

Dr Auerbach has given us a concise picture of th pathology involved In my own series I have see more squamous carcinoma than undifferentiated c adenocarcinoma combined I have never had on case of the "oat cell" type that I could resect, but have observed worthwhile symptomatic palliation i some "oat cell" cases with deep therapy

I should like to mention lipiodol instillation onl to condemn it It may confuse future x-ray inter pretation

My feelings are much the same as Dr Overholt's I feel optimistic about the future of bronchogeni carcinoma because mass radiography of the chest i so practicable And as soon as the full significanc of early segmental changes are better appreciate as being so often due to bronchogenic carcinoma, th better our surgical statistics will be

I should like to enter a plea for lobectomy versu pneumonectomy in selected cases for physiologi reasons Dr E Graham has opposed this on th grounds of it being poor cancer surgery, comparing it with simple mastectomy versus radical mastec tomy I don't think the analogy is a fair one In gastric carcinoma we are contented with partia gastrectomy which is a better comparison

---

DR. JONES SAYS—

A lady that reads these emanations of mine "This time of year," she said recently, "shouldn't you be saying something about colds? You usually do" She, maybe, thought I was getting forgetful No, it wasn't that. It's some like Grandpa Pepper said about going hunting "I go once or twice a year," Grandpa says, "but I never seem to hit nothin', so I always wonder if it's worth while." But, possibly, if we keep shooting, our aim might improve

We used to hear debates over whether colds came from wet feet, drafts and so on, or from germs By now I guess most everybody's got that straightened out It's ordinarily a combination of both. It's "germs" that cause it—a virus, usually aided and abetted by various bacteria that're hanging around, but—especially folks that're indoors mainly —getting wet and chilled lowers their resistance to the virus. Now that they've isolated what seems to be *the* virus they may develop a protective vaccine that'll really work.

For all our precautions and in spite of the progress of science, it'll be a long time before the "common cold" will be uncommon In the meantime there's one thought with no if's attached to it. Colds are unpleasant but it's the complications that're dangerous.

When we get a cold, the best way to avoid complications is to lay low, preferably in bed, 'til the acute stage is over And we'll be unselfishly keeping our virus to ourselves —*Paul B Brooks, M.D , January 17, 1949*

THE ROLE OF PHYSICAL METHODS IN DIAGNOSIS

HERBERT KENT, M D , New York City

(From the Department of Rehabilitation and Physical Medicine, Third Division, Bellevue Hospital)

THIS topic is so general in its scope that the discussion must be limited to physical methods as used in physical medicine, and, more particularly, the diagnosis of peripheral vascular and neuromuscular disturbances will be described.

Knowledge of the status of the peripheral circulation is often the most desirable, and a number of physical methods have been devised toward this aim. Consequently, we have many approaches depending on the information necessary for a clinical conclusion

The first is the oscillometer, and because of its importance further details in its use will be mentioned. The oscillometer is a device for demonstrating volume and pulsation changes in the extremities It is essentially a sphygmomanometer of the aneroid type and may also be used in blood pressure determinations In addition, it can measure the amplitude of arterial pulsations at various levels of a limb

This instrument is more sensitive than the palpating finger The thrust imposed on the peripheral vessels by the cardiac cycle produces a volume increase depending on the gradient of the vascular tree The instrument can detect this alteration as transmitted by the great and small arteries in the limb When vessels are of large diameter, as in the upper thigh, the volume increase is naturally greater In the lower portion of the leg, the smaller volume is reflected in a shorter excursion of the dial pointer on the instrument This is a valuable aid in arterial disease, notably in thromboangiitis obliterans and arteriosclerosis During the course of disease it permits quantitative studies In limb surgery, sites of election for amputation may be determined readily by utilizing the oscillometer

Correct technic for using this instrument is most important, or misleading information may be obtained It is necessary to emphasize that patients must be examined at rest in the recumbent position with no pillow and at the same level cross section of the limb (Fig 1) Time of day is also an important factor, since readings may vary in the morning from those taken at night Additional factors to be considered are cuff pressure and room temperature

Oscillometric readings are taken by elevating the needle pointer to 50 mm above the patient's systolic pressure The pressure is allowed to fall 10 mm at a time, as is done with a sphygmomanometer The button is then depressed on the side to determine the oscillation of the pulse at that pressure (Fig 2) This activates a more sensitive device for recording the pulse wave The maximum excursion of the pointer and the pressure are read When this point is passed, there is no need to follow the pressure to zero

The greatest number of units passed at each swing of the pointer gives us what is known as the oscillometric index This index is important only in so far as it allows comparison with the opposite extremity or with the normal As an aid to diagnosis, it is this comparison or relative value which gives us the information regarding the arterial sufficiency of the part, normal values having been established

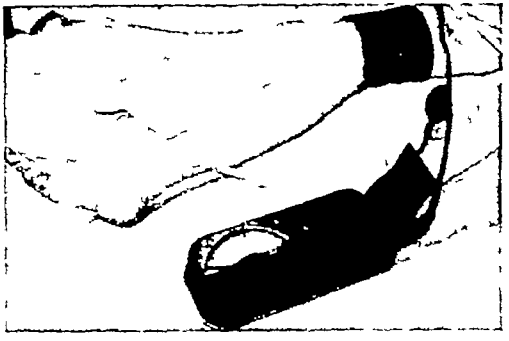

FIG 1 Oscillometer attached to lower third of thigh and inflated

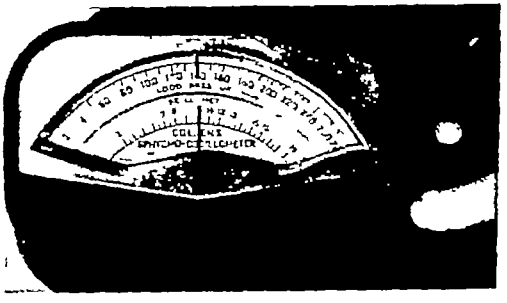

FIG 2 Blood pressure cuff applied Depress the lower right button to determine the oscillation of the pulse at that pressure.

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Session on [illegible] 10, 1942

An average "normal" oscillometric index taken, for example, in the lower extremities, is as follows

Thigh	
Upper third	14
Middle third	12 ± 20 per cent
Lower third	10
Leg	
Upper third	7
Middle third	5 ± 20 per cent
Lower third	3

However, to repeat once more, it is the relative change that gives us a criterion to establish insufficiency in a limb

Another means of measuring blood flow in the peripheral arterial system is by the use of the electrothermometer [1] This method is indirect, but the advantage is its applicability to the ambulatory as well as to the bed patient It can readily be carried out by the physician in his office, as compared to the other methods which have been employed in volume blood flow studies

There are many such devices Some may be read directly in fahrenheit or centigrade degrees, others require conversion Essentially, they contain two thermocouples, one of which measures the temperature of the skin with the other used as a constant This latter may be immersed in a thermos flask of known temperature, or a cold junction may be used The thermocouple utilizes the electromotive force generated when the junction of two dissimilar metals are maintained at different temperatures and is measured by a galvanometer More usually the principle of the Wheatstone bridge is applied Exact calibration is essential

The technic is relatively simple if attention is paid to certain factors as room temperature, equal skin contact, and skin dryness One area of the skin is compared to a similar area on the opposite side, and repeated readings are taken

Landis and Gibbon initiated a test for the differentiation of arterial impairment in a limb,

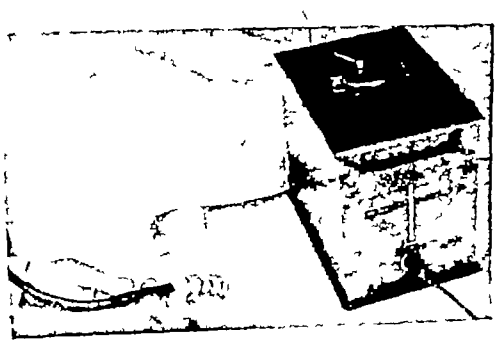

FIG 3 Electrothermometer—in use during Landis-Gibbon test

either on a functional spastic or an organ obliterative basis [2] The procedure is to dete mine digital temperatures of the great toe befo and after immersion of the hand and forearm water at a temperature of 115 F (46 1 C) f twenty minutes (Fig 3) Organic arter disease is inferred by the absent or slight rise temperature indicating gross involvement of t vessels A normal rise, i e , to 95 F (35 C), su gests vasospasm An intermediate rise indicat the likelihood of partial obliterative diseas Another important diagnostic use of surface ten perature determinations is the evaluation sympathetic nerve block, vasodilator drugs, an physical therapy procedures

A further approach to knowledge of the vesse at the periphery is possible through the phenom ena of fluorescence Fluorescein (resorcino phthalein) is a dye which is fluorescent whe viewed in the dark beneath an ultraviolet gener tor covered with a glass filter containing nick oxide (Wood's Filter) [3] This phenomenon ca be used for circulation time studies and in pr viding additional information in patients wit peripheral vascular disease [4]

In this method the dye is injected intrave nously For determining the circulation tim the completion point is indicated by the sudde appearance of a bright, yellowish fluorescence o the inner margin of the eyelids and with brigh vertical lines in the tiny capillaries of the iri In peripheral vascular disease, the normal glo may be absent in that area of skin served by a artery which contains an embolus or is scle rosed

Apart from instrument utilization in diagnos ing cardiovascular conditions, various methods o exercise have been employed For example, in doubtful case of angina the patient can be exer cised with the view of bringing on the distress This can be performed by having the patien walk upstairs until pain is produced

Claudication time may be obtained by measur ing the time taken to produce the typical distress of pain in the muscles of the calf Likewise, anginal attacks may also be evoked by having the patient breathe an atmosphere poor in oxygen content (10 per cent) for ten to twenty minutes This also can be a useful diagnostic method for potential cardiacs who request an opinion as to the advisability of air travel

In addition to exercise tests, postural tests for circulatory efficiency have been suggested A simple and rather useful test in circulatory disease diagnosis is postural effects on the color of the skin of the extremities In the lower extremities, a simple test of circulatory impairment is to have the recumbent patient elevate his feet above his head Skin color change is watched for after a

suitable interval Then the patient hangs his legs over the edge of the table or bed Normal color should return in fifteen seconds Arterial circulatory impairment in the upper limbs may be detected by clenching the hands ten times when elevated above the head If the skin of the volar surface of the hands is blanched excessively and uniformly, generalized impairment is suggested Pressure on the radial artery at the wrist and on the ulnar may give a clue as to which vessel is diseased Patchy or irregular blanching indicates local occlusion, e g, in the digital arteries.

Another type of test, employing cold as a stimulus to the vascular system, is the cold pressor test.[5] This is useful in early hypertensive vascular disease

The rise of blood pressure (mainly reflex in origin) produced by cold is determined as follows the subject rests in the supine position for twenty to sixty minutes in a quiet room so that his pressure falls to basal level A sphygmomanometer cuff is wrapped around one arm One hand is immersed in iced water (at 4 C) to a point just above the wrist The blood pressure is then read at thirty- to sixty-second intervals The hand is removed from the water, and blood pressure readings are taken every two minutes until the basal level is regained In normal subjects, the maximal rise occurs after thirty seconds, and the rise is over in two minutes A rise exceeding 20 mm. of mercury systolic or 15 mm. of mercury diastolic is an excessive reaction.

As we have seen, knowledge of the state of the circulatory system has been sought through devious routes Most of these have employed visual means A further approach can be instituted by way of special photography

Since the human eye can only capture and respond to visible radiation in the form of images, a method has been developed to extend our range into the infrared zone by means of photography with infrared sensitized plates It is now possible to study the superficial and not too deep vascular system.

Most of the technics which have been evolved relate generally to the arterial side of the cardiovascular system. Infrared photography, therefore, has a particular application to the venous side of our conducting system, a major portion of which is superficial in the body Because of this, a simple means of studying the radiant transmission by the skin is offered to us By the appropriate technic, varicose veins, skin tumors, superficial vessels in the breast and abdomen of pregnant women, and progressive thrombosis can be readily outlined In cases of suspected early obstruction of the vein, the collateral circulation can be demonstrated.[6] Also, some

(By courtesy of H. L. Gibson Medical Radiography and Photography 1945)

FIG 4. *Patient, age sixty-two years, shows very early Paget's disease of the left nipple* Note indications of increased blood supply to the tumor region

estimation of the healing potentialities of indolent ulcers or skin areas for grafting may be gathered *this way In the early diagnosis of skin malignancies* or neoplasm in the underlying structures, as Paget's disease of the nipple, we can expect zonal venous markings which are abnormal (Fig 4) This increased vascularity should make us *suspicious enough to ask for a biopsy*

Physical methods which can be employed in vascular problems depend upon what segment of the circulatory system one desires to investigate Similarly, the nervous system can be objectively studied In this case, the principal means is to examine the electrical reactions of nerve and the electrical activity of muscle

The principal use of electricity in the diagnosis of nervous disease is to afford confirmatory evidence (*a*) when a lesion of the lower motor neuron is present, and (*b*) in rare diseases of muscles, e g, myasthenia gravis

The electrodiagnosis of muscle and nerve is carried out by means of the faradic (alternating) and galvanic (direct) currents The faradic current causes a tetanic muscular contraction as long as the current is in motion. The galvanic current only causes a contraction when the current is made or broken but not when it is passing through the muscle Either current is usually applied over a motor point, i e, supposedly where the nerve enters the muscle, but may be applied where the best response is obtained It must be borne in mind that various electrical reactions are produced in lower motor neuron lesions, myopathies, and other rare conditions They do not, as a rule, occur in upper motor neuron lesions

In muscle or nerve injuries, the electrical *reactions are of extreme importance in diagnosis* and prognosis of these components When a nerve undergoes Wallerian degeneration, an

altered electrical reaction is obtained which is known as the reaction of degeneration or, simply, R.D Since the reaction of degeneration (R D) gives us knowledge of the conductivity of impulses in the peripheral nerve fiber, a clear understanding of its significance bears repetition

Reaction of degeneration can be either partial or complete Since some individuals prefer a classification of full, partial, or absolute, this may be mentioned However, for the sake of simplicity, degrees of partial degeneration are grouped under this latter term The different stages of nerve degeneration will cause variegated responses depending on the amount of damage to nerve cells or fibers Also, where partial R D is present, greater skill and considerable experience in the interpretation of the findings is necessary It must be emphasized, furthermore, that for degeneration to occur, sufficient time must elapse, otherwise erroneous values are obtained Simply stated, if the nerve has undergone complete degeneration, the muscle shows (*a*) no response to both faradic (a c) and galvanic (d c) currents and (*b*) repeated negative response after a suitable interval, i e, one year

Partial R D may be present in a nerve undergoing degeneration up to two weeks after the initial injury and complete R D from about fourteen days onward The R.D, irrespective of degree, can be considered to be partial when there is a diminished response to faradic and/or galvanic stimulation. Many variations of this are seen, e g, the myopathies are diminished quantitatively, in myasthenia gravis there is a slow failure to contract after application of the faradic current, in myotonia congenita the contraction continues after the cessation of current, in tetany there is an increased excitability Generally speaking then, the characteristics of partial R D are (*a*) loss or diminution of response to faradic (a c) current and (*b*) sluggish response to the galvanic (d c) current The significance of reaction of degeneration is that partial R.D cases may recover, complete R.D cases have a relatively hopeless prognosis as regards the recovery of the particular nerve

Another and more accurate method of following degenerative changes in nerves is measurement of chronaxie Chronaxie is the time during which a current, twice as great as the rheobase, must flow to excite a muscle Rheobase is the weakest direct current in volts which will activate a muscle indefinitely In addition, substantial information in neuromuscular disorders can be sought by means of strength-frequency curves, as these electrical determinations are both sensitive and quantitative [7] Absolute values can be obtained, provided the technic is standardized Nevertheless, there are greater possibilities of error, and consequently, these should be regarded as laboratory procedures Strength-duration and strength-frequency curves have been found to consist of more than one component by utilizing extremely sensitive apparatus One of the most reliable guides of muscle excitability is the strength-duration curve Its advantage is that the curve can show the commencement and changes in innervation of muscle excitability before being observed clinically

A comparatively new method of electrodiagnosis has come into vogue which makes use of the electromyograph [8] Many workers have shown that voluntary muscle tissue demonstrates electrical activity When the muscle becomes fibrosed, none can be obtained Since the potentials are low in voltage, they consequently require considerable amplification. To record these, an ink-writing device can be employed, or they can be reproduced in visible form on the fluorescent screen of a cathode-ray oscillograph and then photographed Needle or surface electrodes are used to detect this activity

Using these technics, characteristic data have been secured In addition to the characteristics of denervated muscle, normal kinesiology of individual muscles has been determined [9] As an aid in the diagnosis of peripheral nerve injury it has been found that fibrillation action potentials in the absence of motor unit action potentials are indicative of a complete lower motor neuron lesion When muscles show a complete reaction of degeneration, this information can be of considerable value in prognosis When the injured peripheral nerve commences to regenerate, a combination of fibrillation and polyphasic motor unit action potentials appear Fibrillation remains vigorous until early reinnervation and then disappears By this method we can determine the electrical activity of muscle before there is a change in the R.D

Localization of nerve root injury due to compression may prove most useful Furthermore, data for differential diagnosis in various neuromuscular disorders, e g, Parkinsonism, progressive muscular atrophy, and amyotrophic lateral sclerosis, can be made available This method has also been of great help in following the effects of medicaments injected into the body, e g, curare in poliomyelitis, intravenous procaine in muscle spasm, etc

Two relatively recent advances have been made in regard to blood diagnoses the electrophoretic property of the blood has been explored, and the use of radioactive isotopes has and is being investigated Electrophoresis or the migration of particles in fluids has led to the fractionation of blood serum Using this method, chemical and physiologic experiments have been qualitatively

and quantitatively analyzed The great hope is that some day it may prove particularly useful as a means of isolating and purifying viruses

Radioactive isotopes or "tagged substances" are being made use of at present in diagnostic and medical research. A long list of these is available, carbon, phosphorus, iron, sodium, and iodine are a few that can be mentioned which have given valuable information in metabolism as well as cancer studies Three principal technics have been employed (1) autoradiographic, where tissues containing tracers are photographed, (2) in vitro method, where the residues are measured for activity, and (3) in vivo method, where the Geiger counter is used Using these methods hitherto unapproachable problems can now be attacked.

Since the Geiger counter has been mentioned, perhaps a few remarks concerning its use may be made here. This method consists of an electrical means of counting alpha particles The original apparatus was modified for cosmic, x-ray, and gamma ray studies A special counter tube was devised and placed in a circuit arrangement with an electrometer This tube is essentially a diode filled with gas at a low pressure The gas content and voltage across the tube are so adjusted that entry or release of a single charged atomic particle such as an electron, proton, or alpha particle between the electrodes produces ionization. This causes a rapid discharge of a comparatively large quantity of electricity across the interelectrode space The manifestation can be visualized or made audible

Perhaps one further word may be mentioned here while on the topic of atomic medicine As we enter the new age of atomic physics, something has been shown as to how radioactive isotopes or "tracer substances" are being employed in the study and investigation of both physiologic and pathologic processes Their maximum aid in diagnosis is yet to be realized

The Geiger counter was the first practical tool for the detection of radioactivity Simpler and more convenient forms, as the Minometer Ionization Chamber, are being used by those handling or coming in contact with deleterious radiations An undue quantity of these radiations can result in profound changes in the blood

The Minometer is a pen-sized ionization chamber that measures individual absorption of scattered radiation It permits a reading up to 0.2 r units per day The daily tolerance dose for atomic energy and other workers in this field has been estimated at 0 1 r per day For obvious reasons, it is most useful for x-ray and radium workers This new pocket device comes in two parts, string electrometer and ionization chamber This latter acts as a condenser which, when inserted into the electrometer, is given a charge to a definite voltage When radiation is present, the ionization of the air within the chamber causes the voltage to "leak off" When this is reinserted in the electrometer, the voltage change is indicated on the scale in roentgen units

By using this method in the diagnosis of excessive radiations, we have one of the best insurances against tragedies that could have been prevented

Summary

A discussion of the methods as used in physical medicine for the diagnosis of various conditions has been presented Particularly in the diagnosis of circulatory and nervous disorders, they have been found to give very valuable information Certain established technics have been stressed where indicated

Discussion

Sidney Licht, M D , *Cambridge, Massachusetts (By invitation)* —If physical medicine is to continue as a specialty in more than name only, it must prove itself indispensable to other branches of medicine, and its specialists must prove that they can do certain things better than general practitioners, other specialists, and physical therapy technicians The importance of this paper is in its title, for diagnosis, if adequately pursued by the specialist in physical medicine, will win respect and permanence for him. The physical medicine specialist must develop manual skills and interpretative faculties which others cannot gain without time-consuming training In short, he must gain the position in the medical community which other physicians will be forced to accept as essential. There are few areas in physical medicine which cannot be handled by technicians, as is proved by the ever-lessening contact between physical medicine specialists and the equipment in their departments, but in the field of diagnosis by physical methods there are several which, by their very nature of time consumption, tediousness, and interpretation, have more or less been willingly abandoned to him by his colleagues and not yet invaded by the technician By accepting and developing these gift horses the physical medicine specialist can and must gain the dependence of other physicians

I have personally witnessed, as I am sure many of you must have, the favorable change in the attitude of staff physicians, time after time at different hospitals and clinics when it became known that the physical medicine department could supply diagnostic information in terms of the third decimal place of chronaxie and the esoteric numbers of oscillometry and, when it was learned that the physician attended to the testing and evaluations himself, he was no longer regarded as a rubber stamp, but as a physician —a specialist.

I believe that for the present there are five major diagnostic procedures which all physical medicine specialists should pursue at their hospitals to the extent of available equipment. I have not mentioned to the extent of their time because they must either

make time for it or no longer consider themselves indispensable These five areas are electrothermometry, electrodiagnosis, including electric skin resistance, oscillometry, electromyography, and most important in the eyes of some, voluntary muscle evaluation

In the field of electrodiagnosis there have been innumerable attempts made to find newer ways of saying one simple thing Although it is true that the clinical test for nerve degeneration will give an immediate answer, in most cases, to the question concerning the physiologic and anatomic status of the nerve, as long as our fellow physicians are more impressed by an answer containing three or more significant figures, I believe we should take advantage of this weakness and, whenever possible, use the more refined methods of electrodiagnosis We must not have too much confusion within our own ranks, however, and for this reason it is with much joy that I witness the present trend of returning to the appreciation and use of chronaxie rather than the many ratios, strength-duration curves, and other recent formulae to which so much attention was paid during the last war

I believe that all physical medicine specialists should always be on the alert for the introduction of more methods of diagnosis which can best be performed in their departments and to which they can give personal attention, because, with the exception of electrosurgery and manipulation, there are almost no phases of physical therapy which cannot be learned in a shorter time than it takes to make a specialist

Herbert Kent, M.D, *Closing*—In reply to Dr Hansson's question as to the relative value of the various types of instruments available, it is my opinion that unless the instrument is accepted by the American Medical Council on Physical Medicine, it is dependent upon the individual who uses this procedure to see that the merits of the device are all that the manufacturer claims This particularly applies to those carrying on research In these cases, experiments should be carried out to establish the accuracy of the instrument

In closing, I wish to thank Dr Sidney Licht for his kindness in discussing my paper I also wish to thank Dr William Bierman, Mr H L. Gibson, Eastman Kodak Company, General Electric X-Ray Corporation, and U M A. Inc for their kindness and courtesy in supplying me with the instruments, photographs, and lantern slides

PROPAGANDA AT TAXPAYERS' EXPENSE

Mr Ewing's lengthy and elaborate booklet, *The Nation's Health—a 10-Year Program*, evidently has been mailed to many or all Rotary Club presidents in the United States at taxpayers' expense.

The booklet, which contains 186 pages and is considered more or less the "bible" for social planners in their fight for compulsory sickness insurance, was originally intended to be sold for $1 00 The last page carries this information "U S Government Printing Office, 1948, for sale by the Superintendent of Documents, U S Government Printing Office, Washington, D C , price $1 00 "

Here is what one Rotary Club president said in a letter to me after he received the booklet

"I haven't read it [the booklet] over, but in the preface Mr Ewing states he is depending on civic clubs such as ours to help pave the way It might be explained how the taxpayers' money is being spent in putting out such an elaborate treatise for political propaganda purposes."

If it is a fact that the Federal Security Administration mailed a $1 00 government publication to approximately 4,200 Rotary Club presidents in the United States, probably in addition to thousands of other civic club presidents, there is little wonder why a Congressional Committee recently began squawking about the money which the Federal government is spending for "sheer propaganda designed to influence public thinking and to bring pressure on Congress "

In its final report of the 80th Congress, the House Executive Subcommittee on Publicity and Propaganda said there is "considerable overstaffing in the press relations offices of a number of government agencies" and that many press relations employes are utilized by lobbyists "in furtherance of propaganda drives "

—Secretary's Letter, A M.A , January 31, 1949

REHABILITATION IN POLIOMYELITIS

KRISTIAN G HANSSON, M D , New York City

(From the Cornell University Medical College and Hospital for Special Surgery)

DURING the last eight years we have had much discussion on the early treatment of poliomyelitis, the percentage of recovery, and the mode of early treatment In studying the various reports the end results were very much the same with the different treatments, i e , 70 per cent recovered completely, 18 per cent showed slight residual paralysis, and 12 per cent severe paralysis It is this last group of patients with marked handicaps where rehabilitation plays an important part

Our interest in rehabilitation was much increased during the last war Although the word "rehabilitation" means to restore somebody to his former state, it has come to include all our efforts to overcome the damage to the human body wrought by trauma or illness The word convalescence is often used in civilian hospitals, and reconditioning is the term used in military hospitals

Although rehabilitation is usually associated with the convalescence, we must realize that rehabilitation really starts with the beginning of the acute onset The restoration to the maximum recovery is the guiding spirit of all our forts in the treatment of the polio patient

We will discuss polio rehabilitation under five eadings (1) treatment and prevention during ne acute stage, (2) bed rest, activity, and nution, (3) physical rehabilitation, (4) mental eadjustment, and (5) vocational training

Early Treatment

Everything we do for the acute poliomyelitis atient, be it position in bed to prevent contractures, application of heat to overcome spasm, r exercise to strengthen muscles, fits into the icture of rehabilitation We keep the patient n bed until it becomes safe for him to carry his veight The condition of joint stability and nuscle strength determines the time for weight bearing

In order to secure the best rehabilitation, the early treatment consists of

1 Maintenance of nutrition by proper diet including amino acids, testosterone, and estrogen
2 Instruction in proper body mechanics in bed
3 Early passive exercises to keep normal range of motion in joints and prevent contractures
4 Therapeutic measures for muscle spasm
   (*a*) Heat to muscles which show spasm
   (*b*) Individual tank with whirlpool and water of 100 F
   (*c*) Curare
5 Muscle re-education to secure the maximum return of muscle function.

The most difficult patients for rehabilitation are those patients who have spent several weeks in a respirator The position in the respirator produces persistent adduction contractures of the shoulders with cupping These patients also show marked asthenia It is to be hoped that the present respirator will be replaced by new types that will allow free movement of the extremities The following case report is of interest

Case 1 —An eighteen-year-old girl was taken sick the first week of December, 1946 She was taken to a hospital, where her appendix was removed When she returned home, she still had abdominal pain, and one day found she could not move her legs

She was told she had infantile paralysis and was removed to a hospital in Brooklyn, where she was treated with prone packs for three weeks She then was transferred to the Hospital for Special Surgery where she was placed on a hard bed with her feet against a foot board She was given packs, underwater treatments, and daily muscle stretching She was put on a diet to reduce

Later she was given a long leg brace for her right leg She has stood in a walker for short periods of time and is now learning balance on crutches and walks a short distance She went to the therapeutic pool every day, and the occupational therapists kept her busy whenever she was not scheduled for treatment

Bed Rest

The disadvantages of bed rest were much discussed in the recent World War Some very interesting investigations on bed rest were carried on at Cornell Medical College by Drs Dietrick, Whedon, and Shorr

In the study of normal individuals who were kept immobilized by plaster casts in bed, it was found that much calcium, phosphorus, and nitrogen were lost through the urine The same losses were found in polio patients who were bedridden for long periods One group of chronic patients and one group of acute cases were stud-

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Session on Physical Medicine May 19 1948.

make time for it or no longer consider themselves indispensable These five areas are electrothermometry, electrodiagnosis, including electric skin resistance, oscillometry, electromyography, and most important in the eyes of some, voluntary muscle evaluation

In the field of electrodiagnosis there have been innumerable attempts made to find newer ways of saying one simple thing Although it is true that the clinical test for nerve degeneration will give an immediate answer, in most cases, to the question concerning the physiologic and anatomic status of the nerve, as long as our fellow physicians are more impressed by an answer containing three or more significant figures, I believe we should take advantage of this weakness and, whenever possible, use the more refined methods of electrodiagnosis We must not have too much confusion within our own ranks, however, and for this reason it is with much joy that I witness the present trend of returning to the appreciation and use of chronaxie rather than the many ratios, strength-duration curves, and other recent formulae to which so much attention was paid during the last war

I believe that all physical medicine specialists should always be on the alert for the introduction of more methods of diagnosis which can best be performed in their departments and to which they can give personal attention, because, with the exception of electrosurgery and manipulation, there are almost no phases of physical therapy which cannot be learned in a shorter time than it takes to make a specialist

The handicapped polio patient has wo challenges First, the uncertainty ty in the early phase and later the i that he will not be perfectly normal

at difference between acute polio and e disease is the absence of pain in polio first three weeks The stay in the s not without some cheer In fact we etimes see well-meaning organizations spoil the children However, being n its family under institutional disci- kes the early phase of convalescence to the child patient as well as to the ent It is surprising how soon children emselves to being away from home and i companionship they enjoy with fellow

Only the occasional patient worries r the future as long as he is on active f some kind

he time comes to discontinue treatment atient is told no more improvement can ted, generally speaking, the ensuing lepression is difficult to handle. All pass through this period Some show iologic shock, others do not, but all feel ost cases the patient does not take "no" swer and shops around among several ntil it dawns on him that he has reached num improvement and must do his best it he has It is here that diversional onal therapy makes a great contribution t lead the patient's mind and interest obbies and occupations Where school- bleated, this should be encouraged To draw and paint has helped many pa- There should be a return to normal life ial intercourse with friends and visits heater or the movies or participation in creation and amusements. A typical escribed

—In August, 1945, a twenty-two-year-old became ill while on board an American transport, sailing for home after serving with the O S S in Italy She was sent to Walter Reed Hospital with both legs and trunk muscles paralyzed She was soon transferred to Warm Springs, Georgia, where she was given exercises and learned to walk with a right leg brace and two crutches

She moved to New York in November, 1946 She lives alone and drives her own car In an attempt to discard her brace she met with disaster when she fell and fractured her tibia She continued her muscle re-education and swimming in New York.

During the summer of 1947, she motored to Maine, driving alone She walks well with a long leg brace and Canadian crutches For the future she has various plans for vocation and mental relaxation She has attempted to write and illustrate short stories and also gets much pleasure from drawing and painting

Vocational Training

The ultimate goal in the rehabilitation of polio is to make the handicapped patient independent in his personal life, self-supporting in his family, and a useful citizen in the community The Federal government, the State, and the community are awake to these responsibilities and are organized to meet the demand of most of our patients At the Hospital for Special Surgery a representative of the Division of Handicapped of the State Education Department meets once a month with delegates from social service, occupational therapy, orthopedics, and physical medicine departments The applicants for vocational training are reviewed and discussed. A vocational aptitude test is given to the patient, and arrangements are made for training along lines suggested

I have personal experience with several badly handicapped girls, who are wheelchair patients They have been trained in shorthand and typing Such secretaries can be used in various hospital offices Even if they have to live in the hospital, they make up for their handicap in devoted service to the hospital They are not apt to leave on short notice or complain of salary every month They fill a real need in our hospitals and become self-supporting citizens and valuable members of the hospital staff

The occupational therapy department helps in the training of the vocational program. This makes it possible for the patient to start her vocational training while still undergoing treatment in the hospital Many correspondence courses are available

The weakness in our present program is a lack of real teachers available for instruction in useful occupations Such organizations as Goodwill Industries, Bulova, and the Institute for Crippled and Disabled do very praiseworthy work but require transportation for patients, and this often represents a difficult problem. A case report follows

ied These losses could be overcome by placing the patients on an oscillating bed for eight-hour periods It is believed that pressure on the soles of the feet intermittently will maintain normal blood chemistry

The disadvantages of bed rest in polio patients, often bedridden for years, are a phase that has been neglected until now The study of the blood chemistry gives us information on the metabolism of patients confined to bed It is not rare to see polio patients lose 20 to 30 pounds while maintaining the subcutaneous fat, and the actual loss is, therefore, in muscle tissue We supplement the polio patient's diet with amino acids However, this attempt at a polio diet has been rather crude With interests directed toward metabolism of polio patients, as is now going on at the Russell Sage Institute of Pathology, we can look forward to a better understanding of muscle metabolism We may hope to prevent loss of weight or to recover some weight by a proper diet or well-directed endocrine therapy

Case 2 —In July, 1945, a student nurse became seriously ill and was removed to a hospital for contagious disease She spent three weeks in a respirator and was given prostigmine injections to relax her muscles She was also given hot packs until her removal to another hospital in August, 1945

Treatments received there were hot packs, hot pool, and physical therapy Seven months later she started underwater walking and was also allowed a couple of hours a week in a wheel chair

In November, 1946, she was removed to New York Hospital to participate in experiments on bed rest Her weight at this time was 60 pounds She gained 20 pounds However, the endocrine therapy had to be discontinued because the patient developed a bass voice Other studies were made on the effect of polio on her metabolism, and she spent many days in an oscillating bed During this time her physical therapy treatments were continued, and she was fitted with two long leg braces In July, 1947, she was discharged to her home

In September, 1947, she was transferred to the Hospital for Special Surgery for rehabilitation Her treatment here consisted of exercises in the therapeutic pool She can now stand with the help of the walker and even take a few steps Since her acute illness she has had several severe attacks of abdominal pain This was diagnosed as a kidney stone in April, 1948, and the stone was removed One week following the operation she was able to get out of bed and sit in a wheel chair Her walking was resumed in another week

During the last year she has received instruction in shorthand and typewriting and is progressing fairly well in both of these subjects This knowledge will qualify her for a secretarial position

Physical Rehabilitation

The limited meaning of physical rehabilitation should begin when the maximum muscle strength has been recovered It has been shown by previous work that the useful recovery takes place during the first six months It is true that some improvement will continue for years, but this is rarely of functional value

It seems rational, therefore, to set the sixth month as the beginning of physical rehabilitation In the first six months the great emphasis is laid on rest in the proper position, the avoidance of strain on joints, ligaments, and muscles After six months we stress functional activity for practical purposes The patient is encouraged to help himself with his personal hygiene, to put on braces, get out of bed, and to get into and out of a chair In general, activities are stressed rather than rest The exercises are changed from muscle re-education exercises to maximum effort exercises

Mechanical supports are now recommended, such as abduction splint for paralyzed deltoid, high or low back braces for weak trunk muscles, long leg braces to prevent collapse of the knee, and supporting appliances for the ankle Everything is done to facilitate ambulation without doing harm to the patient Walking in the pool with braces, when necessary, is the first step in ambulation

Then comes the use of a walker and, later, balancing on crutches When the patient can balance himself on crutches, we start gait training and crutch walking Substitution movements may even be encouraged As an example, in paralyzed tibialis anticus we may train the patient to dorsal flex the ankle by using extensors of toes, while the toes are maintained in flexion

After two years of convalescence, orthopedic surgery should be considered, such as fusions to stabilize joints and thereby discard braces Tendon transplants are used for balancing of joint movement or to gain opposition of a thumb, epiphysidesis to equalize leg length, spine fusion, etc

In physical rehabilitation, physical therapy plays an important role Functional occupational therapy should be stressed more and plays a great part in convalescence of the polio patient The following case report is to be noted

Case 3 —In September, 1945, a twelve-year-old boy entered a hospital because he was ill He was told that he had infantile paralysis and spent six weeks in a respirator

He was transferred to the Hospital for Special Surgery on October 31, 1945 where he had daily packs and stretching exercise He also had many injections of curare followed by exercises to stretch his spastic muscles The following summer he was able to sit up in bed for fifteen minutes a day

He went home for the summer months and received treatments three times a week by a visiting physical therapist The following fall he was still

National Association has given approval to the Emerhard type of so-called portable respirator This apparatus will allow a greater freedom to the patient and permit active physical therapy and treatment during the acute, convalescent, and chronic stages of the disease.

I should like to take exception to one recommendation that is contained in Dr Hansson's paper I do not believe that special hospitals for the treatment of the acute, convalescent, or chronic poliomyelitis patients should be established In times of severe epidemic, such institutions are never adequate to care for the case load. In nonepidemic times we find many vacant beds, and these vacant beds represent a real financial liability to the community Rather than special institutions there should be created, within medical centers, institutions which provide a total rehabilitation program, not only for poliomyelitis, but for patients who are disabled by other infectious diseases as well as from industrial accidents

Dr Hansson has also spoken of diversional occupational therapy It is my considered opinion that diversional occupational therapy may also be functional and that the occupational therapist has a real place in this total program of rehabilitation

In conclusion, I should like to point out that the major problem confronting the medical profession today is seeing to it that disabled individuals, whatever the cause, are given the greatest opportunity possible for rehabilitation and preparation for their making full use of the capabilities that remain with them and that they be contributing rather than consuming members of society

---

PRESENT-DAY EDUCATION IN PHYSICAL MEDICINE

WILLIAM BIERMAN, M D , New York City

(From the Department of Physical Therapy, Mount Sinai Hospital)

THE subject of physical medicine is of interest to the general practitioner and to the practitioners of many of the medical specialties, as well as to the doctor who makes this his exclusive professional concern. In order to gain an overall view of the subject let us first consider the position of the specialist in physical medicine

The Specialist in Physical Medicine

About one year ago, physical medicine was officially recognized as a specialty with a board of its own. And well it might be, for the practice of physical medicine as it exists today requires special knowledge and special skills, as well as a large amount of space and a costly collection of apparatus. Subdivisions of this specialty include thermal therapy, hydrotherapy, climate and spa therapy, electrotherapy, ultraviolet radiation, massage, kinesiology, exercise and rehabilitative therapy, occupational therapy, manipulation, and specialized diagnostic procedures. On the European continent, this specialty also includes the use of x-ray and radium radiation. To this there is now being added the field of radioactive isotopes Numerous books have been written concerning each of these subdivisions. The necessity for such a large literature becomes understandable when one reviews any one of these subdivisions in some detail, as, for example, thermal therapy This subject covers conductive heating measures such as hot and cold compresses, heating pads, lamps (producing both visible and infrared radiation), diathermy (long and short wave), electrosurgery, and fever therapy A knowledge of the physical, physiologic, and chemical background and the scientific application of these thermal measures, as well as skill in their use, requires an extensive period of education and training Many of the other subdivisions are even more complicated. To compound further the complications of the medical practitioner who specializes in this field is the necessity for reliance upon technicians, each specially trained in one of several fields This reliance on skilled technicians is a matter of practical expediency, no matter how thoroughly versed in his specialty and how skillful the specialist himself may be

The candidate for certification by the American Board of Physical Medicine is required to possess certain qualifications These include general ones, such as the possession of good moral and ethical standing in the profession, and membership in the American Medical Association Professional ones consist of graduation from a recognized medical school and the completion of an internship, preferably of the general rotating type, and special training which must include a period of study after the internship of not less than three years in clinics, dispensaries, hospitals, or laboratories recognized as competent to provide satisfactory training in physical medicine.

This period of specialized preparation must include (1) graduate training in anatomy (including kinesiology and functional anatomy), physics (including radiation physics, electronics, and medical instrumentation), physiology, pathology,

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, Session on Physical Medicine, May 19 1948.

Case 5 —A six-year-old girl contracted poliomyelitis in 1927 while living in Pittsburgh, Pennsylvania She was left with paralysis of both legs, right arm, and back She spent five years in a convalescent home undergoing rehabilitation

When she left Pennsylvania in 1932, she was wearing long leg braces attached to a Knight spinal brace with hip and knee locks Thus harnessed she was able to walk to a limited degree with the help of crutches, however, she spent most of her time sitting in a wheel chair This led to hip flexion contracture and she was admitted to the Hospital for Special Surgery, where she had her first Soutters operation

She returned home and attended high school In June, 1937, she had her second bilateral Soutters operation She was then able to complete high school and entered a business school, with the help of the State Rehabilitation Division

By July, 1941, a curvature of the spine had become progressively worse, and she had her first spinal fusion in July, 1941 In 1943 the scoliosis increased in spite of the fusion, and pseudoarthrosis was diagnosed A second spine fusion was done in April, 1943, which was followed by an infection and osteomyelitis

In 1944 she had her first job working in the accounting office of the Hospital for Special Surgery After three months she was admitted to the hospital for penicillin therapy for osteomyelitis In October, 1945, she sustained a fracture of the right tibia which was treated with closed reduction and plaster

In September, 1946, she had her third spinal fusion and her third Soutter operation, both of which were very successful On Christmas Eve, 1947, she fell and sustained an intertrochanteric fracture of the right femur which was plated She is now perfectly well The fusion of the spine is solid and the fractures are well healed However, she spends most of her time in a chair She is able to take care of herself and has given up walking, but is able to hold a permanent position as medical secretary in the hospital, where she lives in the nurses' quarters

Summary

1 The rehabilitation in polio really starts in the acute stage in the form of prevention of deformity

2 Bed rest versus activity and nutritional requirement must be determined for each individual patient

3 Physical restoration to strengthen and coordinate muscles, to support joints by braces or orthopedic operations, and to retrain the patient in a new functional activity has received additional emphasis since the war

4 Mental readjustment should not be neglected in a disease that can strike the healthiest individual and make a wheelchair patient out of him in a very short time.

5 Vocational training is the responsibility of the community, the State, and the Federal government and is also recommended to make the handicapped patient independent and a citizen.

Conclusion

It is our duty to rehabilitate the polio p after the acute illness We have not e hospitals equipped for this work. We special hospitals for convalescent polio pat especially for adolescent and adult patients polio patients in New York are well care thanks to the support of the National Found for Infantile Paralysis It is only to be hope New York will soon have adequate convale hospitals for all polio patients, including a

Discussion

Hart E Van Riper, M D , *New York (B vitation)* —A review of crippled children's reg as maintained by Services for Crippled Childr all of the 48 states indicates that poliomyelitis the leading cause of disablement among chi The Statistical Bulletin of the Metropolitan Li surance Company also points out that poliomy continues to cause an ever-increasing numb persons who are disabled in one way or an One who sees the end results of poliomyelitis demics cannot fail to agree with Dr Hansson early rehabilitation is important in the treatme this disease

All too frequently, children are admitted to pitals, given adequate early care and treatment are then discharged not prepared to utilize to th their mental as well as their physical resources my own feeling that rehabilitation, that is me rehabilitation, should begin with the day the pa is admitted to the hospital It is not sufficie provide treatment over weeks or months and institute rehabilitative measures Even the during early convalescence, especially the y adult, can, through proper planning, be fitted t with the handicaps that have resulted from disease

It is essential that someone take the lead i ordinating the many professional abilities tha brought to bear on the patient It is quite lo that the doctor of physical medicine is the one qualified to coordinate and correlate the activiti the many members of the professional team T should include the physician who is directly sponsible for the care of the patient, either the ternist or pediatrician and the orthopedist, the do of physical medicine, the occupational therapist, physical therapist, the nurse, the psychologist, vocational counselor, the teacher, and others have direct contact with the patient

One cannot help but note Dr Hansson's critic of the presently available respirator The large t type of respirator unquestionably prevents pro physical therapy to the patient, and the confinem within this apparatus does result in certain disab ties and deformities that could otherwise have b prevented I have but recently learned that Council on Physical Medicine of the Americ

Medical Undergraduate

A recent survey indicates the extent of the ... teaching in this subject [2] The great ... of medical colleges in this country in... instruction in physical medicine as a ... part of the curriculum One third of these schools have separate departments of physical medicine In only 10 per cent of the ... does the doctor in charge hold professorial ... The subject is usually presented in the third and/or fourth year The number of hours devoted to it varies from one to one hundred twenty—with an average of sixteen The attention devoted to physical medicine has increased, but the undergraduate still secures only a superficial acquaintance with it

The Physical Therapist

The term "physical therapist" is now applied to the technician in this field Formerly it was employed to designate the physician-specialist who is now called a "physiatrist" In New York State there are a number of lay workers who are licensed as physical therapists

There are twenty-five schools for the teaching of technicians in physical medicine that are acceptable to the Council on Medical Education and Hospitals of the American Medical Association.[1] Candidates for admission to these schools are required to satisfy one of the following requirements

1. Graduation from an accredited school of nursing
2. Graduation from an accredited school of physical education
3. Two years of approved college training including satisfactory courses in biology and other sciences.

The minimum length of time for the course is thirty-six weeks Actually it varies from twelve to fifty four months Graduates receive certificates, diplomas, or degrees A minimum of twelve hundred hours of instruction in specialized subjects which include the applied sciences (anatomy, pathology, physiology, psychology, and physics), procedures, such as electrotherapy, radiation therapy, hydrotherapy, massage, and therapeutic exercise, physical therapy as applied to medicine, neurology, orthopedics, and surgery, ethics and administration, and electives such as bandaging and first aid The last four hundred hours must be devoted to clinical practice The total maximum enrollment in the approved schools is limited to 419

Many who desire to become physical therapists do not go to approved schools because they do not know of their existence, or cannot meet their entrance requirements, or because they are excluded due to the limited capacity of these schools It is not strange, therefore, that many technicians who enter the field are poorly trained

Graduates from approved schools can become members of the American Registry of Physical Therapy Technicians after they have passed an examination given by the registry Although the registry is not authorized by any national or state agency, it is considered as a national qualifying organization today However, due to the limited number of its members it is not yet practical to demand that all technicians be registered before they are permitted to work as physical therapists All registered technicians are required to observe the code of ethics, namely, that they shall practice only under the direction of a licensed physician in accord with his prescription, and that under no circumstance will they treat patients on their own initiative or operate an independent office

The Occupational Therapist

The Council on Medical Education and Hospitals of the American Medical Association has approved 18 schools in this country and in Canada for the teaching of occupational therapy [3] In 1946 these schools graduated a total of 391 students The duration of the courses varies from two to five years Graduates of the longer courses are given Bachelor of Science degrees The shorter courses are designed for those who have had one or two years of college education before admission. The standards for these schools are set by the Council on Medical Education and Hospitals in cooperation with the American Occupational Therapy Association. The latter organization also registers qualified therapists

The curriculum of approved schools requires not less than sixty semester hours devoted to theoretic technical training The didactic instruction includes the biologic sciences of anatomy, kinesiology, neurology, physiology, and psychology, the social sciences of sociology, individual readjustments, social and educational agencies, the theory of occupational therapy with interpretative courses covering the principles and practice of occupational therapy in relation to orthopedics, pediatrics, tuberculosis, psychiatry, general medicine, surgery, and other special fields, and the clinical subjects of blindness and deafness, cardiac diseases, general medical and surgical conditions The major portion of the thirty semester hours devoted to technical training may be in one of three fields with survey courses in the other fields. They are (1) fine and applied arts (design, leather,

and other basic sciences which are necessary to the proper understanding of physical medicine, (2) an active experience of not less than two years in hospital clinics, dispensaries, and diagnostic laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association and the American Board of Physical Medicine Such specialized training is available in residencies and fellowships There are 70 assistant residencies and residencies in physical medicine available in 34 hospitals [1] An additional period of not less than two years of study and/or practice in physical medicine is also required

The specialist in physical medicine can secure his graduate education in a number of universities in the United States No one of these covers all the specialized knowledge now available in this field The logical development would be the establishment of at least one center where the would-be specialist could secure all phases of the knowledge he now must seek in different places throughout the land More thoroughly representative didactic as well as clinical teaching, including a knowledge of the technics required of technicians, should be available to him He should, for example, become capable of performing tests for muscle function, of administering corrective and rehabilitative exercises, and of giving a good massage It is very important that he become a master of the art and science of manipulation as well as of the many other special technical practices which have been developed in physical medicine Possibly a period of two years would be necessary for this period of special training

Such a curriculum would necessitate a full- and part-time staff, the members of which should be selected on the basis of their knowledge, experience, ability to teach and to conduct research, and their sense of logical values resulting from a thorough understanding of the specialty This last qualification is most important at the present time, inasmuch as the fundamentals of teaching are yet to be established With such a group, the danger of emphasizing unduly any one phase of the specialty would be minimized Reconditioning of individuals disabled by trauma or disease has become an important part of physical medicine The number of such individuals is large, but unquestionably the number of ill persons who can be benefited by other forms of physical medicine is many times larger The necessary staff could be supported only by a generous fund for this purpose These monies, although large in sum, would be spent more advantageously than the greater amount represented by the aggregate of smaller sums divided among numerous institutions

An important question involved in the training of the specialist in physical medicine is "training for what" The career of the specialist in physical medicine, when contrasted with specialization in other phases of medicine, possesses advantages and disadvantages The advantages include soul-satisfying activity for those who are fundamentally attracted to this field, relative regularity of hours of working and minimization of the tension to which many doctors are subjected, and opportunity for original investigation for those who are both mechanically and physiologically minded The disadvantages include a lack of appreciation of the importance of the field on the part of other practitioners, and a restricted financial return for his efforts Unlike specialists in other subdivisions of medicine such as internal medicine, surgery, ophthalmology, etc , there are relatively few specialists of physical medicine in this country who rely primarily upon the financial return secured from private practice To develop the reasons for this would take us too far afield The establishment of full-time salaried positions in the Veterans Administration has increased the number of opportunities for earning a modest livelihood in this field A high degree of socialization now exists in this division of medicine. The young man entering into it, therefore, should realize that the horizon of his financial prospects includes essentially only the modest returns from a salaried position

The General Practitioner and Specialist in Fields Other Than Physical Medicine

A knowledge of physical medicine is of advantage in the diagnosis and treatment of so many conditions encountered by the general practitioner and by the specialist that the need for conveying information concerning these measures to these individuals has been recognized for a long time To meet this need, single lectures and series of lectures have been given at medical societies, seminars have been held, and short part-time courses of instruction have been given None of these are satisfactory The part-time courses offer the practitioner his best opportunity for acquiring some of the knowledge he needs Certainly it is superior to the postgraduate teaching he now receives at the hands of the manufacturer's representative who sells him a short wave machine or some other equipment Such a course permits him to realize that physical medicine is a complex specialty As more time is found for instruction in physical medicine in the undergraduate curricula of medical schools, the need for the present technic for the education of the general practitioner will be minimized Unfortunately, the general practitioner's ignorance of this field is in a large measure responsible for the unsatisfactory treatment of his patients,

improvement in the teaching of the specialist, the general practitioner, and the technician engaged in this field.

Discussion

Richard Kovacs, M.D., *New York City*—Dr Burman has given a comprehensive picture of the present-day status of education in the new field of physical medicine His emphasis on the education of specialists is in keeping with the recent progress during this phase of the subject Even as recently as five years ago, only the most sanguine could hope for the creation of an independent board, which has now become a reality, and for the possibility of such training as is now requested and available However, I fully agree with the essayist about the fact that most of the younger men qualifying as specialists will have to find their mainstay in institutional practice.

Education of general practitioners in physical medicine is of paramount importance if patients are to receive the benefit of available physical therapy measures at an early time. On this phase of the subject, as well as on the education of technicians there is much to be said on the situation prevailing in our own State.

The Medical Society of the State of New York has endeavored for many years to supplant the deficient education of general practitioners in physical medicine by offering postgraduate lectures on the subject to all county societies As chairman of a special committee on physical therapy from 1932 to 1935, I have presented the subject before most of the 61 county societies. Furthermore, through the Committee on Public Health and Medical Education, there have been available for the past fifteen years two courses on physical therapy of four lectures each, free of charge to any county society By this time all of the medical schools in this State have established some undergraduate training in physical medicine. Postgraduate training has been regularly scheduled since 1927 for general practitioners as well as for specialists at the New York Polyclinic Medical School and Hospital, and is also being offered at irregular intervals by Columbia University and its affiliates, as well as recently by the new Rehabilitation Center at Bellevue Hospital.

The status of the education of technicians, which has been so well organized on a national scale, is in a state of utter confusion in New York State This is chiefly due to the fact that misdirected legislation has inserted a so-called physiotherapy "clause" in the Medical Practice Act of 1926, and the story and results of this action are now unfortunately well spread on the record Physiotherapists were to be licensed on a basis of a topsy-turvy set of educational requirements, involving four years of study in an accepted institution This seemed acceptable on first sight, but the catch came in a waiver clause, admitting, without examination all persons having "practiced" physical therapy at that time The result up to this time was the admittance within these years of some 350 people without examination and some 50 since by examination also the expenditure to resist the efforts of registered physiotherapi be freed even from the nominal supervisic practice in their own offices under medical s vision As a further result of the unsatisfa State law, while the education of technicians national standards was carried on satisfactor teaching institutions of this State, the gradua these institutions and those recognized by American Registry of Physical Therapy Techni have no legal status in this State, and unde strict interpretation of the existing statute, p cians employing them could be prosecuted T to the confusion, massage operators have licensed for many years in New York City, a order to be able to fill vacancies in municipal pitals, technicians are appointed to these un separate set of civil service regulations The re tion of this highly unsatisfactory state of affai legislation has been considered during the past by a joint Council committee of the Medical So of the State, and the recommendations made ar to be acted upon by the Council of the State So

There can be no question but that the educ and licensing of physical therapy technicians in York State presents an involved problem, an fair solution is highly desirable It may re even some modification in national standard asmuch as there seems to be a definite place fo recognition of "subprofessional" groups, suc masseurs and junior technicians, for social economic reasons

The inclusion of occupational therapy in broadened field of physical medicine has been desirable, the educational requirements fo technicians and the scope of their activity hav well established by this time This cannot be s the other group of new technicians, the phy education or "corrective" therapists Their developed under wartime conditions, dealt c with relatively healthy and young persons, as i continued in veterans hospitals and civilian ins tions, it brought on overlapping with work do physical and occupational therapists and also the "corrective" therapists to some disadvantag cause of deficient training along the lines o thology and because of their comparative lack perience in dealing with the sick Dr Bier pointed out correctly that a more unified tra program for these three technician branches sh be considered In the meantime it is desirable the present corrective physical rehabilitation sonnel should be given the opportunity to repl their training, while physical therapists shoul ceive additional training and experience in corre physical therapy Thus, the inevitable unificati these two cognate branches may gradually achieved

metal, plastics, textile and wood), (2) special and adult education (home economics and library science), and (3) recreation (music, dramatics, social activities, gardening, and physical education) Not less than thirty-six weeks must be devoted to clinical training Of these not less than four weeks each must be spent in tuberculosis sanatoria or services, general hospitals, children's hospitals or services, and orthopedic hospitals or services, and not less than eight weeks in mental hospitals [3]

The Physical Education Therapist

During World War II, many graduates of schools of physical education became important members of the team working for the physical reconditioning of the disabled They are continuing in the same capacity in rehabilitation departments of veterans and civilian hospitals. Formerly, these individuals had acted only as teachers of physical education. The curricula of the schools from which they graduated were designed for this purpose Now that they have assumed the additional role as technicians in reconditioning and rehabilitation, it is obvious that their course of study should be redesigned A course suggested for this purpose includes the following

- Basic sciences minimum of twenty-six semester hours
  - Minimum
    - Biology (or equivalent)
    - Anatomy and kinesiology
    - Physiology and physiology of exercise
  - Desirable
    - Chemistry
    - Psychology
    - Hygiene
      - Personal hygiene
      - Mental hygiene (or equivalent)
- Technical training of physical education
  - Undergraduate major in physical education (Minimum thirty-six semester hours)
- Methods courses and practice teaching experience[4]

The need for the establishment of standards comparable to those required of physical therapists and occupational therapists is obviously a definite one

A review of the curricula required and suggested for the physical therapist, the occupational therapist, and the physical education therapist shows that all three must spend a considerable percentage of their time in learning the same subjects, such as anatomy, physiology, kinesiology, psychology, and hygiene The possibility of training one individual in all three of these technical branches should be considered A technician so educated would be better able to comprehend the advisability of applying technic rather than another in the treatmen given patient She could also be of servi smaller institutions unable to afford se technicians A curriculum covering a peri four years could act as a basic one A grac could then specialize further in that divisi which she desires to become more proficient four-year course such as that indicated, be of its technical nature, may prove attracti many high school graduates who desire to (into some phase of medicine and are not attra to the field of nursing

There are objections to this plan for the t ing of the physical therapist It is dou whether, in view of the present educational cept of the necessity for the incorporation o called "cultural subjects" in courses leading degree, any university would issue one to a dent who devoted her time to the acquirin knowledge which would be considered as ali exclusively vocational One could enter academic arguments as to whether a person has acquired a fair background in such subj as human anatomy and physiology presente her in good written and spoken English is nc well educated as one who has devoted the s amount of time to other forms of litera written in English and in foreign languages

It is necessary to be factual The professi life span of the average young woman—ter nated as it frequently is by marriage, or the ne sity for taking care of a home—is a short (Within the few years available to her, she n learn what has now become a relatively comp profession and then engage in its practice I not better to give her a thorough training for specialized activities rather than insist that devote time to learning a smattering of sc *foreign language—which she promptly proce to forget Is she necessarily restrained from* perusal of classical literature because such re ing is not a curricular requirement?

A basic educational requirement such as one suggested would allow a single equable exa mination for all who desire to become register Special arrangements for education and registration will have to be made for the gradu nurse and for the graduate in physical educati *who desires to enter this field* [5]

Conclusion

Physical medicine is a medical specialty growing importance There is particular ne for conveying information on this subject to t general practitioner The specialty itself, ho ever, is far too complicated to be learned in a but a long and comprehensive course of instru tion and practice There is room for considerat

improvement in the teaching of the specialist, the general practitioner, and the technician engaged in this field

Discussion

Richard Kovacs, M.D., *New York City*—Dr Bierman has given a comprehensive picture of the present-day status of education in the new field of physical medicine His emphasis on the education of specialists is in keeping with the recent progress along this phase of the subject Even as recently as five years ago, only the most sanguine could hope for the creation of an independent board, which has now become a reality, and for the possibility of such training as is now requested and available However, I fully agree with the essayist about the fact that most of the younger men qualifying as specialists will have to find their mainstay in institutional practice

Education of general practitioners in physical medicine is of paramount importance if patients are to receive the benefit of available physical therapy measures at an early time On this phase of the subject, as well as on the education of technicians, there is much to be said on the situation prevailing in our own State

The Medical Society of the State of New York has endeavored for many years to supplant the deficient education of general practitioners in physical medicine by offering postgraduate lectures on the subject to all county societies As chairman of a special committee on physical therapy from 1932 to 1935, I have presented the subject before most of the 61 county societies Furthermore, through the Committee on Public Health and Medical Education, there have been available for the past fifteen years two courses on physical therapy of four lectures each, free of charge to any county society By this time all of the medical schools in this State have established some undergraduate training in physical medicine Postgraduate training has been regularly scheduled since 1927 for general practitioners as well as for specialists at the New York Polyclinic Medical School and Hospital, and is also being offered at irregular intervals by Columbia University and its affiliates, as well as recently by the new Rehabilitation Center at Bellevue Hospital.

The status of the education of technicians, which has been so well organized on a national scale, is in a state of utter confusion in New York State This is chiefly due to the fact that misdirected legislation has inserted a so-called physiotherapy "clause" in the Medical Practice Act of 1926, and the story and results of this action are now unfortunately well spread on the record Physiotherapists were to be licensed on a basis of a topsy-turvy set of educational requirements, involving four years of study in an accepted institution. This seemed acceptable on first sight, but the catch came in a waiver clause, admitting, without examination, all persons having "practiced" physical therapy at that time The result up to this time was the admittance within these years of some 350 people without examination and some 50 since by examination, also the expenditure of much energy on the part of the medical profession to resist the efforts of registered physiotherapists to be freed even from the nominal supervision to practice in their own offices under medical supervision As a further result of the unsatisfactory State law, while the education of technicians under national standards was carried on satisfactorily in teaching institutions of this State, the graduates of these institutions and those recognized by the American Registry of Physical Therapy Technicians have no *legal status in this State*, and under the strict interpretation of the existing statute, physicians employing them could be prosecuted To add to the confusion, massage operators have been licensed for many years in New York City, and in order to be able to fill vacancies in municipal hospitals, technicians are appointed to these under a separate set of civil service regulations The resolution of this highly unsatisfactory state of affairs by legislation has been considered during the past year by a joint Council committee of the Medical Society of the State, and the recommendations made are still to be acted upon by the Council of the State Society

There can be no question but that the education and licensing of physical therapy technicians in New York State presents an involved problem, and its fair solution is highly desirable It may require even some modification in national standards, inasmuch as there seems to be a definite place for the recognition of "subprofessional" groups, such as masseurs and junior technicians, for social and economic reasons

The inclusion of occupational therapy in the broadened field of physical medicine has been most desirable, the educational requirements for its technicians and the scope of their activity have been well established by this time This cannot be said of the other group of new technicians, *the physical* education or "corrective" therapists Their work, developed under wartime conditions, dealt chiefly with relatively healthy and young persons, as it was continued in veterans hospitals and civilian institutions, it brought on overlapping with work done by physical and occupational therapists and also put the "corrective" therapists to some disadvantage because of deficient training along the lines of pathology and because of their comparative lack of experience in dealing with the sick Dr Bierman pointed out correctly that a more unified training program for these three technician branches should be considered. In the meantime it is desirable that the present corrective physical rehabilitation personnel should be given the opportunity to replenish their training, while physical therapists should receive additional training and experience in corrective physical therapy Thus, the inevitable unification of these two cognate branches may gradually be achieved

FIVE YEARS IN THE PRACTICE OF A NINETEENTH CENTURY NEW YORK PHYSICIAN—DR WILLIAM H VAN BUREN

GEORGE ROSEN, M D , New York City

(From the Department of Health, New York City)

AS A field of investigation, the economic history of American medicine is still largely untilled In 1946, the author offered a preliminary collection of materials toward the eventual preparation of such a history [1] This comprised a group of fee bills issued in the United States between 1816 and 1891 It is obvious, however, that price data contained in such fee schedules cannot be accepted uncritically Severe competition and difficulties of collection often rendered ineffectual efforts to stabilize medical prices In numerous instances, published fees represented an ideal rather than actuality

Obviously, such tentative interpretations regarding the significance of changing levels of medical prices as may be drawn from published fee schedules must be checked against data derived from other sources Account books kept by physicians or patients provide another important source of information on medical prices Furthermore, by making it possible to trace within a given area or period the price levels that actually prevailed, such books provide a check on the extent to which fee schedules reflected reality For this reason, a study of account books has been undertaken

This paper is concerned with an analysis of one of these, a book kept by William H. Van Buren of New York from October, 1844, to August, 1849 This account book, maintained over a period of almost five years, gives a lively picture of the practice of a New York physician in the middle of the nineteenth century, and throws an interesting light on medical education at the time

The Doctor

William H Van Buren, whose account book we shall presently examine, was born April 4, 1819, at Philadelphia, the son of Abraham Van Beuren, a merchant * He entered Yale College in 1838, but because of some student prank was compelled to leave in his junior year Thereupon he enrolled at the Medical School of the University of Pennsylvania, where in 1840 he received the M D degree

After graduation, Van Buren entered the United States Army as an assistant surgeon While in military service, he was marriec November 8, 1842, to Louisa D Mott, daug of the surgeon, Valentine Mott After ha served in Florida and on the Canadian fron Van Buren resigned his commission in 1844 settled in New York City to practice The count book covers the five years following opening of Van Buren's office, and is thu particular interest since it enables us to trace developing practice of a young doctor

Soon after coming to New York, Van Bi became a member of the surgical staff of Belle Hospital From 1852 to 1866, he was profe of anatomy at Bellevue Hospital Medical lege, and from 1866 to 1883, he occupied the of professor of surgery in the same institut Van Buren was visiting surgeon to the New Y Hospital from 1852 to 1865, and in 1876 made president of its medical board He also consulting physician to various hospit among them Bellevue, Presbyterian, and Woman's Hospital In 1859, he was vice-pr dent of the New York Academy of Medic Van Buren's later career was devoted enti to consultation practice and teaching He p lished several books, among them *Contributi to Practical Surgery* in 1865, *Lectures on Disei of the Rectum*, 1870, and, in 1874, with Edw L Keyes, *A Practical Treatise on the Surg Diseases of the Genito-Urinary Organs, inclua Syphilis* He died on March 25, 1883

The Account Book

The Van Buren Account Book is a volume 86 pages, $5^{3}/_{4}$ by 8 inches in size ** It is bou in brown leather, somewhat scuffed Pasted the flyleaf is a printed fee schedule entitled List of Medical and Surgical Charges Establisl by the Associated Physicians and Surgeons of City of New York, December, 1815, and appro by the New York County Medical Socie January 2, 1816" Actually, this list of f dates back to 1790, when it was adopted by doctors of New York. Reissued in terms American currency in 1798, it was again appro by the New York County Medical Society January 2, 1816 [1] Dr Van Buren undoubtec used this list as a guide in charging his patien and it is worth noting that after fifty years it w

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, Session on History of Medicine, May 20 1948

* W H. Van Buren dropped the e from the paternal Van Beuren.

** The Van Buren Account Book is in the possession of Library of the New York Academy of Medicine New Y City

apparently still sufficiently in accord with other prevailing prices to be used by a young physician entering practice

Two pages following the fee schedule contain a few sporadic notations about patients We learn that Mrs Fanning, 25 Thomson Street, expected "to be confined in July", and that Lydia Swann, a "staphyloraphy case—lives 520 Greenwich at Mrs Coombs" Such entries arouse our curiosity Did Mrs Fanning have a boy or a girl? How did the staphylorrhapy turn out? But, as no answer is provided, we turn the page and come upon a list of "Monthly Nurses" The names and addresses are given of five women who could be called upon when nursing care for an extended period was required

Dr Van Buren's first entry is dated October 3, 1844, and the last August 29, 1849 Thus, the entries cover a period of four years and eleven months In general, the record is continuous There are a few gaps, however, in 1845, but it is not clear whether these are due to a lack of anything to record, or to some other reasons. Following the last page of entries is a list of "Students names and date of Entry in Office with Amount of fee charged and amount received" This list covers the period from 1846 to 1849, and records information for eight students Finally, the last three pages of the book contain a recapitulation of Dr Van Buren's income from his practice by months and years This section also indicates how much came from student fees, how much was taken in cash, and how much was carried on credit

The Students

Medical education in the United States has passed through several distinct phases since colonial days The first phase of its development consisted essentially of a period of apprenticeship, during which the aspiring young man studied with a chosen medical practitioner for some years Later, medical schools were established At the same time, however, the preceptorial system remained in existence Throughout a good part of the nineteenth century the two systems were combined Edward L. Trudeau relates, in his *Autobiography*, that, in 1865, when he began the study of medicine, in addition to attendance at formal lectures in medical school, "the law required that every student enter his name with some reputable practising physician for three years as a student in his office for which he paid the physician one hundred dollars each year"[2] Some practitioners, especially if prominent professionally, had more students than they wished In such instances, students were turned over to a younger colleague Van Buren recorded several students referred to him by Valentine Mott, his father-in-law The entries are as follows

Sylvester Van Sykel—Dr Mott's Of Sept. 1847
Recd. $125 00 on his a/c Sept 30, 1847
H K.W Flynn—Octr 1847—Dr Mott's fee $300 00
Recd on his a/c Oct 18th 1847 $50 00
Recd on his a/c Jan 27, 1848 $50 00
Recd on his a/c Mch 20th 1849 $12 50

From Dr Van Buren's entries it is clear that student fees provided half his cash income during the second year in practice, and almost the same was true during the third year Thereafter, however, the proportion of income derived from practice increased progressively

The Practice

During his first month in practice, Dr Van Buren recorded some of his expenses Later he stopped entering these items, but, few as they are, they provide a glimpse of the doctor's household economics On October 5, 1844, he paid Captain Knapp of the schooner *Columbia* a freight charge of $34 90 Two entries of the same date indicate payments of $16 50 for house expenses, and $10 50 to B F Rittenhouse for wood On October 9, there was a payment of $9 25 for wood and oats to P Fenwick, but on the same day the doctor recorded that he had discounted a note of $100 On October 16, Van Buren recorded payments of $7 75 for boots, of $3 for ale, $1 00 for horseshoeing, and to Martha, a domestic, $16 00 for the period from September 8 to October 8 As of the same date, he also entered 70 cents for the London *Lancet*, and $1 00 for hack hire An entry of October 25 recorded the discounting of a note at four months with the Bank of the Metropolis, Van Buren receiving $375 This was expended within the next two weeks for further necessities On October 26, the doctor paid $100 to B F Mosly for a horse, and, on October 31, $8 00 to a saddler On November 4, he spent $25 83 for furniture, and on November 8 he paid $250 to Lieutenant Walsh, U S N, for house rent With this item entries of expenditures cease, but the basic pattern of professional expenses at this period is clearly revealed

While Van Buren did not enter the diagnosis for every patient he saw, there are a sufficient number of such items to indicate the nature of his practice In addition to simple home and office visits, he noted a variety of medical and surgical conditions Among these are sciatica, hemoptysis, spermatorrhea, strumous ophthalmia inflammation of the mamma, phthisis, caries of the spine, dysmenorrhea, inflammation of the eyes, gonorrhea, syphilis, hydrocele fistula in ano, phymosis, nasal polyp, vesical calculus, urethral

stricture, dropsy, steatomatous tumor of the head, and pregnancy.

What did the doctor do for his patients? Besides examining and giving his opinion, various therapeutic measures were utilized These included vaccination, acupuncture, the use of the cautery and the seton, paracentesis, and such operations as tracheotomy, amputation of an arm, ligature of a carotid artery, setting a fracture, plugging the nares, lithotomy, removal of a nasal polyp, tapping of a hydrocele, operation for phymosis, opening of an abscess, and operation for fistula in ano A case of sciatica was treated with a seton For gonorrheal stricture, the bougie was employed In addition, Van Buren attended a fair number of obstetric patients

One of the obstetric entries is rather curious On July 22, 1847, Van Buren recorded a visit to "Mr Kennedy's daughter (Cott's mistress)," and on August 20, one visit to "Cott's Mistress" An entry of October 1, 1847, states "Cott's mistress (Anna Kennedy) Accouchment," and another of January 12, 1848, tells us that Samuel Cott, 94 Green Street, had two children vaccinated Cott and his "mistress" remained faithful patients, for a number of entries relate to them On June 14, 1849, "Cott's Mistress" was again delivered, and was seen by Dr Van Buren every day for the next four days One's curiosity is aroused by these entries, but the doctor's daybook retains its secrets

Another series of entries records the trials and tribulations of a Captain Charles, apparently a naval gentleman, who had become too intimate with the gonococcus After having been treated for stricture over a period of months, on April 4 the unfortunate captain is again noted as having gonorrhea

Patients suffering from venereal disease are often entered without a name, or in some oblique fashion For example, one finds this

June 24, 1848 Casey's friend gonorrhea 2 t Of $2
July 3, 1848 Boy, gonorrhea $1 Young man, chancres $2

Van Buren's increasing surgical activity is evident over the five-year period As time went on, he performed more major operations In a number of instances, he assisted at operations One case that he noted was apparently an industrial accident It is entered as

October 23, 1848 Harlem R.R Co Amputation of Arm at Harlem

What did Dr Van Buren charge for his services? These charges follow closely the fee schedule adopted in 1816 by the New York County Medical Society Although no conclusions can be drawn from a single instance, the evidence of the Van Buren account book suggests that published fee lists may not have deviated too much from actual charges The fee for an office visit was $1 00 to $2 00 A home visit to the patient was $1 00 to $2 00, usually $2 00 At the beginning of his practice, Dr Van Buren attended the nuns at a convent He charged $1 00 for each visit that he made, but, on October 13, 1844, he entered a charge of $5 00 for an examination and opinion in the case of Sister Seraphine However, on October 28, the doctor paid another visit to the convent, leaving prescriptions for six sisters The fee was $3 00 for all six In another instance, an examination of the chest with an opinion was charged at $3 00 The fee for services at night was $10 00 A separate charge was made for the use of a speculum, this charge was priced at $2 00 Minor surgery varied in price from $2 00 to $5 00 Acupuncture cost $2 00, the use of a seton $3 00, the creation of an issue was $5 00 The treatment of a stricture with a bougie cost $2 00 to $3 00 An abscess was opened for $3 00, but the treatment of gonorrhea was priced at $5 00 A delivery varied in price from $15 to $30, the usual cost was $20 The costs of major surgery varied A lithotomy was charged at $87, the fee for ligating a carotid artery was $25, and a tumor was removed for $10 In the aforementioned amputation of an arm at the Harlem Railroad, a fee of $35 was charged A charge of $25 was made for a tracheotomy The same fee was charged for removing a nasal polyp

What kind of an income did the doctor derive from this practice? Our information on this point covers the period from April, 1846, to March, 1852, thus extending a period of two years and seven months beyond the last itemized entry in the book Dr Van Buren's gross income for the year from April, 1846, through March, 1847, was $856 Of this total, he received $310 in cash and booked $546 on credit The following year his practice brought him $441 in cash, and $2,023 on credit To this was now added $442 in cash for student fees Thus his total income increased to $2,906, of which he had received $883 in cash Year by year the grand total of Dr Van Buren's income increased From April, 1849, through March, 1850, he received $595 in cash fees from patients, $345 from students, and booked $2,792 on credit The total income was $3,732 Finally, from April, 1851, through March, 1852, his receipts were $450 from students, $887 in cash from patients, and $3,399 booked on credit, giving a grand total of $4,736

Attention must be called to the fact that fees booked on credit amounted to more than 70 per cent of the doctor's total income If one sub-

tracts the income derived from students' fees, the proportion carried on credit becomes even greater For a young doctor entering practice this was a heavy burden to bear, and complaints in the medical journals on this score were frequent Various efforts were made to deal with the evils of the credit system but without success And, as we all know, these are still with us

Summary

This brief report is intended to present a sample of the kind of data that may be derived from a study of a doctor's account book. Items in such records show the gradual spread of scientific medicine into practice Through the analysis of a number of such books one may trace how new methods entered practice and how older ones disappeared The development of specialization undoubtedly found its reflection in account books, and it would be of interest to trace this aspect of the history of medicine Finally, we return to the point from which we set out Analysis of a number of account books, comparison of this material with the data derived from fee bills, and the checking of the movements of medical prices against coincident changes of general price levels are all necessary before a firm foundation for an economic history of American medicine can be provided It is to be hoped that more American physicians will turn their historical interest toward material of this kind, which may very likely be available locally, rather than to the medicine of some distant period or place for the study of which the basic materials may not be available to them

ELISHA BARTLETT, AMERICAN CLINICIAN

SAMUEL O SAPIN, M D , New York City

(*From Mount Sinai Hospital*)

IN October, 1831, there appeared in New England a publication entitled *The Monthly Journal of Medical Literature and American Medical Student's Gazette* This was to be a journal devoted to medical history and to biographies of the famous men in medicine. Part of the editorial in the first issue read, "To the medical student and the young practitioner, to all those who aspire to any higher acquisitions than the knowledge that calomel purges and salivates and that tartarized antimony occasions vomiting, who are not willing to rest supinely satisfied in a routine familiarity which practice and habit render in the end almost mechanical—we cannot but think these matters must be interesting The devotion of an occasional hour to such pursuits must have a tendency to enlarge and liberalize the mind Delightful and fascinating in many respects as the study of his profession may be to him, there are many hours which must be occupied with mental and bodily drudgery He must make what to others would be loathsomeness pleasure to himself Amid the wear and tear, the toil and fatigue of such pursuits, he needs at times some intellectual recreation and stimulus, and where can he find one pleasanter or more appropriate than in surveying the career and studying the character of those who have trodden before him the same laborious path and who have followed it on to its high and bright consummation."

This editorial was written by Elisha Bartlett at the age of twenty-seven While the publication was short-lived, the author's ideas are still valid and timely It is hardly likely that young Bartlett, when he wrote this, knew that he would be able to follow the path to its "high and bright consummation" and that for this reason we would be reviewing his life and contributions today

Elisha Bartlett was born in Smithfield, Rhode Island, in 1804, at the start of a century which Garrison in his *History of Medicine* labels "The Beginnings of Organized Advancement of Science "[1] His parents were Quakers, and his early

Presented, by invitation at the 142nd Annual Meeting of the Medical Society of the State of New York, Session on History of Medicine May 20 1948.

life was a peaceful and happy one He attended several of the local schools but never received any formal degrees He next studied informally with several prominent New England physicians, as was the custom at the time, and then went to the Brown University Medical School He was graduated in 1826

At this time Bartlett went abroad and spent a year visiting the various medical centers in France, Italy, and England Some of the letters he wrote home are quite entertaining He described one of the professors at the medical school in Paris as looking more like a jolly stage driver or a good-natured, blustering butcher than anything else "He lectures sometimes standing, and sometimes leaning against a post, or straddling over a high stool, flourishing a lancet in one hand and a snuffbox in the other, on the contents of which he is continually laying the most inordinate contributions He wears during the time an old rusty-looking black cap The familiarity of the distinguished surgeons and physicians with their students struck me at first sight very forcibly, being in such perfect contrast to the proud port and haughty carriage of some of our New England professors I wish they might step into the Hotel Dieu and La Charité and take a lesson or two of Boyer and Dupuytren, barons of the Empire and two of the most distinguished surgeons in the world "

Bartlett returned to this country in 1827 at the age of twenty-three and set up practice in Lowell, Massachusetts, then a small textile village In 1829 he married Elizabeth Slater He was extremely interested in civic affairs, lectured on sanitation and hygiene, and, later, when Lowell became incorporated as a city, he was elected the first mayor after a hotly contested campaign He was re-elected the following year and then in 1840 was sent to the State Legislature

In 1839 Bartlett published an article in the *Lowell Courier* entitled, "A Vindication of the Character and Condition of the Females Employed in the Lowell Mills, Against the Charges Contained in the *Boston Times* and the *Boston Quarterly Review*" The Boston papers had reported that the working and living conditions of the Lowell factory girls were unsatisfactory Bartlett conducted a thorough personal investigation of the situation and concluded in this article that the charges were false, that wages were good, the social life very satisfactory, and the moral standards of the girls high He learned that many of the girls came from good homes and went into the mills because of the attractive wages, from which they hoped to accumulate a marriage dowry

The Bartlett of the early period was described by a Bishop Clark who said, "Some twenty-five years ago I used to meet a young man in the town of Lowell, whose presence carried sunshine wherever he went, whose tenderness and skill relieved the darkness of many a chamber of sickness, and whom all the community were fast learning to love and honor" From descriptions written by Elisha Huntington and Oliver Wendell Holmes, Bartlett apparently had a gentle, warm, and generous nature He was very sociable, very lively, a great conversationalist, a man of refined and elegant yet unpretentious manners, and he was respected both inside and outside his profession

Bartlett's time was not devoted exclusively to medical practice, a great part of it was spent in teaching In those days, as is well known, training in American medical schools was entirely theoretic 'Many of the schools were located in rural areas Lectures were given, some dissection was done, a few operations were watched, and the student then left school to become associated with a general practitioner From the latter the practical aspects of medicine were learned

Many of the instructors stayed at the school for only one or two sessions and then migrated to another school, their students often following them Bartlett belonged to this group of "peripatetic teachers" as Osler called them, among which were such famous men as Dunglison, Flint, Parker, Drake, and Clark.

Bartlett taught, in all, at eight different schools, returning between sessions to his home in Lowell His first appointment was in 1832 when he became professor of pathologic anatomy and materia medica at Pittsfield After eight sessions here he went to Dartmouth in 1839 where he held the Chair of Practice One of his faculty colleagues at Dartmouth was Oliver Wendell Holmes In 1841 Bartlett accepted the Chair of Medicine at Transylvania University in Lexington, Kentucky, at that time probably the foremost medical school in the West From here he wrote to a friend, "In school we are getting on very well The class is of a good size, rather larger than last year, worth a little over $2,000, intelligent, attentive, well-behaved I have given 58 lectures, and we have just six weeks more My own success has been good enough I think So far as I have means of judging my instruction is entirely satisfactory, to say the least The style of lecturing here is quite different from what it is in the East—more emphatic, more vehement It is quite necessary to fall somewhat into the popular style We stand in the lecture room on an open platform with only a little movable desk or table on which to lay our notes On the whole I like it better than being seated in a desk as they are in Boston "

Again in 1843 Bartlett wrote that his receipts

for the session were more than two thousand dollars "There are a few good families who send for me, and I get occasionally a consultation. We never make a charge less than a dollar, and consultation visits in ordinary cases—the first visit—are $5 00 These few enable me, situated as I am, to make even a small and easy business somewhat profitable I have made one visit twenty-five miles distant for which the fee was $25, and I saw a second patient at this time, incidentally, for $5 00 more You see from all this that my place gives me rather more money than I could earn in Lowell, for a much smaller amount of responsibility and labor I have hardly, indeed, been called out of bed during the winter In a business point of view I feel quite content with my situation."

In addition to his practice and his teaching activities, Bartlett was an author, and one of considerable note He had a lucid, highly polished style and, aided by his fine cultural background, he wrote on many medical and related subjects In 1831 he translated a French biography of several famous French physicians During his lifetime he also helped publish several medical journals

In 1842 Bartlett published a book entitled *The History, Diagnosis and Treatment of the Fevers of the United States* This book, Osler says, is Bartlett's claim to remembrance as far as his medical writings go, and "It remains one of the most notable of contributions of American physicians to the subject"[2]

Behind the writing of this book we find a rather interesting set of circumstances Until the early nineteenth century no differentiation of typhoid from typhus fever was made There were then a few fragmentary publications by German and French physicians of some of the pathologic and clinical features of typhoid fever However, it remained for the Frenchman, Pierre Louis, working in Paris with Chomel and Andral, to give in 1829 the first complete description of the disease It was Louis who gave it its present name, typhoid fever

Studying at that time under Louis were some American students, among them W W Gerhard and James Jackson, who became thoroughly familiar with typhoid, the then prevalent form of idiopathic continued fever in Paris When these students returned to the United States, they found that this fever was also the most prevalent form in New England The English, however, maintained that typhoid and typhus were not distinct entities, but that the former was only a mild form of typhus Accordingly, Bartlett said in the preface to his book that since these standard English texts on fevers (which were the ones used by the Americans) did not describe the common type of fever seen in New England, these books were obsolete Furthermore, Bartlett said, the work done on these fevers by Louis in France and by his American students in this country was not generally and quickly available to the American physician

For these reasons Bartlett thought it necessary to provide a new complete work on this subject He therefore collected and carefully arranged all the available literature, impartially weighed the evidence, and concluded in the book, as Louis had already done, that typhus and typhoid were two distinct forms of idiopathic continued fever Although Bartlett made no original contributions he gave a remarkably accurate and comprehensive description of the fevers, especially typhoid The author states, "My book aims at no other excellence and no higher merit than that of being a methodical and compendious summary of the actual state of our knowledge upon two most common and most important diseases"

In addition to the sections on typhoid and typhus, the continued fevers, there is a section on periodical fever (which we now know as malaria) and one on yellow fever The book was accepted with acclaim by the leading physicians of the day

In 1844, Bartlett published another classic, *An Essay on the Philosophy of Medical Science* Under the leadership again of Louis in Paris there arose the modern French school of medical observation This group attempted to stop the reign of abstract speculation and theorizing which then dominated medical thinking Bartlett in this essay tried to introduce to American medicine their ideas and methods, methods which had produced the outstanding work on typhoid fever This school, he explained, adhered strictly to the study and analysis of morbid phenomena, this study was very detailed and accurate, and the numerical method of statement and of analysis was used It rejected as a legitimate element of science all a priori reasoning and speculation. It "holds as of no binding authority all the traditions of the fathers, unless they are sustained or sanctioned by its own experience" "Science," Bartlett said, "consists of ascertained facts obtained only by observation and experience which are then generalized into laws and principles"

In the essay, the author, following along his analytic lines, lashed out against the polypharmacy so popular at that time He decried especially the heroic remedies in use, and he cited Chomel's law—it is only the second law of therapeutics to do good, the first being not to do harm

In this age of chemotherapy and antibiotics it is interesting to read what Bartlett wrote about the future prospects for the control of disease

Mentioning consumption and cancerous diseases on the one hand, and hydrophobia and tetanus on the other as examples of chronic and acute diseases which have withstood all attempts at control, he says, "For anything that yet appears to the contrary, there are many morbid conditions, which art has no power to remove—the means for the removal of which, I mean to say, do not exist It is not, merely, that we have failed to discover them, it may be that they are not in nature The morbid conditions may absolutely have no therapeutic or curative relationships" He says, however, that some of the chronic diseases, for example, consumption, may be controlled because the causes of many of these diseases are obviously to be found in the violations of the known conditions of health, we, therefore, have the power of avoiding these afflictions

This essay exerted a strong influence on American medicine There were many who resented Bartlett's attacks on prevailing doctrines and authorities Samuel Henry Dickson, writing of Bartlett's life, maintained that Bartlett's ideas were extreme, and that he minimized the need for hypothesis and theory in medicine [3] However, he admitted that Bartlett and his followers did much good by courageously attacking prevalent errors in medical practice and thinking

Dickson wrote, "His pen, we may truly affirm, was never idle," and in 1848 Bartlett published *An Inquiry Into the Degree of Certainty of Medicine and Into the Nature and Extent of Its Powers Over Disease* This was in answer to statements by some stressing the imperfections of medicine Bartlett admitted to some shortcomings but gave a very eloquent description of all that doctors had done and would continue to do for mankind Some contemporaries, however, believing that the profession never had been doubted in the first place and that Bartlett's arguments were of no great merit, strongly criticized him One review said, "This is a curious production, the like of which we have seldom seen from the pen of anyone who had passed the age of a sophomore"

Bartlett's analytic approach is evident in his book on fevers and again is well shown in his *History, Diagnosis and Treatment of Edematous Laryngitis* This, written in 1850, is a model of accuracy and thoroughness At the bedside, it was said, Bartlett also was a keen and accurate observer

Bartlett was appointed to the Chair of Materia Medica and Medical Jurisprudence at the College of Physicians and Surgeons in New York in 1851, his last teaching post While here he delivered the memorable, eloquent address on the "Times, Character, and Writings of Hippocrates" This was only one of his many talks on a variety of subjects during his life As a lecturer Bartlett was a tremendous success, his clearness and powers of illustration being notable

After only two teaching sessions, because of an obscure nervous disease, Bartlett retired to his birthplace in Rhode Island Here, in his last days, he wrote a small book of poems about the people in the novels of Charles Dickens Bartlett had always been a great admirer of Dickens, having met him in this country and exchanged letters with him subsequently These verses bring forth clearly the warm, philanthropic, humanistic nature that was Bartlett's

Finally, having become paralyzed, Bartlett died in 1855 at his birthplace, leaving a well-marked place for himself in American medical history Elisha Huntington, in a memorial address said, "I utter but the sentiment of my cotemporaries when I say that no more honorable, high-minded man ever adorned the walks of our profession" [4]

THE INTERRELATIONSHIP OF PAPILLEDEMA AND POLYCYTHEMIA

MORRIS AXELROD, M D , and SAMUEL EPSTEIN, M D , F A C P , Brooklyn, New York

(From the Medical Services of Coney Island Hospital)

THE marked frequency of neurologic and vascular manifestations in polycythemia is well known and has been amply discussed in the literature [1-5] It has been shown that fully one third of the patients with polycythemia seek medical aid primarily because of the neurologic symptoms [1] Headache, tinnitus, vertigo, blurring of vision, loss of consciousness, convulsive seizures, and aphasia may be prominent in the clinical picture. A survey of the literature indicates that papilledema is an uncommon complication of polycythemia, but, when it occurs, it adds greatly to the problems of diagnosis and management of the case In a series of 163 cases of polycythemia vera reported from the Mayo Clinic, eight were suspected of having a brain tumor Of these, four had choked disks Unless it is realized that polycythemia per se can cause papilledema, unnecessary intracranial exploration may be carried out [2,4,6] Drew and Grant gave a complete review of the literature on the relationship of papilledema and polycythemia [7] They collected 17 cases of papilledema due to polycythemia per se and reported a case of their own. We have recently had the opportunity of studying two patients in whom, because of the presence of papilledema and other neurologic signs and symptoms, an expanding intracranial lesion had to be excluded In both cases polycythemia was found to be the cause of the papilledema

Case Reports

Case 1 —M M , a forty-eight-year-old doll maker, consulted one of us on November 23, 1945, with the complaint of severe headaches of three months duration The pain was generalized but was more severe over the frontal region, lasting several weeks at a time, disappearing, and then returning At times it was accompanied by nausea but never by vomiting Irritability and weakness had been noted by the patient, but there was no evidence of change in personality During the previous two weeks, blurring of vision and occasional dizziness was noted At times there was unsteadiness of gait His past history indicated the existence of chronic cough associated with profuse expectoration of mucoid sputum of about six years duration Hemoptysis was denied A diagnosis of chronic asthmatic bronchitis had been made by the physician who attended him, and allergy tests had been done with entirely negative results Of late the patient had become aware of exertional and nocturnal dyspnea.

Physical examination revealed a patient of sthenic habitus with moderate dyspnea and cyanosis Orientation was normal. The pupils were equal and reacted to light and accommodation Nystagmus was not present, the extraocular muscles were intact The retinal veins showed marked tortuosity and engorgement Bilateral papilledema of two diopters was present No hemorrhages or exudates were noted Minimal arteriolar sclerosis was present The chest was "barrel-shaped" and hyperresonant on percussion, and generalized, expiratory musical rales were present The heart was not enlarged, the sounds were of fair quality and of regular sinus rhythm The second pulmonic sound was louder than the second aortic sound The liver and spleen were not palpable Rectal examination was negative The extremities showed no edema or clubbing Except for the papilledema, there was no evidence of cranial nerve involvement All deep and superficial reflexes were intact There were no pathologic reflexes present Sensation was normal Cerebellar signs were absent There was no aphasia or apraxia.

This history of headaches, blurred vision, and disturbances in gait, together with the finding of bilateral papilledema, pointed to an expanding intracranial lesion The possibility of polycythemia was not considered at this time.

Neurologic examination disclosed a well-developed and well-nourished middle-aged man who showed bilateral papilledema and very slight dysdiadokokinesia These were the only abnormal findings His condition was regarded as one of an expanding intracranial lesion, either in a midline or, more likely, a right cerebellar situation

The patient was hospitalized for further study on November 27, 1945 The laboratory data included normal urine, normal blood Wassermann tests, blood sugar of 108 mg per cent, urea nitrogen 11 4 mg per cent, prothrombin time 12 seconds (control 11 9 seconds), red cell fragility normal, red blood counts (Table 1), white blood count 9,750 per cu. mm., mature polymorphonuclear leukocytes 68 per cent, stab forms 3 per cent, lymphocytes 26 per cent, and monocytes 5 per cent On December 4, 1945, there were 11,500 white blood cells, mature polymorphonuclear leukocytes 79 per cent, stab forms 3 per cent, lymphocytes 18 per cent, bleeding time was three minutes, coagulation time four minutes, sedimentation rate, on two occasions, zero, circulation time with ether three seconds, with decholin fourteen seconds The venous pressure (antecubital fossa) was 120 mm of water An internal jugular vein puncture was attempted for a pressure determination but was unsuccessful

A spinal tap on December 4, 1945, showed an initial pressure of 230 mm of water The fluid was clear, containing 10 cells per cubic mm , of which 90 per cent were lymphocytes The total protein was 33 mg per cent, the sugar 109 mg per cent, chlorides 409 mg per cent. The spinal Wassermann and

colloidal gold were negative A spinal tap on December 12, 1945, showed an initial pressure of 190 mm. of water An electrocardiogram showed sinus tachycardia and right axis deviation There was elevation of the RT segments in leads 2 and 3 P_2 was large

TABLE 1.—Laboratory Data Showing Change in Blood Studies

Date	Red Blood Cells (Mil per Cu Mm.)	Hemoglobin (Per Cent)	Hematocrit (Volumes Per Cent)	Phlebotomy (500 cc Each)
11/27/45	6 07	114		
11/29/45	5 93	110	70 4	
12/4/45	5 89	114	71 7	12/10/45
12/11/45	5 8	110	60 78	12/12/45
12/13/45	5 87	110		
12/18/45	6 18	114		12/19/45

12/21/45	5 05	100	60 5	

and notched, and P_3 was large and upright These changes were consistent with the diagnosis of chronic cor pulmonale Visual field studies failed to reveal any abnormality Electroencephalography revealed no evidence of any focal lesion X-ray examinations revealed the lung fields to be emphysematous with diffuse increase in parenchymal markings The heart was not enlarged There was no evidence of bone disease of the skull The pineal body was faintly calcified and in its usual midline position Pneumoencephalography showed the ventricular system to be fairly well outlined The lateral ventricles and third and fourth ventricles were filled and showed no defects The response to phlebotomy was gratifying both symptomatically and hematologically (Table 1) The headache was dramatically relieved He was discharged on December 22, 1945, to be followed in the outpatient department Phlebotomies were done on January 15, 1946, and February 18, 1946 Eye checkup on the latter date showed the right disk to be clear, but the left still showed slight papilledema He subsequently reported to a blood bank for phlebotomy whenever severe headaches occurred

On October 18, 1946, he was admitted to the medical service of the Coney Island Hospital He gave a history of a respiratory infection five days before admission, followed by pain, swelling, and increase in temperature in the right leg The pertinent physical findings were as follows the patient appeared plethoric, cyanotic, and dyspneic, the conjunctivae were congested, the fundi showed venous engorgement with 3 1 arteriolar ratio Bilateral papilledema was present, and both fundi showed hemorrhages The blood pressure was 110/80 Regular sinus rhythm was present The heart sounds were of poor quality No murmurs were heard The lungs showed moist and crepitant rales bilaterally at the bases and generalized wheezing The liver edge was palpable three fingers below the costal margin, the spleen was not palpable The right leg was swollen and hot Three plus pitting edema and marked calf tenderness were present The left leg was normal. Neurologic examination showed no abnormalities except for the papilledema. The admission diagnosis was deep thrombophlebitis of the right leg and polycythemia with papilledema

On the following day, the dyspnea and cyanosis suddenly became worse, and peripheral collapse developed Examination showed marked dullness over the entire right chest with diminution of breath sounds in this area It was apparent that massive pulmonary infarction had occurred Symptomatic therapy was unavailing, and the patient expired within a few hours after the onset of infarction Postmortem examination was refused

On admission, the diagnosis of an expanding intracranial lesion, presumably tumor, seemed obvious The laboratory reports showing the presence of polycythemia directed our attention to the possible causative relationship of the polycythemia and the papilledema. Neurologic studies, including pneumoencephalography and electroencephalography, were normal It was felt, therefore, that an expanding lesion had been definitely excluded The sequence of events was as follows longstanding asthmatic bronchitis with resulting cor pulmonale and secondary polycythemia leading to papilledema.

Case 2.—J M, aged sixty-two, white, male, Russian-born barber, was admitted to the hospital on August 29, 1947, and died on September 15, 1947

The family revealed that the patient had shown personality changes for the past six months He had become dull, apathetic, and irresponsible His writing ability and his memory for recent events had become impaired, drowsiness and depression had become manifest

On June 29, 1947, while at work as a barber, the patient fell, striking his right occipital region on the floor He was said to have felt faint before falling and to have remained unconscious for several minutes after falling Portable roentgenograms of the skull were reported as negative The patient was kept in bed three to four weeks, during which time weakness of the left arm, but not of the left leg, was noted At the end of this period he was allowed out of bed and revealed, in addition to the left arm weakness, a tendency to drag the left leg During the week prior to admission to the hospital, weakness of the left arm and left leg became more marked, twitching movements of the fingers of the left hand were noted, the speech became slurred, and the patient's mouth was pulled up on the right side Intense headache developed the day before admission The patient's vision had appeared disturbed since the accident No history of past hypertension was elicited

Physical examination revealed a dull, apathetic, well-nourished, plethoric male, with no dyspnea, orthopnea, or edema The pupils were equal and regular and reacted to light Marked suffusion of the conjunctivae was evident The extraocular muscles were normal Funduscopic examination revealed edematous disks with elevation of three diopters The retinal veins were markedly engorged, the arterioles were narrowed and tortuous The tongue was beefy red and protruded to the left. Left central facial paresis was noted The neck veins were engorged The lungs were clear The heart

was enlarged to the left, the second aortic sound was accentuated, sinus tachycardia at a rate of 110 per minute was noted, and no murmurs were audible The liver and spleen were not palpable Paresis of the left upper and lower extremities was evident The deep reflexes were more active on the left, the Babinski sign was present on the left, while the left cremasteric and abdominal reflexes were absent, the right cremasteric and abdominal reflexes were present, a left hemisensory defect was evidenced by delayed withdrawal to pinprick.

The laboratory findings included the following data Polycythemia was evidenced by the blood counts of 6,800,000 erythrocytes per cu mm. with a hemoglobin of 18 0 Gm. on admission and on repeated examinations 7,200,000 red cells with 18 0 Gm. of hemoglobin, 7,140,000 red cells with 17 5 Gm of hemoglobin, 8,000,000 red cells with 21 0 Gm. of hemoglobin The white blood count was 8,000 cells per cu mm with a normal differential. The platelets numbered 205,000 per cu. mm. The hematocrit readings varied from 68 volumes per cent to 72 volumes per cent The blood specific gravity was greater than 1 070, and the total proteins were 6 5 Gm per cent The sternal bone marrow revealed an increase in the erythroblastic elements consistent with the diagnosis of polycythemia The blood serology was negative, the blood glucose was 92 mg per cent, the urea nitrogen 36 mg per cent, the creatinine 1 8 mg per cent, and the blood calcium 9 5 mg per cent The maximum sedimentation rate was 1 mm in five minutes Spinal tap on September 2, 1947, revealed a pressure of 12 mm of mercury 20 cc of crystal clear fluid were withdrawn Examination revealed glucose 100, chlorides 701, globulin negative, 1 white blood cell and two red blood cells per cu mm. The blood pressure readings were 156/90, 154/92, and 160/92

Roentgenographic studies revealed a linear skull fracture in the right parietal region Chest study showed minimal left ventricular prominence and moderate elongation of the aorta

The venous pressure in the antecubital veins was 6 cm. of water The jugular venous pressure was not determined. The decholin circulation time was fifteen seconds

The temperature ranged between 98 6 and 99 8 F by rectum and rose terminally to 103 F

Repeated phlebotomies of 300 to 500 cc of blood were not efficacious in influencing the course of the patient With continuation of a downhill course, exploration to rule out an expanding intracranial lesion was deemed advisable The patient was then transferred to a neurosurgical service On September 13, 1947, biparietal burr holes were made under local anesthesia. The dura was opened bilaterally and the brain was seen to be full, pouting into opening on both sides No subdural blood was present in the region of the holes The wound was closed in layers with silk. A soft rubber catheter was inserted into the left lateral ventricle for continuous drainage On September 15, 1947, the patient expired at 1 50 P.M Postmortem was not obtained.

The problems presented in the management of this patient all revolve around the possible combinations of pathogenetic factors concerned in the association of polycythemia and papilledema

On admission it was obvious that the man had a left hemiparesis as a result of damage to the right side of the brain Whether this were due to thrombosis in the right internal capsule secondary to polycythemia or arteriosclerosis or whether the skull injury had been followed by subdural hematoma with compression of the cortical motor areas was an important matter to decide Then, too, the patient had experienced changes in his personality and behavior patterns, which, in association with localizing signs and papilledema, brought the question of frontal lobe neoplasm into the differential diagnosis Even though similar personality and behavior pattern changes are well known in the course of polycythemia, secondary to multiple small cerebral thrombi, the question was not an easy one The choice lay between a simple explanation of polycythemia, papilledema, and neurologic findings—all on the basis of polycythemia per se—and an expanding intracranial lesion (subdural hematoma or neoplasm) in a patient with polycythemia

The best procedure seemed to be that suggested by Tinney, Hall, and Giffen [1] When the differential diagnosis is difficult to make—the cerebral manifestations of polycythemia vera on the one hand and brain tumor on the other—they suggest treating the patient first for the polycythemia. When the blood volume returns to normal, the cerebral manifestations improve, except where brain tissue has been injured by hemorrhage or thrombosis However, if cerebral manifestations progress despite treatment, a mass-expanding lesion should be suspected

In our case, we resorted to operative intervention. Although no postmortem examination was obtained, the findings suggest that the pathogenesis of the neurologic findings and the papilledema were all the result of polycythemia

Discussion

The interrelationship of polycythemia and papilledema can best be discussed under the following classifications

1 Polycythemia and papilledema, the latter resulting from the polycythemia per se

2 Neurogenic polycythemia with papilledema of diencephalic origin or with subtentorial tumors.

3 Polycythemia and papilledema in association with an expanding intracranial lesion not causally related to the polycythemia, eg, subdural hematoma or neoplasm

Group 1—The mechanism by which polycythemia causes papilledema depends on an increase in cerebrospinal fluid pressure resulting

from plethora of the intracranial venous system This was demonstrated by Loman and Dameshek in a patient with polycythemia, secondary to emphysema [8 9] Their patient, a forty-one-year-old man, complained of headaches and progressive loss of vision Bilateral papilledema was present Red blood counts varied from 8,100,000 to 9,000,000 per cu mm The spinal fluid pressure was 380 mm. of water Determination of the venous pressure in the cubital fossa was 80 mm of water and in the internal jugular vein 300 mm of water Following repeated venesections, the cerebrospinal fluid pressure and the internal jugular vein pressure became normal The papilledema disappeared as did the headaches and amblyopia

Case 1, observed by us, showed a similar response to phlebotomy with dramatic relief of the headache and almost complete, although temporary, relief of the papilledema Further observations on the relation of the internal jugular vein pressure and the spinal fluid pressure in cases of polycythemia should be carried out It is clear that thrombosis of the intracranial venous sinuses was not present in the cases of Loman and Dameshek or in our cases There was no clinical evidence to indicate any involvement of the cavernous, sagittal, or transverse sinuses, and, furthermore, the Queckenstedt test showed normal spinal fluid dynamics

Group 2—Experimental and clinical evidence suggests the existence of a vegetative center in the diencephalon concerned with erythropoiesis [10 11] Polycythemia has been reported as a complication of chronic encephalitis, narcolepsy, acromegaly, tumors of the hypophyseal region, and luetic involvement of the pituitary infundibular region.

Guillain reported a patient with an adenoma of the pituitary associated with polycythemia (red blood cells 6,510,000 per cu mm) [12] Removal of the neoplasm resulted in disappearance of the polycythemia, and one year later the blood count was 4,760,000 per cu mm

That neoplasms of the cerebellum can give rise to polycythemia was demonstrated by the reports of Walker and his associates [13 14] They described three patients who manifested polycythemia in association with papilledema In each case ventriculography revealed internal hydrocephalus, and surgical intervention disclosed a cerebellar tumor, which was removed. In all three cases the tumor was shown on pathologic study to be an hemangioblastoma Postoperatively, complete disappearance of the polycythemic state and the papilledema occurred. During the follow-up period (seven months to one year), there was no return of the polycythemia

It is interesting to note that in these cases the white blood count was normal and the spleen not enlarged, in contrast to what we find in polycythemia vera Two mechanisms were suggested to explain the occurrence of polycythemia with posterior fossa lesions The internal hydrocephalus might cause functional changes in the diencephalon disturbing the center for erythropoiesis It is difficult, however, to see why only a single function of the diencephalon should be selectively influenced The other explanation, which seems more likely, is that an arteriovenous shunt in the cerebellum through the vascular tumor could be the cause of functional disturbance in the medullary vegetative centers

Group 3—Polycythemia vera can be complicated by a subdural hematoma or a cerebral neoplasm not etiologically related to it In such cases operative intervention may lead, because of blood loss, to a transient disappearance of the polycythemia but within a few months the blood counts will be back to preoperative levels

Therapeutic Considerations

When papilledema is associated with polycythemia, thorough neurologic study should be carried out Examination of the visual fields, electroencephalography, and ventriculography will be necessary to exclude an expanding intracranial lesion The response to phlebotomy will be gratifying in cases in which there is no associated expanding lesion If the cerebral manifestations progress despite adequate control of the polycythemia, an expanding lesion is to be suspected, and exploration will have to be done

Summary

1 The polycythemic state may simulate, may result from, or may be associated with an expanding intracranial lesion

2 Two cases of polycythemia with papilledema simulating brain tumor are described

3 The importance of thorough neurologic study of all polycythemic patients is stressed

LEUKEMIA, LYMPHOSARCOMA, AND HODGKIN'S DISEASE

MAURICE M BLACK, M D , HERMAN BOLKER, M D , and WILLIAM E HOWES, M D ,
Brooklyn, New York

(From the Brooklyn Cancer Institute)

THE leukemias, as well as those diseases which are categorized by Wintrobe as chiefly affecting the lymph nodes, viz , lymphosarcoma and Hodgkin's disease, have led to varied speculations as to their origin and interrelation.[1] Thus, the histologic appearance of lymph nodes from chronic lymphatic leukemia is frequently indistinguishable from that appearance in lymphosarcoma Similarly, reports are not uncommon describing the apparent transformation of lymphosarcoma to leukemia either of the acute or chronic, myeloblastic or lymphoblastic varieties [1]

Hodgkin's disease, which seems from some considerations to be a bridge between infection and neoplasia, certainly behaves clinically as a malignancy In some cases its activity is indistinguishable from lymphosarcoma, and the occurrence in Hodgkin's disease of nodes which are indistinguishable from lymphosarcoma is not unknown

Perhaps most perplexing is the relation between the acute and chronic leukemias Are the two conditions fundamentally the same disease, or are they different entities? Craver, as the result of study of the voluminous material at Memorial Hospital, New York City, has stressed the shadowy borderline between various lymphomas and leukemia [2]

In view of the perplexity of the problem it seems pertinent to examine these diseases from a dynamic point of view in addition to the static picture presented on a histologic slide or blood smear This has become increasingly possible with the advent of the more recent studies in chemotherapy of neoplasia as well as certain other biochemical studies

An attempt will be made in this paper to evaluate the similarities and differences of diseases in this group from the point of view of the relations to in vivo and in vitro factors Thus, the following outline will serve to indicate some of the biologic and biochemical features by which malignant diseases may be characterized

1 Age of onset of the disease
2 Causative factors where known
3 Systemic reactions of the host
4 Biochemical and biologic reactions of the neoplasm
   (*a*) in vivo studies
   (*b*) *reactions to chemotherapy*
   (*c*) reactions to radiation

Age of Onset

While no hard and fast distinction can be made on the basis of the age of onset of these disease entities, it is clear that certain age predilection does exist Thus, the acute leukemias are most prevalent in childhood, while Hodgkin's disease usually does not appear until after puberty and is most common in the young adult On the other hand, chronic leukemias of the lymphatic and myelogenous varieties are found more often in the fourth to sixth decades Lymphosarcoma may appear at the extremes of life, although the majority of cases occur in the middle decades

Causative Factors

These observations pose a challenging problem as to a possible relation to endocrine balance Thus, it has been noted that estrogen administration in most strains of mice leads to an increased incidence of leukemia and lymphoid tumors [3–5] It has also been shown that testosterone administered with estrogens antagonizes the tumor-accelerating effect of the estrogens, although, when given alone, it neither accelerates nor retards the tumor development [6] It is also of interest to note that the carcinogenic hydrocarbons can induce myelogenous, monocytic, and lymphosarcomatous leukoses, while the estrogens induce only locally invasive lymphatic tumors or generalized lymphatic leukemia

The subject of causative agents in this group of diseases is as replete with inferences and ignorance as other malignant neoplasia However, Grand has reported on the purification and properties of an active agent in Hodgkin's disease.[7] An ultrafiltrable agent was extracted from the chest fluid and lymphoid tissue of patients with Hodgkin's disease It is apparently capable of producing specific changes in tissue cultures of normal chick, rat, and human lymph nodes, namely, the appearance in the lymphoid and reticular cells of specific cell inclusions and a relatively rapid deterioration of these cells The agent could not be isolated from patients with lymphosarcoma or leukemia Whether or not one is inclined to interpret these findings as indicative of an infectious process in Hodgkin's disease, it does provide a unique differentiation between this and the other diseases affecting the lymph nodes

Systemic Reactions of Host

The striking differences in clinical course and prognosis of these diseases cannot be overlooked Certainly, the fulminating course of the acute leukemias is in marked contrast to the chronic leukemias where the patient may feel well, be active, and have only moderate anemia in spite of marked adenopathy and hepatosplenomegaly In Hodgkin's disease and lymphosarcoma, while the course is usually much more protracted than acute leukemia, it is unusual for the patient to feel well and be active in the presence of adenopathy and hepatosplenomegaly

Attention is called to the studies on the reducing power of plasma as reported by Black [8 9] Examination of approximately 1,600 samples of plasma from normal individuals and patients with and without malignant neoplastic diseases revealed a definite decrease of the reducing power associated with approximately 80 per cent of the cases of malignant neoplasia Less than 5 per cent of the control group showed such changes The results of examination of a series of the diseases under consideration are summarized in Table 1

It will be noted that there is a marked difference in the reaction of the chronic leukemia group as compared to the other diseases We feel that this finding is significant and indicates a point of difference between the chronic leukemias and the other diseases under discussion

Reactions of the Neoplasm

In Vivo Studies

Detailed studies of biochemical changes in the tissues and cells of this group of diseases are sparse, and the results not clearly definitive Thus, studies have been made on the tissue metabolism of bone marrow [10] Except for a relatively high respiratory quotient (0 96), the metabolism of the myeloid cells is indistinguishable from that of malignant cells On the other hand, normal lymphatic tissue possesses a distinctly lower anaerobic glycolysis than is found in spontaneous mouse lymphatic leukemia [11–13]

Diverse data on biochemical changes in lymphosarcoma, lymphomas and leukemias are tabulated by Greenstein.[14] In general, the deviations listed are in keeping with changes found in other malignant neoplastic diseases On the other hand, Greene reported an inability to transplant human tissue from Hodgkin's disease, lymphosarcoma, and leukemia to the anterior chamber of the guinea-pig eye [15] This is interpreted by him as indications that they are not neoplastic diseases

Table 1.—Presence of Decreased Reducing Power of Plasma (Malignant Type Reaction) in Diseases Affecting Lymph Nodes

Disease	Number of Cases	Number with Decreased Reducing Power	Per Cent with Decreased Reducing Power
Hodgkin s disease	21	19	90 5
Lymphosarcoma	23	22	95 9
Acute leukemias	19	16	84 2
Chronic lymphatic leukemia	9	5	55 5
Chronic myelogenous leukemia	5	2	40 0

Study of the differential sensitivity of cells from normal lymph nodes, lymphoid cells from Hodgkin's tissue, lymphosarcoma, and leukemia was made by Chambers *et al*, using the tissue culture technic [16] They found the critical toxic level for the lymphoid cells of the various tissues to tetramethyl-o-phenylene diamine to be as follows

Normal lymph nodes (human and rat)	0 0075 M
Hodgkin's disease	0 0025 M
Lymphosarcoma (human and rat)	0 001–0 0025 M
Leukemic node (human)	0 001 M

These findings are quite parallel to the x-ray sensitivity of the diseases

Reactions to Chemotherapy

The use of a therapeutic trial of specific drugs as an aid to diagnosis is an established procedure in medicine By the same token, the response of neoplastic tissue to specific chemicals or modes of therapy may be used to categorize them and to throw light on their metabolic activity We shall consider the reactions of the diseases under discussion to four diverse chemical entities which have been shown to have reproducible destructive action on neoplastic tissue

Arsenicals—The use of Fowler's solution for the treatment of chronic myelogenous leukemia is well known Definite remissions may be produced, and the decrease in circulating granulocytes is distinct and quite readily achieved In contrast, little or no effect is obtained in chronic lymphatic leukemia, the acute leukemias, Hodgkin's disease, or lymphosarcoma

Urethane—Striking effects on the blood count in chronic myelogenous leukemia was reported by Haddow *et al* [17] It was shown that remissions in the blood count and clinical course could be induced by the use of urethane The effects produced were similar to those achieved by x-ray

Chronic lymphatic leukemia may show favorable response in some instances but not nearly as regularly or dramatically as myelogenous leukemia

In acute leukemia the effect of urethane is not as striking Although some instances of decrease in the immature white cells of the polymorphonuclear series have been noted, the results are disappointing and sporadic

There is no evidence that urethane is of any real value in the treatment of Hodgkin's disease or lymphosarcoma

Nitrogen Mustards—These have been extensively tested in various neoplastic diseases Excellent reviews covering the use of these compounds may be found in the American Association for the Advancement of Science, Symposium on Approaches to Tumor Chemotherapy [18] It is generally agreed that Hodgkin's disease shows marked sensitivity to these agents resulting in regression of glands and clinical remissions of varying lengths

The results in the treatment of lymphosarcoma, while somewhat similar to those in Hodgkin's disease, are not as constant or as striking

Chronic lymphatic leukemia may respond in some cases with a drop in count and partial remission However, the group survival is much poorer than in Hodgkin's disease The results in chronic myelogenous leukemia are not very noteworthy, and only slight specificity is demonstrable in the leukemic cells In acute leukemia the action is again lacking in specificity although some temporary remissions have been reported

Glycolytic Inhibitors—The effect of sodium fluoride, iodoacetic acid, and malonic acid on malignant neoplastic tissue was reported by Black and Kleiner and Black, Kleiner, and Bolker [19 20] Studies of their cellular and tissue effects were reported by Bolker, Black, and Kleiner [21] While the use of these agents is still in its early stages, it is singularly important that they do not have any noticeable effect on normal tissues in the doses employed

While improvement has been obtained in acute leukemia, lymphosarcoma, and Hodgkin's disease, no change attended the use of these agents in chronic lymphatic or chronic myelogenous leukemia The distinct separation of the chronic leukemias on this basis is noteworthy

X-Ray

The sensitivity of abnormal cells to radiation closely parallels the sensitivity of the normal structures from which the neoplastic cells arose Thus the reaction of Hodgkin's granuloma will vary in its sensitivity to the amount of fibrous tissue present The lymphocyte is notoriously sensitive to the x-ray beam Large lymphosarcomatous masses will respond to small doses of radiation by immediate and, at times, almost miraculous diminution in size The lymphocyte in the leukemic states also responds, but there is usually a lesser response, in that leukemic glandular masses will not shrink to the extent of lymphosarcomatous tissue The lymphocytes in the circulating blood are also sensitive to small doses of radiation, and this, in some ways, hastens their maturation and discharge from the circulating blood The effect of radiation on the abnormal granulocytic cells, myelocytes, and more mature forms is even more striking than seen in its effect in lymphatic leukemia Radiation induces a reduction in the numbers of white blood cells within the peripheral blood stream, diminution in the size of the spleen and of leukemic masses, and usually results in definite clinical improvement

This clinical improvement following moderate doses of radiation is practically never observed in the treatment of acute leukemia In fact, radiation even in smallest doses frequently results in accentuation of symptoms and a more rapid downhill course in the patient so treated These observations are shown in Table 2

The use of the therapeutic response to radiation in diagnosis has also been suggested by Palazzo and Desjardins [22–24] These results are in agreement with our own

Discussion

The use of various dynamic points of reference would seem to distinguish chronic lymphatic leukemia, chronic myelogenous leukemia, the acute leukemias, Hodgkin's disease, and lymphosarcoma By this means a consecutive differentiation of the various diseases is possible, very much as with a flow chart in chemical analysis The results obtained with the reducing time studies and the effects of glycolytic inhibitors seem to separate the chronic leukemias from the other diseases under discussion While the implications of these observations are still incomplete, they provide an interesting departure for further investigation

Custer and Bernhard have reported on an unusually complete study of biopsy and autopsy material from the Army Institute of Pathology [25]

TABLE 2.—EFFECT OF X-RAY

Disease	Local Effect of X ray	Constitutional Effect of X ray
Hodgkin s disease	Improvement which varies with chronicity of process	Improvement which varies with chronicity and extent of disease
Lymphosarcoma	Immediate and striking local effect	Precipitous local effect may sometimes result in more rapid deterioration (overdosage)
Chronic lymphatic leukemia	Marked local effect	Improvement
Chronic myelogenous leukemia	Marked local effect	Improvement
Acute lymphatic leukemia	Minimal local effect	No improvement
Acute myelogenous leukemia	Minimal local effect	No improvement

Their conclusions include the following "(1) Instead of there being five or more separate and distinct neoplasms of lymphoid tissue, there is one (2) This single tumor entity may adopt any one of at least seven different histologic patterns (3) These may occur singly or in combination in a given patient, or there may be a distinct transition from one type to another during the course of the patient's disease"

Although this report indicates that the majority of cases subjected to repeat biopsy and autopsy examination may reveal transition between Hodgkin's disease, lymphosarcoma, fibrosarcoma, and leukemia, such fluctuation in the clinical course and biologic character of the disease is exceptional Thus, if the first biopsy of a glandular enlargement reveals lymphosarcoma, one may predict the clinical course, radiosensitivity, chemotherapeutic response, etc, with a high degree of accuracy This is also true for the other diseases under discussion This would not be possible were the character of the disease to vary with each change in the histologic picture described above Were this the case, clinical and therapeutic differentiation would be well-nigh nonexistent

It is well known that marked variation in histologic appearance may occur between primary carcinoma and its metastatic foci Furthermore, change may also occur in the appearance of the primary growth with the passage of time and the advent of therapy. Yet, the clinical and therapeutic characteristics of the disease are essentially a function of the primary growth and not given to change with each variation in histologic appearance of the metastases All too often, a metastatic lesion cannot be identified as to its site of origin, yet, for the most part, the course of the disease and site of metastases corresponds to the site of origin, not the appearance of the peripheral spread

By the same token it is not amiss to stress the importance of the identity of the early lymphomatous enlargement as indicative of the clinical and therapeutic characterization of the process Changes which occur later, subsequent to radiation or in tissue foreign to the site of origin, may often be as nonrepresentative of the original picture as may be metastatic foci in carcinoma

In summary, it appears justified to infer that despite apparent merging and overlap of histologic appearance in some instances, acute leukemia, chronic lymphatic leukemia, chronic myelogenous leukemia, Hodgkin's disease, and lymphosarcoma constitute distinct disease entities Such a concept has the value of utility in therapy and further investigation of the biologic characteristics of these diseases

ADDITIONAL ANNUAL REPORTS

MEDICAL SOCIETY OF THE STATE OF NEW YORK

1948—1949

Report of the Malpractice Insurance and Defense Board

The Malpractice Insurance and Defense Board consists of the following

Leo F Schiff, M D , *Chairman*	Plattsburg
Christopher Wood, M.D , *Vice-Chairman*	White Plains
Charles Gordon Heyd, M.D	New York City
John F Kelley, M.D	Utica
Thomas M D'Angelo M D	Jackson Heights
Walter P Anderton, M D ex officio	New York City
James R. Reuling, M.D ex officio	Bayside
William F Martin, ex officio	New York City
Harry F Wanvig ex officio, *Secretary*	New York City

The following annual report is submitted

Introduction.—The major problems confronting your Malpractice Insurance and Defense Board during the past year have been (*a*) The continuing rise in the number and cost of malpractice suits and claims and the consequent increase in insurance rates, and (*b*) search for a satisfactory insurance company to replace the Yorkshire as the carrier of our Group Plan of malpractice insurance and defense

Rising Loss Costs—Causes —(1) The cost of losses, through the application of sound actuarial principles, determines insurance rates, and, under our agreement with the insurance carrier, we are obligated to meet our increasing loss costs by establishing adequate premium rates In 1921, the cost of $5,000 malpractice insurance protection was $18 Today, the cost of the same amount of protection is $55 in the metropolitan area and $40 in the upstate counties The difference between those rates illustrates graphically the extent to which malpractice loss costs have risen in this State

(2) Our study of these rising costs shows that they have not been the direct result of any one cause but the combined effect of several causes—some beyond, but many within, our power to control

(3) The factors beyond our control are the inflationary tendencies of the present day which have contributed materially to our rising costs.

(4) The factors which lie within our control are those which give rise to preventable suits and claims Physicians, of course, are not infallible, and a certain number of bad results will always occur due to the margin of error which is inherent in all human endeavors These are not considered preventable claims On the other hand, we must direct our attention toward the preventable errors which may cause claims, such as those due to carelessness or poor judgment

(5) An attempt to bring these matters to the attention of individual physicians was made in a letter from the Board which is being enclosed with each certificate issued after January 1 of this year, which, in part, reads as follows

> Every year, the public becomes more claim conscious, more claims of a serious nature are being filed, and courts and juries are holding the profession to strict accountability This demands, as never before, that every member of the Society exercise utmost vigilance to prevent carelessness both on his own part and that of his assistants and to limit his procedures to those he knows to be safe and accepted No operation or other procedure should be undertaken unless the doctor knows, beyond doubt, that he is competent to carry out the proposed treatment Last, but not least, the doctor, by every word and act, must convince the patient that he has the health, comfort, and welfare of the patient at heart

(6) We emphasize the fact that *behind every malpractice claim is a dissatisfied patient* This dissatisfaction may arise from a bad result, real or fancied, but aggravated in many cases by what the patient regards as careless, unsympathetic, or neglectful treatment by the doctor or by charges which he believes are out of proportion to the services rendered In some cases, these factors constitute the entire basis for the dissatisfaction. A small percentage of patients probably would not be satisfied with perfection itself, but, in far too many cases, the attitude of the physician himself is the chief, and in some instances, the only cause of the dissatisfaction. To these causes of claims we must again add that of criticism of the acts of another physician. Doctors have an obligation to their patients to inform them fully and accurately as to their condition, but there should be no room in our practice of medicine for needless criticism of fellow doctors.

(7) The growth of these preventable claims must not be allowed to go unchecked The time has come when we must unite in a carefully planned program to eliminate these and to reduce all malpractice actions to a minimum This program should consist of two parts, (*a*) elimination of undesirable risks from protection under our Group plan, and (*b*) prevention of claims at their source

Elimination of Undesirable Risks.—(1) Elimination of undesirable risks from the Group Plan may seem like locking the barn after the horse is stolen, but the possibility of being denied further insurance protection will do much to prevent carelessness, to stimulate better judgment, and to prevent the undertaking of procedures which members are incompetent to carry out.

(2) Last year, the House of Delegates authorized

this Board to deny renewal of insurance of a member found guilty of acts for which "no excuse, in common decency, can be found" In addition, the Council has authority under the Regulations Governing Malpractice Defense and Group Insurance to limit the amount of insurance which a member may have and to deny renewal of insurance of a member whose medical procedure, conduct, or attitude constitutes, in the opinion of competent medical opinion, a burden to the Group Plan more hazardous than that contemplated in the competent practice of medicine Action under these authorities has been taken in several cases, but it is believed that these penalties are too severe in many cases where a milder, temporary penalty would, in all probability, accomplish the desired result and at the same time preserve some measure of protection for otherwise worthy members of the Society

(3) In such cases, the Board recommends the adoption of a deductible average clause which, when attached to a member's policy, would make him a coinsurer with the company, and, as such, require him to bear some stated part of any future losses caused by him In the absence of any further claims against him, the deductible amount would be decreased from year to year until the member would again be granted full coverage This system has been in use for a number of years in several counties in California and has been responsible for a substantial decrease in the number of claims filed and in the cost of insurance The Board believes that it would be equally effective in New York and urges that it be authorized for application to our Group Plan if and when approved by the State Insurance Department

(4) To centralize the powers now divided between the Council and this Board and to implement the application of the deductible average clause where warranted in particular cases, the Board recommends that the Regulations Governing Malpractice Defense and Group Insurance be amended by adding the following paragraph at the end of Section II as it appears on page 21 of the Regulations published by the Society in 1946

> The authority to limit the amount of insurance protection granted to any member and the authority to withdraw the privilege of renewal of indemnity insurance under the Group Plan under conditions hereinabove stated is hereby delegated to the Malpractice Insurance and Defense Board and shall be one of the duties of the Board
>
> The Board may, in lieu of withdrawing the privilege of renewal of insurance from a member under the conditions stated, order that a deductible average clause in some given amount be applied to the renewal of such insurance
>
> Any member whose insurance is affected by a decision of the Board shall have the right of appeal to the Council. The decision of the Council shall be final.

Claim Prevention—(1) Last year, the House of Delegates instructed the Council to study the so-called "Alameda County (California) Plan" and to institute as soon as feasible procedures looking toward the employment of measures of like nature in the constituent societies or district branches of the Medical Society of the State of New York At a subsequent meeting of the Council, the responsibility for this investigation was turned over to this Board

(2) A preliminary study of the situation, through correspondence with officials of the Alameda County Medical Association, brought out the fact that the "plan" is a somewhat revolutionary and rather ambitious venture into wide fields of public relations, physician-patient relations, and medical economics, working at the county level Malpractice claim prevention is only a corollary part of this program Three of the members of this Board had an opportunity to contact the executive secretary of the Alameda County Medical Association at St Louis in December, and a subcommittee has been ordered to visit Alameda County without delay to complete the study on the ground In the meantime the claim prevention programs in New Jersey and Connecticut are being examined, and the Board hopes to complete these studies in time for inclusion with recommendations in a supplementary report to this House of Delegates

(3) In the supplemental report the Board will recommend a uniform plan of education, supervision, and cooperation at the county level, backed up, where necessary, by penalties in connection with a member's insurance at the State level

(4) The elimination of undesirable risks from the Group Plan and, if approved by the Insurance Department, the adoption of the use of deductible average clauses will be potent deterrents to carelessness, thoughtlessness, and taking unwarranted risks in the practice of medicine and will have an appreciable effect upon our loss costs But, in our opinion, the effect of these measures will be far less than that which will flow from a coordinated attack upon the underlying causes of malpractice actions at their source

New Insurance Carrier for the Group Plan.—(1) On July 1, 1948, the Yorkshire Indemnity Company asked to be relieved of the malpractice insurance business of the State Society When it was found that no other company was immediately available to take their place, they agreed to continue our business until a satisfactory replacement could be found, provided the Society would approve higher rates and consent to dividing the State for rating purposes, and that was done

(2) Now, we are glad the Board is able to report that it has found a first class company willing to undertake the Group Plan under favorable terms, and we have concluded an agreement with them which was approved by the Council on February 10, 1949 The company is the Employers Mutual Liability Insurance Company of Wisconsin, one of the largest mutual liability insurance companies in America. In 1947 their premium income was $51,000,000 and their assets at the year's end totaled $70,000,000 They are entered in every state in the union and are rated by Alfred M Best as A+ (excellent) AAAAA The present officers are the men who organized the company in 1911 and who have brought it to its present eminent position in the insurance world

(3) In agreeing to undertake our business, the company has accepted all the requirements for the Group Plan as adopted by the House of Delegates and amended by the Council

(4) Under the agreement with the Employers, 68.5 per cent of premiums will be available for the payment of losses as against 66 per cent under our present plan This will apply to all limits of insurance, whereas heretofore the permissible loss ratio has applied only to the minimum limits of $5,000/$15,000

(5) Malpractice is different from all other forms of insurance in that the excessive lag in the reporting of claims and the final disposal of them has, in the past, been responsible for high loss ratios which have developed many years after the rates were fixed and

the premiums collected. No one has yet found a satisfactory way to rate insurance of this character, and this fact, more than any other, has made the business unpopular among insurance companies. The Board has studied this problem in an effort to find a solution for it and has finally devised a plan whereby a part of each premium (referred to as surcharge) will be set aside to establish, in the hands of the insurance company, a contingent loss reserve or fund for each year's business, which can be called upon to pay unforeseen losses which may develop in the future, in the event that the base rates for that year prove to be inadequate When the loss liability for any given year has been determined with a reasonable degree of accuracy, any surplus remaining in the fund will be available to defray claim prevention activities, or as a credit to our loss experience for the purpose of reducing our rates or surcharges of later years. If the reserve fund proves to be inadequate, the surcharge of a subsequent year will be increased enough to make up the deficit

(6) In the meantime, the base rates will be computed on our regular experience formula, and every effort will be made to make them adequate to carry the business without calling upon the contingent reserve. This plan is calculated to prevent either side of the agreement from profiting, even unintentionally, at the expense of the other, and that is the prime purpose of our Group Plan.

(7) The Board visualizes that the contingent loss reserve will develop into a revolving fund which can be credited from one year to another, so that, in a few years, the surcharges can be reduced or discontinued entirely, thus reducing the amount of our annual premium.

(8) Our rates under the new agreement, predicated upon our loss experience up to the end of 1948, have been computed on the basis recommended by the Society's actuaries, Messrs Wolfe, Corcoran, and Linder, and the new permissible loss ratio They are as follows

	Basic Rates	Surcharges	Annual Premium
Metropolitan area including Westchester and Nassau Counties	$50	$5	$55
Upstate counties including Suffolk	$39	$3	$42

As will be seen, these do not affect the annual premiums in the metropolitan area, but they do increase the premium by $2 00 in the upstate counties where there has been a very heavy increase in loss costs However, these premiums include the surcharges forming the contingent loss reserve, which will remain the property of the Group Plan.

(9) Under the agreement, all policies will be issued on an annual basis except during the first six months when members who are then in the first six months of their annual policy year will receive six months policies to return them to their normal expiration dates Thereafter they will receive annual policies. This is necessary to redistribute the business throughout the year

(10) The agreement will become effective at 12 01 A M July 1 1949 At that time, the Yorkshire will discontinue writing malpractice insurance in this State and the Employers will take over The agreement has no expiration date, but it may be terminated by either party upon written notice to the other six months prior to the termination date Naturally, the Yorkshire Indemnity Company will continue to serve the members of this Society under the terms of policies that have been issued up to July 1, 1949, so long as liability under them remains

(11) Rates will be computed on the calendar year basis as heretofore, but all rate changes will become effective on the first of July

(12) In brief, we now have a large, prosperous company of high standing to take over our malpractice insurance under all the Society's requirements for the Group Plan at a 68 5 per cent loss ratio applying to all limits of insurance and at rates justified by our own tabulation of loss costs together with the contingent loss reserve plan devised and recommended by the Malpractice Insurance and Defense Board.

(13) In the opinion of the Board, this is the most favorable carrying agreement the Society has ever had, and it is most important that the members of the Society understand and appreciate the value to them of this splendid solution of their malpractice insurance problems.

The Yorkshire Indemnity Insurance Company—(1) For the past thirteen years the Yorkshire Indemnity Company has carried the Group Plan and has lived up to the spirit as well as the letter of its agreement with the Society Not once has the Company resorted to any legal technicality or in any other way sought to avoid giving full protection to every member of the Society who needed it Mr Alan O Robinson, the executive vice-president, and his assistant, Mr Horace Crowell, have patiently sought to find constructive and helpful solutions for our malpractice insurance problems, and, in the face of constantly mounting deficits, they have continued to carry our business long after another company might have discontinued it

(2) Your Board feels it is but fitting, as we approach the termination of our fine association with the Yorkshire Indemnity Company, to record our deep appreciation to the Company and its officers for their loyalty and the fine service rendered the members of the Medical Society of the State of New York

Number of Members Insured in the Group Plan—The attached is a statement of the number of members insured in the Group Plan by counties and the percentage of those insured to the total membership (Table 1) These have been arranged in the order of the percentage insured.

REPORT OF THE COUNCIL

PART XII

MISCELLANEOUS

Medical Licensure

The Committee on Medical Licensure has the following membership

Nelson W Strohm, M D , *Chairman*	Buffalo
Morris Maslon, M D	Glens Falls
Ivan N Peterson, M D	Owego

The Committee herewith presents for the consideration of the Medical Society of the State of New York the following information

This Committee with the same personnel gave its previous report at the 1948 Annual Meeting of the Medical Society of the State of New York covering the period from January 1, 1946, to June 1, 1947 We compared the data on licensure in New York State with that of the other states and reviewed the figures for New York State in detail That report discussed the basic science law as it functions in those states where it is a law and presented the reasons why we believe it to be undesirable The previous report listed the requirements for licensure in New York State, which have not been changed to date However, certain proposed changes are listed herein The policy of the New York State Department of Education on endorsement of licenses was outlined, and in this report we wish to call attention further to some of the problems arising in the practice of so granting licenses

For comparative purposes, we have reviewed the licensure statistics as presented by the Council on Medical Education and Hospitals of the American Medical Association for the year 1947

The total number of licenses issued in the United States, including the District of Columbia, Alaska, Hawaii, Puerto Rico, and the Virgin Islands, was by examination 6,747, and on the basis of reciprocity and endorsement 7,682, making a total of 14,429 This decrease from 1946, in which year 16,231 licenses were issued, was due to a decrease in the number licensed without examination, which was a reversal of the previous trend This reversal of the previous year's trend nationally was not followed in New York State, where the increase continued, due to the number of licenses granted to foreign applicants

The greatest number of licenses granted during the calendar year of 1947 by any one state was again in California, where 1,868 were issued In New York, which was second in this respect, 1,645 licenses were granted

These figures represent physicians registering in more than one state in this year The total number receiving their first license and therefore representing additions to the medical profession in the United States and its territories is 6,855, of which 5,257 were by examination and 1,598 were by reciprocity and endorsement In New York State, there were 1,063 additions to the medical profession as compared to the 1,645 licenses issued. Of these 1,063 new members of the profession, which was the greatest addition in any one state, 447 were licensed by examination and 616 by endorsement

During 1947, the number of physicians removed by death in the United States and its possessions was 3,515, thus leaving an apparent physician population increase of 3,280 new licentiates The total additions to the profession in 1947 for the continental United States is 110 less than for 1946, which saw many medical officers returning to private practice Otherwise, the trend of increase over the past thirteen years persists The estimated number of physicians in the continental United States as of April 1, 1948, was 199,764 In New York State, the total number of physicians registered as of January 1, 1949, was 31,937

From a total of 7,124 examined in the United States during 1947, of the group of 5,645 graduates of approved medical schools in the country, 3 1 per cent failed, whereas 11 8 per cent of Canadian graduates, 17 9 per cent of graduates of extinct schools, 52 9 per cent of foreign graduates, 42 5 per cent of graduates of unapproved schools, and 18 3 per cent from schools of osteopathy failed It is of importance to note that, from 1930 through 1947, a total of 14,520 foreign medical school graduates have been examined in this country, and of that number and excluding the graduates of Canadian schools, 6,973 or 48 per cent failed

In New York State, of 1,092 examined, 39 from schools within the State or 3 6 per cent failed, while 80 from 36 schools outside the State or 7 3 per cent failed Also in New York State, of those from approved schools, 57 who had failed once in New York were licensed, and five who had failed once elsewhere were licensed after examination. Twenty-five who had had two or more failures were licensed Of graduates of foreign schools, 30 who had failed once in New York State were licensed, and 39 who had failed more than once were licensed Of graduates of unapproved schools and schools of osteopathy, 31 who had failed once in New York and four who had failed once elsewhere were licensed Eleven who had failed more than once in New York, one who had failed more than once elsewhere, and 24 who had failed more than once both in New York and elsewhere were licensed. This is a total of 240 licensed who had previously failed

Of physicians examined on the basis of credentials obtained elsewhere than in the United States and Canada, New York had a total of 387, of which 137 passed and 250 failed with a percentage failure of 64.6 No other state examined more than 40 In this regard the ruling continues in force that matriculates of a date later than January 1, 1940, are not accepted. This ruling was made because of the deterioration of European medical schools subsequent to that date At the present time the problem is much different. We are informed that an increasing number of applications are being received by New York State from the displaced persons group, with foreign credentials of a date prior to 1940 in 90 per cent of the cases Most of these applicants have not been in active practice for some years For reasons that are apparent, it would seem that such applicants for examination should be required to have had an additional defined amount of study in an approved school before admission to examinations Since the endorsement of foreign licenses rests with the Board of Regents, we believe that a definite position on this matter should be taken by the Medical Society of the State of New York and such position be represented to the Board of Regents of the State of New York

There has also been noted an increasing number of applications from English physicians who are anxious to separate themselves from the present system of medical practice in England

The power of endorsement of licenses of other states rests with the Committee on Endorsement, and its policies continue similarly to previous years There were a total of 1,035 licenses issued by endorsement in 1947 which is slightly less than the 1,081 endorsed in 1946 Seven hundred and two of the 1947 group so licensed without examination presented certificates of the National Board of Medical Examiners Five schools of New York State require their students to take the National Board's examinations The number licensed by such endorsement by New York far exceeded that in any other state, Massachusetts being next with 272, and California third with 244.

The marked increase in those obtaining licenses by reciprocity or endorsement throughout the United States continued in 1947 as in 1946, and is explained as previously by the number of physicians, returning from war, relocating in other states than where they originally practiced or were licensed. California was the only state exceeding New York in the number so licensed for 1947

New York licensed 132 osteopathic physicians by examination in 1947, as against 111 licensed in 1946

As previously pointed out, New York State does not require an internship for license Nationally, however, six medical schools in the United States and four in Canada require internship for graduation Twenty-three state medical licensing boards, plus the Connecticut Homeopathic Board and the boards of the District of Columbia, Alaska, Canal Zone, Hawaii, Puerto Rico, and the Virgin Islands, require internship for licensure

As we have indicated, there has been no change in the requirements for licensure in New York State to the date of writing this report However, there has been introduced into the legislature during the month of February, 1949, a bill which calls for an increase in fees for examination, endorsement, and biennial registration We are informed that this bill was drawn without conference with representatives of this Society

As a summary, and to bring this report up to the latest date for available statistics, we are in conclusion giving the tabulated reports of the New York State Board of Medical Examiners for the period from October, 1947, through October, 1948 (Tables 1 and 2)

SUMMARY OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK*

AT ITS meeting on February 10, 1949, the Council considered the following matters, taking action as indicated.

Secretary s Report

Remission of Assessments—Remission of annual assessments was voted on account of service with the armed forces for two members for 1948 and three members for 1947 On account of illness, annual assessments for 15 members were remitted for 1948 and 17 for 1949, also 24 War Memorial assessments were remitted on account of illness, and one was refunded

Dr Eugene L Opie, New York County, was nominated for Associate Fellowship in the American Medical Association

Communications—Dr John J Masterson, chairman of the nominating committee of United Medical Service, Inc , submitted for nomination as Physician Directors of the First Class to serve until the annual meeting of voting members in 1952 the names of John B D'Albora, M D , Chester O Davison, M D , Milton S Lloyd, M D , and William B Rawls, M D *Approval was voted*

Dr A M Mitchell, chairman of the National Conference of County Medical Society Officers of the American Medical Association, requested appointment of a chairman to assist in making arrangements and creating interest

It was voted to reappoint Dr Charles F McCarty as chairman for New York State

Request from Dr Cary Eggleston, president of the United States Pharmacopoeial Convention 1940–1950, to send from one to three representatives to a meeting regarding the U S Pharmacopoeia at Hotel Statler, Washington, May 9 and May 10

It was voted that the Board of Trustees be requested to appropriate a sum not to exceed $75 for expenses of one representative, to be appointed by the President

After discussion of a letter regarding expenses of Committee on Public Health and Education,

It was voted to pay Mrs O W H Mitchell monthly rent for the space in her residence, and to pay the committee's telephone expenses

In reply to a letter, the Council *voted* to appoint the following committee Dr John J Masterson, chairman, Dr Floyd S Winslow, Dr W P Anderton, Dr Nathan B Van Etten, and Dr A F R Andresen to report at the next meeting about future direction of the educational program of the Public Health and Education Committee

A January 26 telegram was announced from Mr Oscar Ewing regretting his inability to debate at Annual Meeting May 3

As a result of a letter,

It was voted that Mr W A Richardson, editor of *Medical Economics*, be invited to address the House of Delegates and also be on the Teaching Day Program

As a result of notice from the American Medical Association that our Society is entitled to three additional members of its House of Delegates, the Secretary announced he had notified Drs Clarence G Bandler, W Guernsey Frey, Jr , and B Wallace Hamilton that they had been elevated from alternates to delegates

The following presidential appointments were *approved* Dr Robert F Lapham and Dr A H Aaron, members of Prize Essays Committee, Dr Frederic W Holcomb, chairman of Committee on Legislation, Dr John C Brady, member of Committee on Legislation, Dr Ralph T B Todd, chairman of Subcommittee on Rehabilitation, of Committee on Public Health and Education

The President *was voted* power to appoint one additional member to this subcommittee

Approval was voted of appointment of the following to be regional chairmen in Internal Medicine for the Committee on Public Health and Education The President *was delegated* power to appoint chairmen for the fourth and sixth regions.

Region	Chairman
1	Scott Johnson, New York City
2	Alfred P Ingegno, Brooklyn
3	Scott Lord Smith, Poughkeepsie
4	(Not yet appointed)
5	L Whittington Gorham, Albany
6	(Not yet appointed)
7	John M Rice, Watertown
8	Charles D Post, Syracuse
9	Chester H Berlinghof, Binghamton
10	Benedict Duffy, Rochester
11	F S Hassett, Elmira
12	Roy L Scott, Buffalo

Treasurer's Report was accepted

Report of the Executive Officer

Dr Hannon reported that the Legislature has appointed two new Regents, one Mr Brosnan in place of Dr Brady and Mr Holzman in place of Regent Brandeis

Report of Committees

Legislation.—Dr Holcomb, chairman, reported that Dr Anderton, Dr Hannon, and himself had attended a Wicks Commission hearing He emphasized that unless a united definite action on the part of county societies and their memberships is achieved in relation to the anticult injunction bill, it will not get far He announced a meeting of the County Societies Legislative Committee Chairmen on February 17 in Albany Dr Holcomb requested consideration of a resolution for the Legislature against compulsory health insurance

Convention—Dr Wertz, chairman, read a letter from Dr Ingegno, chairman of Scientific Program Subcommittee, suggesting that expenses be paid for New York State essayists who are full-time teachers or researchers

It was voted that the present policy be continued, not to pay expenses of New York essayists at State Society Scientific Section and Session meetings

Economics.—Mr Farrell reported an interview with the executive secretary of the New York State Public High School Athletic Protection Plan, Inc It was authoritatively stated that this organization had not been officially approved by the State Society

The Council approved Mr Farrell's reappointment to the Statistical Committee of the American Medical Care Plans

The Council *voted* that a copy of the letter from the president of the Medical Society of the State

of Pennsylvania and the Ten-Point Program be furnished members of the Council before its next meeting

Ethics.—On December 9, 1948, the Council referred to the Committee on Questions on Ethics a letter from Dr William A. Petry, president of the Medical Society of the County of Greene, inquiring whether or not the State Society approved of a member using "F A C S," "F I C S," "Diplomate of Am. Bd of Int Med.," on stationery, business cards, prescription blanks, etc

The committee recommended that the use of such titles or other specialty designation be approved as long as such titles were in good taste The committee recommended that the interpretation of the expression "good taste" be within the power of each component county medical society for its own membership

This recommendation *was approved*

Dr J H. Arseneau, president of the Wayne County Medical Society inquired for six doctors (1) Is it ethical that they should advertise in the local papers that they are moving their offices to the newly erected clinic building either in one ad for all six or individually?, and, (2) Is it ethical that they should have invitations distributed either by mail or through the local papers for their patients to come for an institutional open house or preopening inspection?

It was voted that the Secretary be instructed to state that the Council believes it is unethical so to proceed according to the ethics of the American Medical Association

Malpractice Insurance and Defense Board.—Dr Charles Gordon Heyd explained about replacing the Yorkshire Indemnity Company, as carrier of the malpractice defense insurance, with the Employers Mutual Liability Insurance Company of Wausau, Wisconsin. The Board recommended that the Council adopt a resolution substantially as follows

"WHEREAS, The Yorkshire Indemnity Company has carried the malpractice insurance of the members of the Medical Society of the State of New York under an agreement entered into with the Society in 1936 and has now asked to be relieved of that agreement effective June 30, 1949, and

"WHEREAS, during the thirteen years the Company has carried our malpractice insurance, they have scrupulously lived up to the spirit as well as the letter of their agreement, striving at all times to furnish the maximum protection to members of the Society, and

"WHEREAS, in the face of constantly mounting deficits, they have continued to carry our business long past the time when, in ordinary circumstances, they might properly have sought to be relieved of it, now therefore

"*Be it resolved*, that the Medical Society of the State of New York express to Mr Alan O Robinson and his assistant, Mr Horace Crowell, its thanks and appreciation of their loyalty and the fine service rendered the members of this Society by their Company"

It was voted that the above resolution be adopted

The Council *voted* to thank Dr Heyd and the Malpractice Insurance and Defense Board for the excellent work they have done, and that the Council approve of the recommendations of the Malpractice Insurance and Defense Board, and to accept the Employers Mutual Liability Insurance Company of Wausau, Wisconsin, as the carrier, and the increase in rates starting July 1, 1949, at 12 01 A.M

Dr Anderton stated that the report of the Malpractice Insurance and Defense Board contains the following statement,

"The Board recommends that the Board of Trustees appropriate the necessary funds to send the legal counsel and the indemnity representative to San Francisco at an early date to complete the study ordered by the House of Delegates" (referring to the study of the Alameda County Medical Association Plan)

After discussion,

It was voted that the Board of Trustees be requested to appropriate a sum not to exceed $1,500 for the expenses of the legal counsel and indemnity representative going to California for such study

Another recommendation in Dr Schiff's report stated that "Authority is requested for the Board to undertake, experimentally, a part of the Alameda County program The Board desires to enlist the cooperation of a medium size county society in appointing a special committee or delegating to one of its standing committees authority to call before it each member of the county society who is sued, to hear him and examine hospital or other available records, to determine, if possible, whether the defendant has been guilty of malpractice, error, or mistake, to assist in developing a sound theory of defense, and to assist, if required, in securing the best defense witnesses available—none of which would entail expense to the State Society nor abridge the rights or protection of the members concerned It is understood that a member may refuse to appear before the committee but it is believed that when the helpful purpose of the undertaking becomes known, medical opinion in the county would approve and support it

It was voted to accept this recommendation

Medical Service.—Dr Wertz reported in detail what had transpired when he attended a meeting in Chicago of the National Conference on Medical Service

Planning Committee for Medical Policies.—Dr Kenney, chairman, made a progress report

Publication.—Dr Kosmak, chairman, reported about the increasing cost of our publications, the deficit in cost of the *Directory*, and recommended discontinuing publication of the full minutes of the Council in the JOURNAL

It was decided to publish in the JOURNAL the subjects discussed by the Council, with a footnote that any member may obtain more complete information from his county society secretary, and to distribute mimeographed Council minutes to each county society secretary

It was voted to accept the Publication Committee report with appreciation of the effort that the editor and the secretary are making to adapt this program to the space available in the JOURNAL

Public Health and Education.—A letter from Dr Charles D Post explained the activities of the Committee

Public Relations.—Dr Winslow, chairman, reported the activities and immediate objectives of this committee

Liaison with the Veterans Administration.—Dr Bauckus, chairman, reported that the Committee had met with representatives of seven veterans organizations on February 9, 1949 There was a discussion of the features in our plan. The representatives felt that each veteran should have a free

choice of physician and hospital Dr Bauckus also reported that he had been notified by the local branch office of Veterans Administration that they would like a meeting soon about the renewal of our contract which expires March 31, 1949

Workmen's Compensation —Dr Kenney, chairman, reported that he had received inquiries concerning the right of podiatrists to use x-rays in the diagnosis and treatment of foot conditions, he reported on the practice of medicine by hospitals, new fee schedule, civil service physicians, mileage fees, fees for subsequent compensation complaints, complaints against insurance carriers representatives, radiology examinations, and arbitrations

New Business

A.M A. Assessment.—The Council *voted* to endorse the $25 assessment levied by the House of Delegates and the Board of Trustees of the American Medical Association

---

* Official copy of the minutes has been sent to the secretary of each component county medical society

---

Fellowship in the American Medical Association

The attention of members of the State Society is called to the following extracts from the Constitution and Bylaws of the American Medical Association regarding Fellowship, the advantage of which must be evident The payment of dues includes an annual subscription to the *Journal of the A M.A* , an important and informative publication which should be in the hands of every physician It is likewise to be noted that no part of the dues paid to the constituent county societies are apportioned to the American Medical Association

Bylaws (1948)—Chapter IV

Section 2 Qualifications, Election, Rights and Duties —(A) Member and Service Fellows —(1) Member Fellows Active members of the Association who have made proper application to the Secretary and who are approved for Fellowship by the Judicial Council shall be Member Fellows An applicant for Fellowship must possess the degree of Doctor of Medicine or Bachelor of Medicine granted by a school or college of medicine accredited by the American Medical Association

The Judicial Council in its discretion may approve for Fellowship any active member (1) who holds a degree equal in requirement to that of Doctor of Medicine but who has not graduated at a school accredited by the American Medical Association or (2) who formerly was a Member Fellow, provided he does not base his practice on an exclusive dogma or sectarian system.

A Member Fellow shall retain his Fellowship as long as he is an active member of the Association and complies with the provisions of the constitution and bylaws and the Principles of Medical Ethics of the Association

A Member Fellow shall pay annual dues not to exceed twelve dollars as may be determined by the Board of Trustees and announced in the *Journal of the American Medical Association* or any special scientific journal published by the Association Dues shall be payable in advance on January 1 of each year Any Member Fellow who is delinquent in the payment of his dues for one year shall forfeit his Fellowship if he fails to pay the delinquent dues within thirty days after notice of his delinquency has been mailed by the Secretary to his last known address

NECROLOGY

Herbert Louis Gaus, M D, died on March 6 at the age of sixty-five Brigadier General Gaus a retired physician residing in Stonehenge received his medical degree from Albany Medical College in 1907 He had been a member of the National Guard since 1907 and during the first World War served with the 7th Division in France He was formerly associated with St Peter's Hospital, Albany, Bender Laboratory, Steuben County Laboratory, and the Massachusetts Eye and Ear Infirmary and had practiced as a physician both in Albany and Ticonderoga. General Gaus served as medical adviser to the adjutant general for selective service in New York State At the time of his death he was a consultant oculist on the staff of the Moses Ludington Hospital in Ticonderoga.

William Vincent Healey, M.D, fifty-seven, director of surgery at St Clare's Hospital since its establishment in 1934, died at the Hospital on March 9 after suffering a heart attack a week earlier Dr Healey, a graduate of the Cornell University College of Medicine in 1916, was credited with having developed the intern and residency training program and with establishing the scientific laboratories at St. Clare's. He served overseas with the Army Medical Corps and was discharged with the rank of captain. After the Armistice Dr Healey served with various reconstruction hospitals and then later was on the staffs of Polyclinic Gouverneur and the old Broad Street Hospitals, New York. He was a fellow of the American College of Surgeons and the American Academy of Compensation Medicine, honorary surgeon of the New York Police Department, and a member of the New York State and County Medical Societies and the American Medical Association He was also a surgeon at Kings Park Hospital, Long Island

Jeanette Potter Himmelsbach, M.D, Buffalo, died on March 12 Eighty-one-year-old Dr Himmelsbach was one of six women graduated from the University of Buffalo, School of Medicine in 1890 She practiced in Ithaca until her marriage in 1893 to Dr George A. Himmelsbach

Edward L Keyes, M D, one of the leading urologists in the United States who retired in 1939 after forty years of practice died of a heart attack at his New York residence on March 15 Dr Keyes was seventy-five years old He received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1895 He had held the following teaching posts lecturer in urology at Georgetown Medical School from 1902 to 1906, associate professor of urology at Polyclinic Medical School from 1903 to 1908, lecturer on surgery at Cornell University Medical School from 1904 to 1910, and professor of urology at the latter school from 1910 to 1937 He had been urologist on the staff of New York Hospital and at the time of his death served as consultant urologist on the staff of that Hospital and as consultant surgeon to Bellevue Hospital. He was also attending surgeon on the staff of St Vincent's Hospital from 1905 to 1920 and from 1920 to 1932 urologist

Dr Keyes was the first specialist sent overseas in the first World War to guard American soldiers from venereal disease He was a major in the Medical Corps attached to Base Hospital No 1 and later attained the rank of colonel with the title of consultant in urology to the A.E F

He was the author of many textbooks in urology, and in January, 1938, he received the first award of the William Freeman Snow Medal for distinguished service in the field of social hygiene He was an honorary fellow of Royal College of Surgeons and an officer of the Legion of Honor A former president of the American Society of Social Hygiene, the American Association of Genito-Urinary Surgeons, the Clinical Urological Association, and the International Urological Association, and a former vice-president of the New York Academy of Medicine, Dr Keyes was a diplomate of the American Board of Urology and a fellow of the American College of Surgeons His membership in medical organizations included also the American Urological Association, the American Medical Association, and the New York State and County Medical Societies

Jerome Henry Leadley, M.D, of Rochester, died on February 24 at the age of forty-four Dr Leadley received his medical degree from the University of Rochester, School of Medicine and Dentistry, in 1930 His hospital affiliations included the positions of assistant physician in the department of obstetrics and gynecology at Strong Memorial Hospital and associate obstetrician at Rochester General Hospital. He was a member of the Rochester Academy of Medicine, the New York State and Monroe County Medical Societies, and the American Medical Association

Harry Sidney Newman, M D, aged fifty, died on March 13 of a heart attack. A resident of Yonkers Dr Newman was a graduate of the University of Virginia Medical School in the year 1925 He interned at Montefiore Hospital, Bronx, later joining the staff As well as being a member of the Yonkers General Hospital staff, he was associate attending physician in the division of pulmonary disease at Montefiore Hospital. A fellow of the College of Chest Physicians and the New York Academy of Medicine, Dr Newman was president of the Montefiore Hospital Alumni Association and a member of the New York State and Westchester County Medical Societies, the American Medical Association, and the American Trudeau Society

Henry Woodruff Titus, M.D, recently retired pediatrician and obstetrician of New Rochelle, died at the age of seventy-three on March 17 Dr Titus was graduated from the College of Physicians and Surgeons, Columbia University, in 1902 and served as an intern and resident at St Luke's Hospital until 1904. After brief service at New York, Sloane Maternity, and New York Foundling Hospitals, he made a round-the-world cruise as physician on a private yacht He began practicing in New Rochelle in 1908, becoming an associate physician at New Rochelle Hospital shortly thereafter, and subsequently president of the medical board of the Hospital. He also served as chief of the Hospital's obstetric staff and later as director of pediatric service He served as a major in the Army Medical Corps during World War I in France

Dr Titus was for many years head of the pediatric service at Grasslands Hospital Valhalla and at his death was consulting pediatrician to New Rochelle Hospital the United Hospital, Port Chester, and Lawrence Hospital, Bronxville A licentiate of the American Board of Pediatrics and a fellow of the American Academy of Pediatrics and the New York

HOSPITAL NEWS

Sydenham Becomes City Hospital

HARLEM's Sydenham Hospital, virtually the only voluntary hospital in New York City to admit private patients of Negro physicians, has been taken over by the City In desperate financial straits, the Hospital requested the City Department of Hospitals to take it over, which the Board of Estimate voted to do on a sixty-day lease pending necessary legal and financial adjustments

Dr Marcus D Kogel, City Commissioner of Hospitals, announced that Sydenham Hospital would continue to provide facilities for semiprivate and private beds, and that the City promised to retain the best features of the interracial private hospital Dr Israel O Weissman, director of Sydenham, has been asked to remain at his post and to keep intact his present operating staff

Although the records of New York City do not show a precedent for operating a public hospital with accommodations for private physicians beyond the assignment of single rooms or space for the care of persons with chronic ailments, there are many precedents in other cities, Dr Kogel stated

A formal meeting to work out plans will be held shortly, it was announced

NEWS NOTES

Dr David E Block, Madalin, has been named chairman of the medical staff at the Northern Dutchess Health Center, Rhinebeck Other officers include Dr William G Thompson, Rhinebeck, vice-chairman, and Dr Frederick S Zipser, Red Hook, secretary

Beth Israel Hospital, New York City, has purchased land and buildings adjoining its present site, and will erect a fourteen-story building to house a laboratory, outpatient clinic, and nurses' home, it has been announced Ground is to be broken in two months

Cancer detection clinics have been opened recently in Albany, one at the Albany Hospital and the other at the Memorial Hospital Dr John K Meneely, Jr , is director of the center at the Albany Hospital

Specialists from the University of Buffalo Medical School met recently with the staff of the Wyoming County Community Hospital for a discussion on "Acute Conditions of the Abdomen " Guest speakers were Dr Paul Kennedy, Meyer Memorial Hospital, and Dr Murray Howland, Buffalo General Hospital

Dr Hans Selye, professor and director of the Institute of Experimental Medicine and Surgery of the University of Montreal, gave the Isidore Friesner Lecture at Mount Sinai Hospital, New York City, on March 1 His topic was "Hypertension as a Disease of Adaptation "

At the monthly clinical conference at Mount Sinai Hospital, New York City, March 21, the following presented papers "Pertussis Vaccine Encephalopathy," Dr Bennet Gemson, "Traumatic Hemopericardium—Management," Dr Louis B Turner, "Nutritional Requirements in Surgical Convalescence," Dr John J Bookman, "Systemic Disease Controlled by Paranasal Sinus Therapy," Dr Joseph L Goldman and Dr Leon M Arnold, and "Pheochromocytoma—Newer Methods of Diagnosis," Dr Raymond S Megibow

According to its annual report, Meadowbrook Hospital, Mineola, had its busiest year ever in 1948, admitting 6,811 patients, an increase of 14 per cent over 1947, the previous record year More than 777,000 patients have entered the hospital since it was opened in 1935 Dr Alexander J McRae is superintendent

As a memorial to Dr Frederic H Bartlett, pediatrician and attending physician at Babies Hospital of the Columbia-Presbyterian Medical Center, who died last year, a committee has been formed to raise a fund to endow one or more hospital beds for underprivileged children, at the hospital The committee is composed of "Bartlett Babies" and of other Bartlett admirers Donations may be mailed to the Frederic H Bartlett Memorial Committee, Presbyterian Hospital, New York City

Dr Bartlett was the author of a popular book, *Infants and Children—Their Feeding and Growth*

The staff of the Binghamton City Hospital has adopted the following resolution following the death of Dr Joseph F Roe, a member of the staff

"WHEREAS, in fraternal affairs Dr Roe attained to the highest offices of the Masonic Order where his sage counsel was widely sought, and

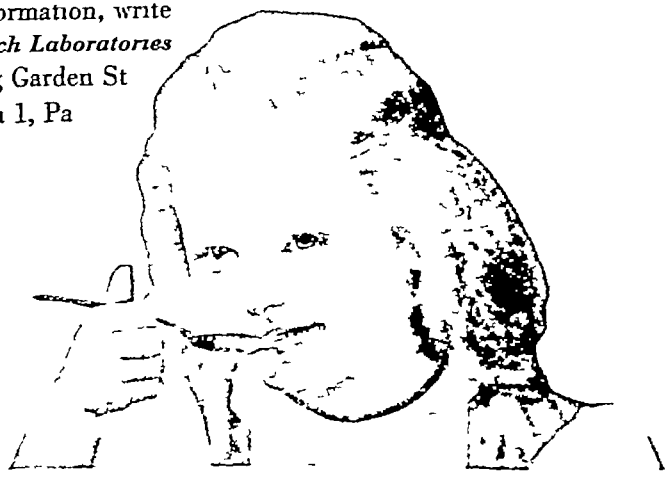
"WHEREAS, the Medical Society of the State of New York honored him at their annual meeting in Buffalo in May, 1947, for his attainment of fifty years of active practice, and

WHEREAS, the memory will long be cherished of a gentleman and physician devoted to the alleviation of illness and to the finer humanities,

"Be it therefore resolved that the staff of the Binghamton City Hospital mourns the loss of a distinguished member, the City of Binghamton an outstanding citizen, and

"Be it further resolved that a copy of these resolutions be spread on the minutes of the staff of the Binghamton City Hospital and further copies be sent to the Medical Society of the State of New York and to the family of Dr Joseph F Roe "

Announcing an unusually palatable liquid penicillin for oral use



Eskacillin

ESKACILLIN is pleasant tasting and easy-to-give Your patients—children, the aged and others who balk at tablets and bitter mixtures—will actually like to take ESKACILLIN In addition, ESKACILLIN

1 Spares children the pain and disturbance of injections
2 Spares parents the chore of crushing tablets and coaxing sick children to swallow an unappealing mixture
3 Maintains its potency for 7 full days when kept in a refrigerator

One teaspoonful (5 cc) of ESKACILLIN contains 50,000 units of crystalline penicillin G—the same potency as the usual oral penicillin tablet

MEDICAL NEWS

State Death Rate at New Low in 1948

A NEW low death rate of 10 8 per 1,000 of population in New York was established in 1948, the State Health Department announced recently The 1947 death rate was 11 1

Births in 1948 numbered 302,051, compared with 325,092 in 1947, when an all-time record was set The 1948 birth rate of 20 7 per 1,000 of population was the highest in a quarter of a century with the exception of the 1947 rate of 22 8

New low death rates were established last year for a number of diseases Among these was a rate for tuberculosis of 35 5 per 100,000 population, a decline of 1 3 from 1947 There were 5,179 deaths from tuberculosis last year This represented a drop of 1,200 in the number of deaths since 1943 and a decline of 24 per cent in the rate in the five years

The death rate for influenza was 0 8 per 100,000, half of the previous low rate set in 1947 The rate for pneumonia dropped from 39 6 in 1947 to 35 2 Among other record low rates set in 1948 were those from acute rheumatic fever, 0 6, a drop of 0 2, appendicitis, 3, a drop of 0 4, and acute and chronic nephritis, 39 7, a drop from 42 5

Although no record was established, deaths from heart diseases in 1948 represented a rate of 422 5 per 100,000 persons, compared with 425 9 in 1947 Heart ailments, the most important cause of death, took 61,500 lives in the State last year

The chief adverse factor, the Health Department reported, was the continuous increase in deaths from cirrhosis of the liver These deaths numbered 2,454 in 1948, setting a death rate of 16 8 per 100,000 persons, the highest since 1912

Deaths from cancer, which takes the second largest toll, also increased, totaling 25,700 The rate was 176 3, an increase of 1 2 over 1947 Deaths from diabetes rose from a rate of 41 9 two years ago to 42 7 last year Cerebral hemorrhage and apoplexy, the third most important cause of death, took 10,733 lives compared with 10,499 in 1947 Whooping cough caused 30 deaths, 12 fewer than in 1947, while streptoccocal sore throat, including scarlet fever, took 23 lives compared with 36 in 1947 These represented new low death rates Diphtheria caused 11 deaths, two more than the all-time low of nine set in 1944

Announce Research Grants Totaling $2,040,900

RESEARCH grants totaling $2,040,900 to finance medical and allied research projects at non-Federal institutions in 30 states, Alaska, Puerto Rico, and the District of Columbia were announced recently by Oscar R Ewing, Federal Security Administrator The grants were awarded following recommendation by the National Advisory Health Council and approval by Surgeon General Leonard A Scheele of the U S Public Health Service

The grants program is administered by the National Institutes of Health through its Division of Research Grants and Fellowships

A list of the approved grants to physicians in New York State follows

Dr Crawford J Campbell, Albany Medical College, for study of bone grafts, preserved and fresh, autoplastic and homoplastic, $1,300

Dr Charles L Fox, Jr , College of Physicians and Surgeons, Columbia University, electrolyte changes in infectious diseases, $5,076

Dr Elvin A Kabat, College of Physicians and Surgeons, Columbia University, purification, standardization, and characterization of blood group substances (A, B, and O), $11,934

Dr Hattie E Alexander, College of Physicians and Surgeons, Columbia University, evaluation of therapeutic efficacy of streptomycin and other adjuncts in tuberculosis in infants and children, $6,933

Dr David Nachmansohn, Columbia University, chemical mechanism of nervous action, $14,000

Dr Erwin Chargaff, Columbia University, chemical and biologic properties of nucleic acids and nucleoproteins, $11,000

Dr Robert C Elderfield, Columbia University, study of the in vitro degradation of antimalarials, $30,186

Dr Charles Glen King, Columbia University, biochemical study of vitamin C, $12,485

Dr Leonard J Goldwater, Columbia University School of Public Health of the Faculty of Medicine, study of the nutritional and biochemical effects of the aromatic hydrocarbons, halogenated hydrocarbons, and nitrobenzene derivatives, $5,000

Dr Walsh McDermott, Cornell University Medical College, antimicrobial therapy of tuberculosis with special reference to host resistance, $12,549

Dr Henry L Barnett, Cornell University Medical College, renal physiology in premature and full-term newborn infants, $18,414

Dr James B Hamilton, Long Island College of Medicine, growth and function of pilosebaceous apparatus with special reference to acne, $4,806

Dr S Arthur Localio, New York Post-Graduate Hospital, biologic chemistry of wound healing—effect of amino acids, $4,060

Dr Evan W Thomas, New York University, rapid treatment of syphilis with penicillin, $32,724

Dr Edith M Lincoln, New York University, treatment of tuberculous children with streptomycin, promizole, PAS, and other drugs, $15,692

Dr Richard C de Bodo, New York University College of Medicine, relation of the anterior pituitary to carbohydrate and protein metabolism, $7,938

Dr William Steenken, Trudeau Foundation, study of the biologic properties of tubercle bacilli that are resistant to streptomycin, $25,596

Dr Joseph E Macmanus, University of Buffalo, extent of interference with the blood supply of the esophagus compatible with satisfactory healing of anastomoses of this organ, $1,836

Dr Elmer H Stotz, University of Rochester, School of Medicine and Dentistry, mechanism of biologic fat synthesis and oxidation, $8,640

Puzzling Symptoms?

Neuritis, lack of appetite, migrating aches lassitude and chronic fatigue, skin eruptions —all these symptoms may indicate partial or minor deficiency in the vitamins of the B group Advanced deficiency may produce the less common pellagra or beri beri.

B Complex Preparations Armour

offers full therapeutic value for these deficiencies In the preparation of Armour B Complex glanules and liquid every precaution is taken to insure potency, activity and physiologic balance

ARMOUR B COMPLEX PREPARATIONS

ARMOUR THERAPEUTIC B COMPLEX TABLETS

Each tablet contains

Secondary Liver Fraction	0 6 gram
Thiamine Hydrochloride	10 0 milligrams
Riboflavin	20 0 milligrams
Pyridoxine HCl (Vitamin B_6)	0 5 milligrams
Calcium Pantothenate	5 0 milligrams
Niacinamide	150 0 milligrams

Suggested dose One tablet per day or as directed by physician. Available in boxes of 100 tablets.

ARMOUR B COMPLEX HIGH POTENCY CAPSULETTES

Each capsulette contains at least

Secondary Liver Fraction	0 4 gram
Thiamine Hydrochloride	2.0 milligrams
Riboflavin	4.0 milligrams
Pyridoxine HCl (Vitamin B_6)	0 25 milligrams
Calcium Pantothenate	2.5 milligrams
Niacinamide	20.0 milligrams

Suggested dose One to two capsulettes three times a day at mealtime or as directed by physician. Available in boxes of 100 capsulettes.

ARMOUR B COMPLEX CONCENTRATE (LIQUID)

Each fluid drachm (one teaspoonful) contains at least

Vitamin B_1 (Thiamine Hydrochloride)	0 450 milligram
Vitamin B_2 (Riboflavin)	80 0 micrograms
Nicotinic Acid	1 250 milligrams
Liver Extract and Yeast Concentrate	200 0 milligrams

(Derived from 8 grams fresh liver and 0 2 grams fresh yeast.)
Suggested dose One to two teaspoonfuls three times a day or as directed by physician. Available in 8 oz. bottles.

Have confidence in the preparation you prescribe—specify "Armour"

Free Radioisotopes for Cancer Research Now Available

THE United States Atomic Energy Commission has announced that it will make available to qualified cancer research workers in the United States, without charge, all radioisotopes now being sold Dr Shields Warren, director of the Commission's Division of Biology and Medicine, said the action will result in a significant enlargement of the Commission's four-point cancer program This program, announced in March, 1948, has as its basic objective the development of the use of radioactive substances in studies of the nature of cancer, its diagnosis, and treatment

The free isotopes will be allocated for the following purposes (1) cancer investigations involving animal subjects, (2) research programs studying basic cellular metabolism of cancerous cells, and (3) experimental programs designed to evaluate the therapeutic use of radioactive materials

Under the program, three radioisotopes—those of the elements iodine, phosphorus, and sodium—were previously available free of production costs for use in cancer research The new policy will make available on a free basis the radioisotopes of more than 50 additional elements Notable among these is the radioisotope of the element cobalt, known as Cobalt-60, which promises to become an effective substitute for radium Two other important cancer research materials that will now be available without charge are the radioisotopes of the elements gold and carbon

For further information address the United States Atomic Energy Commission, Washington 25, D C

Institute of Industrial Medicine to Inaugurate Course

BEGINNING March 3, the Institute of Industrial Medicine of the New York University-Bellevue Medical Center, inaugurated a course in "Medicine in Industry" for third-year students at the New York University College of Medicine, Dr A. J Lanza, chairman of the Institute, has announced

Extending over a period of twelve weeks, the course will include lectures in dust diseases, lead, solvents, dermatoses, psychiatry in industry, applied physiology of respiration as applied to dust diseases, organization and administration of industrial medical departments, physical factors in industry, research, and physical examinations

In addition to Dr Lanza, lecturers will include Dr David H Goldstein, assistant professor of preventive medicine, and medical director of the New York Times Company, Dr Norton Nelson, director of the laboratory of industrial toxicology, and associate professor of preventive medicine (industrial medicine), Dr E D Palmes, assistant professor of preventive medicine (industrial medicine), Dr William Leifer, associate clinical professor of dermatology, all of the New York University-Bellevue Medical Center, and Dr Lydia Giberson, psychiatrist on the staff of the Metropolitan Life Insurance Company

Medical Board Established at NYU-Bellevue Medical Center

A MEDICAL board of 31 doctors was recently established at the New York University-Bellevue Medical Center The function of the board is to concern itself with all clinical facilities of the hospital, including the University hospital and clinics, and affiliated hospitals where teaching is done The membership of the board is composed of members of the faculties of the recently merged New York University College of Medicine and New York Post-Graduate Medical School

The following five administrative members were elected to the board ex officio Edwin A Salmon, director of the Medical Center, Dr Edward M Bernecker, administrator of Hospital Services, Dr Donal Sheehan, chairman of the Scientific Committee, Dr Currier McEwen, dean of the College of Medicine, and Dr Robert Boggs, acting dean of the Post-Graduate Medical School

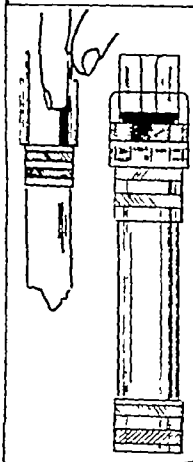
Officers elected at the board's first meeting were Dr John H Mulholland, chairman, Dr J William Hinton, vice-chairman, and Dr Clarence E de la Chapelle, secretary

MEDICALLY SPEAKING—

Polio Grants to Columbia and NYU—Columbia University will receive $11,240 for the investigation of so-called muscle spasm in poliomyelitis, it was announced recently in a joint statement made by Mr Basil O'Connor, president of the National Foundation for Infantile Paralysis, and Dr Willard C Rappelye, dean of Columbia University's Faculty of Medicine In addition, New York University College of Medicine will receive a total of $23,215 to carry on work in the control of polio In a statement by Dr Harry Woodburn Chase, chancellor of the University, and by Mr O'Connor, it was announced that the National Foundation for Infantile Paralysis will grant $10,215 for a course in virus diseases and $13,000 for research in the transmission and diagnosis of polio to the New York University College of Medicine

City Hospital Announces Refresher Course in Medicine—City Hospital announces that the Spring Session of the Refresher Course in Medicine will be given from May 2 through June 3, 1949

The course is a comprehensive review in internal medicine and the related specialties designed to meet the needs of the general practitioner The subjects include diagnosis, cardiology, allergy, pulmonary disease, fundoscopy, gastroenterology, hematology, and peripheral vascular disease



Classes will be held at the Welfare Island Dispensary on Monday, Wednesday, and Friday mornings and Tuesday and Thursday afternoons Students may register for the entire course or for special subjects. There is no fee

Requests for applications should be sent to Dr

HEMOGLOBINOMETER

GOULD

The newest type unit for hemoglobin determination that eliminates need for blood sample. Employing the principles of transillumination and color-matching the Gould HEMOGLOBINOMETER* accomplishes in seconds what more cumbersome apparatus required minutes to accomplish. Patient inserts finger and reading is taken immediately. For office, home, hospital or where an immediate determination may be imperative. Fits into the palm of the hand. Quick, accurate readings immediately obtainable. Standardized to the Photo-Electric Hemoglobinometer.

Bloodless HEMOGLOBIN DETERMINATION

Milton B Rosenblatt, Welfare Island Dispensary, 80th Street and East End Avenue, New York, 21

David Anderson-Berry Prize—A David Anderson-Berry silver-gilt medal, together with a sum of money amounting to about £100, will be awarded in 1950 by the Royal Society of Edinburgh to the person, who, in the opinion of the Council, has recently produced the best work on the therapeutic effect of x-rays on human diseases

Applications for this prize are invited They may be based on both published and unpublished work and should be accompanied by copies of relevant papers Applications must be in the hands of the General Secretary, Royal Society of Edinburgh, 22 George Street, Edinburgh, 2, by March 31, 1950

Utah Fourth State to Petition Congress—The United States Senate and House of Representatives received, on February 22, a resolution from the Utah State Senate Congress was memorialized not to enact legislation providing for socialized medicine or national compulsory health insurance, and the State Senate urge that legislation be restricted to measures which will encourage private health insurance in cooperation with the private practice of medicine

Sterling-Winthrop Institute's New Laboratory Nearing Completion—Sterling-Winthrop Research Institute will start moving into its new $3,000,000 laboratory building in June of this year, Dr Maurice L Tainter, vice-president and director, has announced Moving operations will take place over a period of three months, and formal opening will be held later in the year, he said.

Medical Scholars Receive Markle Grants—The John and Mary R Markle Foundation has named thirteen medical scholars as the second group of "Scholars of Medical Science" to pursue special studies. A sum of $325,000 will be allotted at the rate of $5,000 per year for a period of five years to the medical schools where the beneficiaries now hold appointments

Among those receiving grants was Dr W Clark Wescoe, Cornell University Medical College, for research in pharmacology

Blood Banks—At a meeting held in Washington February 13, between committees of the American Medical Association and the American Red Cross to study the subject of blood bank centers, a plan was developed to survey the situation throughout the country At present, the total blood bank reserves are unknown, and it is important to be informed of what further expansion is necessary and how mobilization of resources can be achieved rapidly in case of emergency It was disclosed at the conference that there would be 34 Red Cross Blood Centers in operation by July 1, 1949

Foundation Prize—The South Atlantic Association of Obstetricians and Gynecologists announces the establishment of "The Foundation Prize." Authors of papers on obstetric or gynecologic subjects desiring to compete for the prize may obtain information from Dr E D Colvin, Secretary-Treasurer, 1259 Clifton Road, N E, Atlanta, Georgia.

American College of Chest Physicians—The Board of Examiners of the American College of Chest Physicians announces that the next oral and written examinations for fellowship will be held in Atlantic City, June 2, 1949 Candidates for fellowship in the College, who would like to take the examinations, should contact the Executive Secretary, American College of Chest Physicians, 500 North Dearborn Street, Chicago 10, Illinois.

Illinois Physicians Pay Assessment—The 10,000 physicians belonging to the Illinois State Medical Society are willingly and rapidly paying the $25 assessment asked of them to block socialized medicine, it was reported last month by Dr Harold M Camp, secretary of the Society Already six of the 90 county medical societies have paid in full. These societies, among the smaller component groups of the Illinois society, with memberships ranging from half a dozen to 50, illustrate the spirit with which the great majority of the physicians of Illinois have received the assessment Instead of objecting to it, they are willing to contribute even more, if necessary, to protect the freedom of American medicine for the sake of the health and welfare of the American people As to the larger societies, Dr Camp stated that they are not expected to attain 100 per cent compliance The larger the group, the greater the chance that a few dissidents will be found—men who, for reasons best known to themselves or perhaps their favorite psychiatrists, favor socialization of medicine A very few others disagree with the tactics of the A M A., although they are solidly against socialization However, the gleeful predictions made by some proponents of government medicine that a large number of physicians will refuse to pay are definitely wrong as regards Illinois

Calling Dr Rembrandt—If you plan to exhibit at the Atlantic City Exhibition (A M A., June 6 to 10, 1949), now is the time to write for entry blanks, rules, shipping labels, etc Haste is necessary because your entries must reach Atlantic City between April 15 and May 9 For details please write airmail to Francis H Redewill, M D, Secretary, American Physicians Art Association, Flood Building, San Francisco California.

MEETINGS

PAST

Association for the Advancement of Psychotherapy

The February 25 meeting of the Association for the Advancement of Psychotherapy was held jointly with the New York Society for Speech and Voice Therapy, Inc Dr Joseph Wilder delivered a lecture on "Extracortical Speech Disturbances"

A Higher Standard In Sulfonamide Therapy

REDUCED RENAL HAZARD
MORE RAPID INSTITUTION OF BLOOD LEVEL
AUTOMATIC ALKALIZATION

Use of sulfonamide mixtures, called "the most efficient single measure to minimize renal complications," accounts for the superiority of Aldiazol Presenting sulfadiazine and sulfathiazole in a microcrystalline state together with sodiums citrate and lactate for automatic urinary alkalization, Aldiazol produces more rapid initial sulfonamide absorption, leads to satisfactory maintenance of therapeutic blood levels, and almost completely eliminates the danger of crystalluria (2 per cent) It does not burden the kidneys unnecessarily as does sodium bicarbonate alkalization Aldiazol thus combines high efficacy with minimal toxicity The palatability of this liquid preparation makes it especially useful in pediatrics Indicated whenever sulfonamide therapy is called for

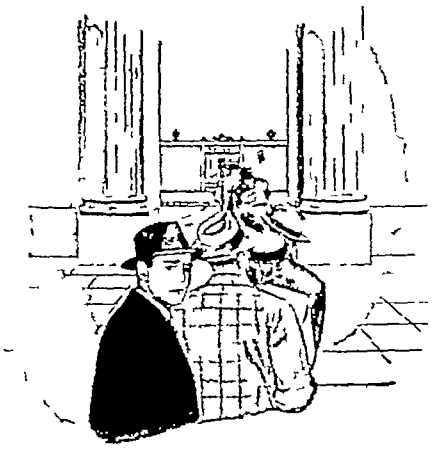
The Roswell Park Medal to Dr Evarts A Graham for outstanding surgical achievement, by the Buffalo Surgical Society Dr Graham will give the Roswell Park Lecture at the Kleinhans Music Hall, Buffalo, at 9 00 P M on May 5 Dr Harold C Wiggers, professor of physiology and pharmacology at Albany Medical College, granted $9,600 by U S Public Health Service for continued research in heart disease and circulatory disorders



Retired

Dr Lewis Wade Heizer, supervisor of health and physical education in Watertown's public school system since October, 1929, because of ill health

Appointed

Long Island College of Medicine—Dr Harold Russell Merwarth, as associate professor of clinical neurology in the Department of Neurology, and Drs Gerald Richard O'Brien, Edward A. Griffin, and Ethelbert A Callaghan, as assistant professors

[Continued on page 968]

THIS IS HARD

BUT THIS IS EASY

AND THIS IS MIGHTY WONDERFUL

SURE, you believe in saving

But it's hard to take cash out of your pocket, time out of your day, to do it regularly

The sure way, the *easy* way to do your saving is to get started on an *automatic* savings plan with U S Savings Bonds Like this

1 If you're on a payroll, sign up in the Payroll Savings Plan, then forget it From then on the money saves itself—so much per week, or so much per month

2 If you're not on a payroll, sign up at your bank for the Bond-A-Month Plan You decide how much to put into bonds, your bank does the rest

In just ten years after you start buying bonds, your money starts coming back to you —$4 for every $3 you put in

And remember—any time you need your money for emergencies, you can get it back in minutes without losing interest

Automatic saving is sure saving—U.S. Savings Bonds

Dr Charles A Weymuller, professor of pediatrics, Long Island College of Medicine, addressed a joint meeting of the pediatric section of the Westchester County Medical Society and county obstetricians recently His topic was "Mortality of the Premature"

NECROLOGY

[Continued from page 955]

Academy of Medicine, he was a past president of the Westchester County Medical Society and the New Rochelle Medical Society As well as being a charter member of the Westchester Obstetrical and Gynecological Society, he also belonged to the New York Obstetrical Society, the New York State and Westchester County Medical Societies, and the American Medical Association

Alfred Winslow Wheeler, M.D , seventy-five, died February 28 of a heart attack. Dr Wheeler, one of the last horse and buggy doctors in St Lawrence County, was a graduate of the College of Physicians and Surgeons, Columbia University, in the year 1902 and had practiced medicine in Norfolk and the surrounding area for the last forty-five years He was a member of the American Medical Association and the New York State and St Lawrence County Medical Societies

Frank Fay Williams, M.D , ninety-one-year-old dean of St Lawrence County physicians, was killed in an automobile collision on March 13 Dr Williams was graduated from New York Homeopathic College in 1883 and took up practice in Canton the following year He had maintained this practice for the past sixty-five years and during that time had also served as health officer Dr Williams was a member of the American Medical Association and the New York State and St Lawrence County Medical Societies at the time of his death

Arthur C Woggon, M D , fifty-three, of Rochester, died on March 16 Dr Woggon, alumnus of the University of Buffalo, School of Medicine, class of 1920, and Sloane Maternity Hospital, was chief of the Department of Obstetrics at Park Avenue Hospital, Rochester, senior obstetrician at Rochester General Hospital, and an associate physician in the Department of Obstetrics and Gynecology at Strong Memorial Hospital He was a diplomate of the American Board of Obstetrics and Gynecology and a member of the Rochester Academy of Medicine, the Rochester Pathological Society, the Alumni Association of Sloane Maternity Hospital, the New York State and Monroe County Medical Societies, and the American Medical Association

CORRESPONDENCE

A BRITISH DOCTOR SPEAKS

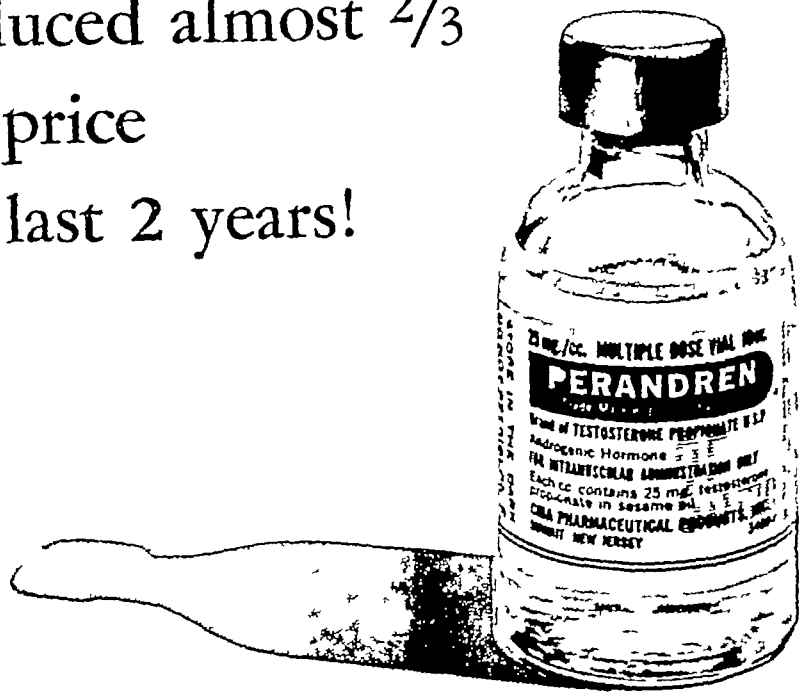
To the Secretary, Medical Society of the State of New York

My sister on Long Island tells me it is to you I should write for information re practice in New York. The position is this

I qualified at home in Ireland at the National University As you know, our degrees on graduation are M B , Ch B , B A.O The M.D is regarded as a higher degree As regards practice One could not make cigarette money in Ireland Were it not for the war, practice in England would have been full and fruitful However, after four years of practice here I have had enough With the advent of socialized medicine, state controlled, the last vestige of freedom was taken from us Medicine here is now pure mockery of the art and science mass produced medicine, bottles of placebos, 50 or 60 people per surgery session I forecast that, in a few years, the doctors here will be in a state o stagnation

Anyway, I would very much like to settle in Nev York and practice there The point is would my qualification be recognized I have heard tha machinery is in motion now to permit degrees o this country to be recognized in the U S A. and vic versa

Can you advise me on what to do I could no afford at this stage of my life to spend a couple o years taking American degrees If you can help me in any way, I should be very grateful



Kindest regards and all the best for 1949

JOHN T LAING

7 Confton Rd
Ealing, London W-5

Perandren

reduced almost 2/3 in price in last 2 years!

Perandren is the pioneer brand of testosterone propionate, the most potent androgen available

Due to increasingly wide use of this injectable male sex hormone, larger volume of production, and improved manufacturing methods, its cost has been progressively reduced until today it is only about ⅓ of the cost 2 years ago Now androgen therapy can be employed for a larger group of patients

PERANDREN Multiple dose vials of 10 cc 10 25 or 50 mg
Ampuls of 1 cc containing 5, 10 or 25 mg Cartons of 3 6 or 50

The most effective injectable derivatives of the naturally occurring estrogen

OVOCYLIN DIPROPIONATE

(α-estradiol dipropionate) formerly DI-OVOCYLIN

OVOCYLIN BENZOATE

(α-estradiol benzoate) formerly BEN-OVOCYLIN

These steroid forms of female sex hormones are the only brands of estradiol dipropionate and estradiol benzoate now bearing the seal of approval of the Council on Pharmacy and Chemistry

N N R terms α-estradiol, a natural follicular hormone of the ovary, "probably the most potent of all known naturally occurring estrogens"

Ovocylin Dipropionate and Ovocylin Benzoate are simple esters of α-estradiol in injectable form, with the advantage of being absorbed slowly Of the two forms, Ovocylin Dipropionate is the longer acting

For further data on estrogen therapy, write Medical Service Division

ere's what throat specialists reported about Camel Mildness-

In a recent coast-to-coast test, hundreds of men and women smoked Camels—and only Camels—for 30 consecutive days They smoked on the average of one to two packs a day Each week throat specialists examined the throats of these smokers, a total of 2470 careful examinations, and reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION due to smoking CAMELS"

Money-Back Guarantee!

Try Camels and test them as you smoke them. If, at any time, you are not convinced that Camels are the mildest cigarette you've ever smoked, return the package with the unused Camels and we will refund its full purchase price, plus postage. NITRANITOL

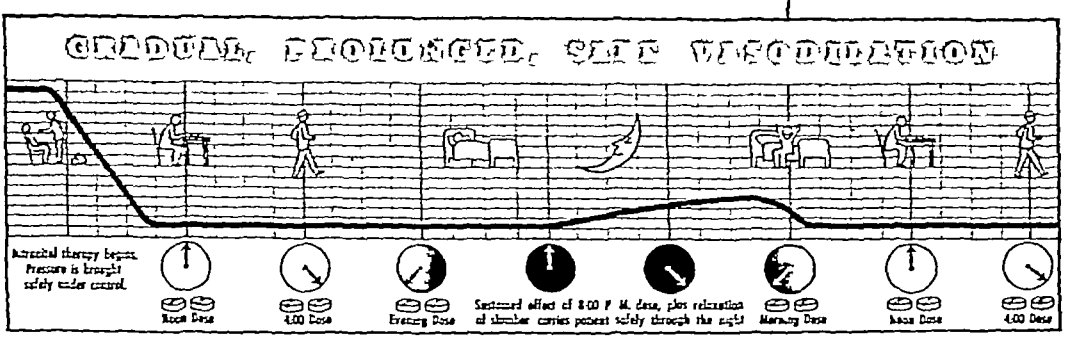
Trademark Reg. U S Pat Off

The psychogenic factors which so often contribute to hypertension are usually aggravated by the restrictions which the disease itself places on the patients activities The result is a *vicious circle* that forces pressures to higher levels and renders management increasingly difficult

Nitranitol *reverses* the vicious circle because its prolonged action permits maintenance of blood pressure at levels where a reasonable degree of useful and pleasant activity is possible With an improved psychic attitude the patients physiologic response to the medication is correspondingly better The negligible clinical toxicity of Nitranitol permits continued use of the drug for an indefinite period

Nitranitol contains ½ gr mannitol hexanitrate in each scored tablet. Average dosage 1 to 2 tablets every 4 hours At hospital and prescription pharmacies in 100 s and 1000 s



When sedation is desired in addition to vasodilation—

NITRANITOL
WITH PHENOBARBITAL

—combines ¼ gr phenobarbital with ½ gr mannitol hexanitrate Scored tablets in 100 s and 1000 s.

THE ARLINGTON CHEMICAL COMPANY, YONKERS 1, NEW YORK

Chloral hydrate, used in medicine since 1869, is, even today, "the standard hypnotic of its class"[1]

Goodman and Gilman observe that it "is unfortunately neglected today," and that the present widespread use of the barbiturates has " caused the physician to lose sight of the fact that chloral hydrate is still one of the cheapest and most effective hypnotics"[2]

In FELLO-SED, supplementation with calcium bromide and atropine sulfate largely overcomes unwanted side-actions, enhances the sedative effect and provides valuable antispasmodic activity It is presented in palatable liquid form

[1] N.N.R., 1947 p. 398.
[2] Goodman, L. & Gilman, A., The Pharmacological Basis of Therapeutics MacMillan, 1944, pp. 177-8.

Available in 8 fluidounce bottles

Adult Dose. As a sedative. ½ to 1 teaspoonful with water, every 3 or 4 hours or as directed As a hypnotic, 1 to 2 teaspoonfuls or more with water at bedtime, or as directed

FELLO-SED

FORMULA Each fluidram (4 cc.) contains, in a palatable aromatic vehicle Chloral Hydrate, 0 5 Gm (7½ gr) Calcium Bromide, 0 5 Gm. (7½ gr) Atropine Sulfate, 0 125 mg (1/480 gr)

BILHUBER-KNOLL CORP - - ORANGE, NEW JERSEY

now

parenteral HORMONE THERAPY VIA buccal ADMINISTRATION

Schering HORMONE buccal tablets

PREPARATIONS Schering steroid hormones—PROGYNON* (Estradiol U.S.P. XIII) PROLUTON* (Progesterone U.S.P XIII) ORETON* (Testosterone Propionate U.S.P XIII) and CORTATE* (Desoxycorticosterone Acetate U.S.P XIII) prepared in tablets for buccal administration and dissolved in a

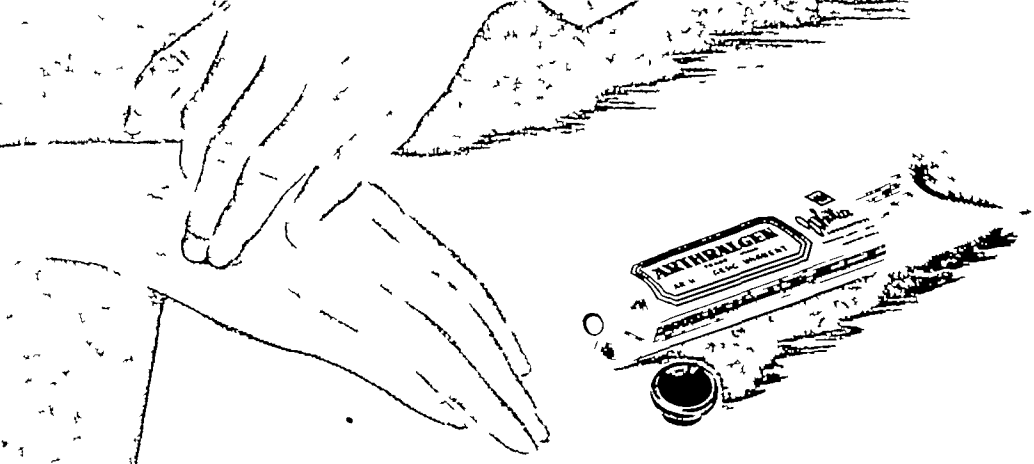
newly developed solvent, Polyhydrol†

RESULTS Weight for weight, absorption of steroid hormones in POLYHYDROL from buccal and gingival mucosae is far superior to ingestion and compares very favorably with intramuscular injection The clinical response is consequently excellent

ADVANTAGES The administration of Buccal Tablets of PROGYNON, PROLUTON, ORETON, and CORTATE is (1) convenient, since injections are avoided, (2) simple, because of the new solid solvent, and (3) economical, because of the enhanced utilization of hormone

ADMINISTRATION Buccal tablets are *not swallowed* but placed in the buccal space, between the gum and the cheek, whence they are absorbed directly into the systemic venous circulation.

RATIONALE Utilization of the systemic venous return by way of the capillaries and veins of the mouth, tongue, pharynx and upper esophagus, circumvents some hepatic inactivation which follows ingestion



PACKAGING: *bottles of 50 and 100* | PROGYNON Buccal Tablets 0.125 and 0.5 mg PROLUTON Buccal Tablets 10 mg ORETON Buccal Tablets 2.5 and 5 mg. CORTATE Buccal Tablets 2 mg.

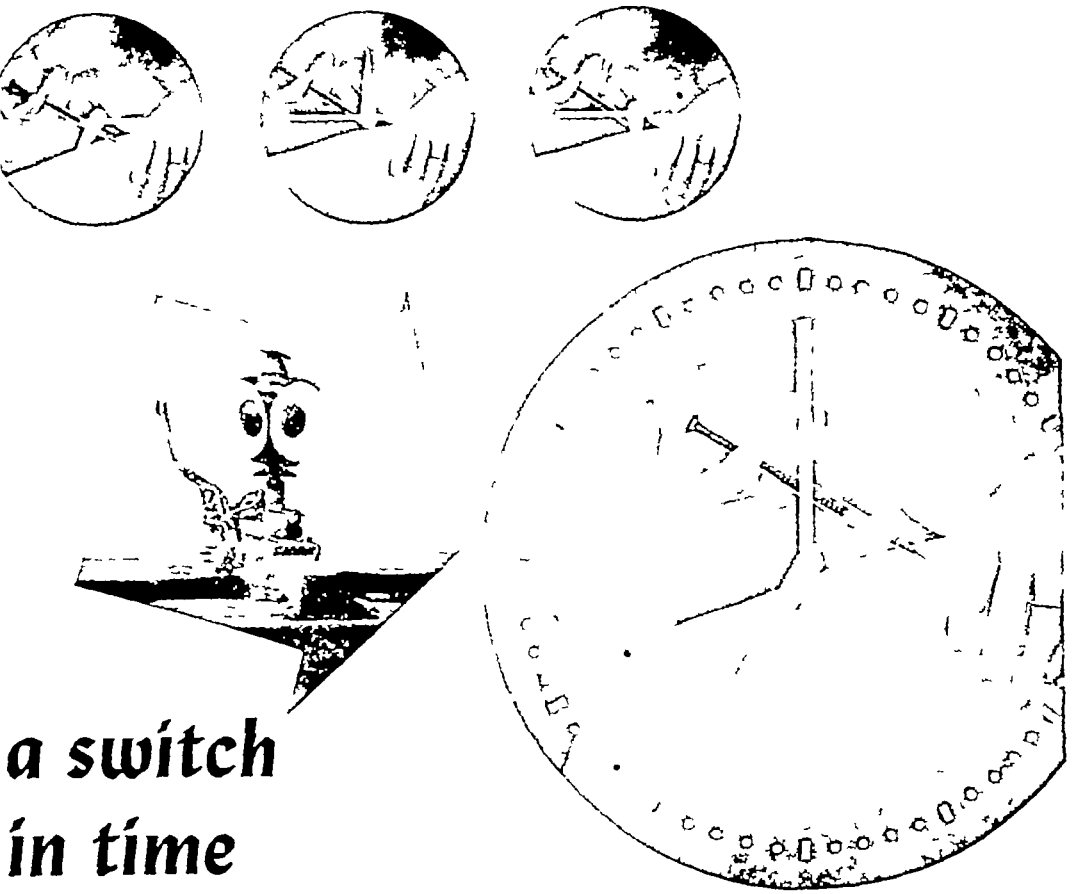
parenteral HORMONE THERAPY VIA buccal ADMINISTRATION

Percutaneous Penetration with

ARTHRALGEN™

Arthralgesic Unguent



A *single* application of Arthralgen by deep massage affords rapid and sustained relief of the pain stiffness and disability associated with articular and non articular rheumatic disorders Vasodilatation due to methacholine chloride rubefaction due to thymol and menthol analgesia due to methyl salicylate—these pharmacologic effects of Arthralgen are translated clinically into effective relief of muscle and joint pain within a few minutes of application This remarkably rapid action is favored by selected wetting agents in the ointment base which lower surface tension and assure quick and thorough penetration The hyperemia resulting from the synergistic influence of the active ingredients prolongs the duration of effect which can be further extended up to *six* hours by concomitant exposure of the affected parts to moist or dry heat

ARTHRALGEN ***is highly effective*** in fibrositis whether occurring in the fibrous insertions and aponeuroses of muscles (myositis lumbago) or in the joint capsules and bursae (synovitis bursitis) or in the supporting structures of nerves (neuritis, sciatica) It is useful also as adjunctive treatment in rheumatoid arthritis during the early phases of systemic therapy Since Arthralgen does not contain histamine it is relatively free from such untoward side effects as itching urticareal wheals or profound drop in blood pressure

Packaging: One-ounce tubes on prescription and half pound jars for office and institutional use.

Arthralgen contains methacholine chloride 0 25% thymol 1% menthol 10% and methyl salicylate 15% in a highly absorbable washable emollient base

Whittier

a switch in time

A SWITCH to 'Wellcome' Globin Insulin with Zinc can often save the annoyance of a second or third daily insulin injection—for in many cases the patient's needs can be supplied with *only one injection a day* of this unique intermediate-acting insulin Three distinct steps provide the welcomed change-over

1 THE INITIAL CHANGE-OVER DOSAGE The first day, 30 minutes or more before breakfast, give a single dose of Globin Insulin, equal to ½ the total previous daily dose of protamine zinc insulin or of protamine zinc insulin combined with regular insulin The next day dose may be increased to ⅔ former total

2 ADJUSTMENT TO 24-HOUR CONTROL Gradually adjust the Globin Insulin dosage to provide 24-hour control as evidenced by a fasting blood sugar level of less than 150 mgm or sugar-free urine in the fasting sample

3 ADJUSTMENT OF DIET: Simultaneously adjust carbohydrate distribution of diet to balance insulin activity, initially 2/10, 4/10 and 4/10 Any midafternoon hypoglycemia may usually be offset by 10 to 20 grams carbohydrate at 3 to 4 p m Base final carbohydrate adjustment on fractional urinalyses

Most mild and many moderately severe cases may be controlled by *one daily injection of Wellcome' Globin Insulin with Zinc* Vials of 10 cc , 40 and 80 units per cc Developed in The Wellcome Research Laboratories Tuckahoe, New York U S Pat 2 161,198 Literature on request

Your acne patient

cooperates

when you prescribe Acnomel...

Because ACNOMEL is delicately flesh tinted It effectively masks the blemishes and blotches of acne—yet is virtually invisible after application

ACNOMEL ordinarily brings definite improvement —not in months or weeks, but in a matter of days

Thus, the use of ACNOMEL changes the acne patient's typically defeatist attitude toward treatment Encouraged, he will faithfully follow the regimen you prescribe and apply ACNOMEL regularly, as you direct

Available, on prescription only, in specially lined 1½ oz. tubes, Resorcinol 2% sulfur 8% in a stable grease-free flesh tinted vehicle.

NEW *and important*

in peptic ulcer therapy

RESMICON™ the combination of ion exchange polyamine *resin* and gastric *mucin*, is a new and significant advance in ulcer therapy Unlike the host of ordinary "antacids," Resmicon utilizes new principles for the relief of pain and control of damage in peptic ulcer

RESMICON furnishes a non toxic, non absorbable ion exchange polymer, or *resin*, which does not "neutralize" or "buffer hydrochloric acid, but simply takes it out of action At the same time it inactivates pepsin Pain and distress are thereby rapidly controlled There are no side actions

RESMICON furnishes gastric *mucin* for protection of the eroded area by forming a dense, tenacious coating over the gastric mucosa Long clinical experience has pointed to the indispensability of mucin's natural protective barrier action But its full potentiality has hitherto been unrealized because of lack of simultaneous control of gastric acidity and pepsin

RESMICON

SMICON tablets relieve ulcer pain within 5 to 10 minutes Relief is usu-
ily complete and prolonged Side actions usual with "neutralizing" antacids
ebound hyperacidity, constipation) are absent Resmicon — an out-
anding approach to ulcer therapy — is new and important

SMICON *tablets contain 170 mg specially prepared gastric mucin*
ind 500 mg anion exchange polyamine polymer resin Typical dosage
n hyperacidity *Chew thoroughly* 1 tablet every 3 or 4 hours or as nec-
ssary in peptic ulcer (acute phase) *Chew thoroughly* 1 or 2 tablets
very 1 *or* 2 *hours and* 2 *to* 4 *hours prior to bedtime No fluids should*
e taken for a period of one-half hour following administration
Antispasmodics may be administered concurrently Proper dietary
precautions should be observed or (for routine management) 1 or
2 tablets every 2 or 3 hours and after meals

Supplied in bottles of 84 tablets

STATISTICALLY SIGNIFICANT

Recent important investigations confirm superiority of molybdenized ferrous sulfate in iron-deficiency anemia.

Dieckmann, W. J , and Priddle, H D Anemia of Pregnancy Treated with Molybdenum-Iron Complex, Amer J Obstet & Gynecol , (March) 1949.

Dieckmann and associates recently undertook an evaluation of molybdenized ferrous sulfate (Mol-Iron) in anemia of pregnancy—a relatively resistant type of anemia

A carefully selected group of patients was given Mol-Iron in a dosage 2 tablets 3 times daily, a compale group of patients who received o iron medication served as controls

FINDINGS: "The patients who were treated showed a rapid increase in hemoglobin and hematocrit with a mean at term of 11 8 Gm per 100 ml and 36 volumes per cent—high figures for pregnant patients The mean for the present control group is 10 7 Gm of hemoglobin per 100 ml and a hematocrit of 32 6 volumes per cent (at term) At six weeks post partum, the patients who had been on molybdenum-iron had a mean of 12 2 Gm per 100 ml as compared with 11 2 for the present (control) group "

COMMENT: "We have never had other iron salts so efficacious in pregnant patients Our results with the molybdenum-iron complex have been so striking that, if the patient has taken this medication for three weeks and shown no significant increase in the hemoglobin concentration, the therapy is stopped and a more extensive study (bone marrow biopsy, gastric analysis, reticulocyte count, etc) made to determine the cause of the anemia "

SUMMARY: "We believe that the value of this molybdenum-iron complex has been demonstrated as being very effective in increasing the hemoglobin of pregnant patients who are anemic "

ADVANCE IN ANEMIA THERAPY

Talso, P J Anemia in Pregnancy, J Ins Med, 4 31-34 (Dec-Jan-Feb) 1948-1949

"The encouraging results obtained with molybdenumized ferrous sulfate in the microcytic hypochromic group indicate a better prognosis in these conditions in the future with a resultant improvement in maternal health generally"

Chesley, R F, and Annitto, J E Evaluation of Molybdenized Ferrous Sulfate in the Treatment of Hypochromic Anemia of Pregnancy, Bull Margaret Hague Maternity Hospital, 1 68-75 (Sept) 1948

"... molybdenized ferrous sulfate produced a substantially more rapid therapeutic response than ferrous sulfate, the difference in response being statistically significant Addition to ferrous sulfate of either liver-stomach extract or folic acid did not potentiate the action of the iron salt

"None of the patients treated with molybdenized ferrous sulfate complained of more than mild digestive symptoms related to the medication However, 8 per cent of the patients originally selected for treatment with ferrous sulfate had to be withdrawn from the study because of consequent digestive up-sets"

White's Mol-iron Tablets, Liquid

MOLYBDENIZED FERROUS SULFATE

a specially processed, co precipitated, stable complex of molybdenum oxide 3 mg (1/20 gr) and ferrous sulfate 195 mg (3 gr) In bottles of 100 and 1000 Tablets Also available in a highly palatable Liquid, in bottles of 12 fluid-ounces

WHITE LABORATORIES, Inc, Pharmaceutical Manufacturers, Newark 7, N J.

AN IMPORTANT NEW MILESTONE

in the Therapy of Arthritic Affections..

The "cure of [rheumatic fever]", agree most authoritative sources,[2,3,5,6] "depends not only on reaching, but also on maintaining a high plasma salicylate level"[3] The correlation between such blood levels and symptomatic improvement is graphically shown in the table at the right[6]

Pabalate—latest product of Robins' research —now helps to achieve and maintain *higher salicylate blood levels on lower salicylate dosage*

This is made possible by the combination in Pabalate of non-toxic para-aminobenzoic acid with sodium salicylate As visualized in the chart at the lower right,[4] para-aminobenzoic acid (itself an active antirheumatic)[7] manifests a reciprocal action with salicylates when administered concurrently—sharply increasing the blood salicylate levels (under constant salicylate dosage),[1,4] and in turn having its own blood levels effectively enhanced[4]

The clinical significance of this synergistic relationship represents an important advantage in the therapy of arthritic affections Pabalate 'Robins'—a strictly ethical preparation— is available at (or may be secured by) all leading pharmacies

Salicylate blood level (in mg. per 100 cc.)	Erythrocyte sedimentation
less than 20 mg.	no fall
20-30 mg.	slow fall
30-40 mg	RETURN TO NOR CLINICAL SYMP SUBSIDE

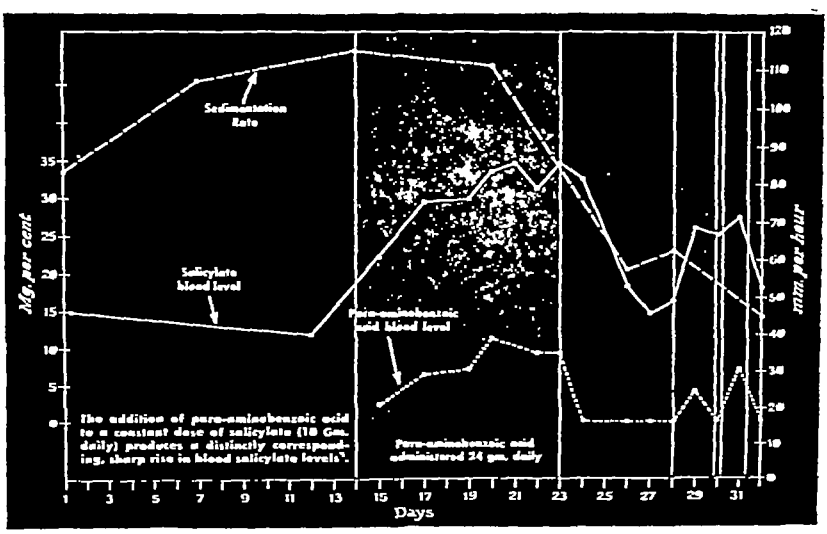
A. H ROBINS CO, INC., RICHMOND 20, VA.
Ethical Pharmaceuticals of Merit since 1878

indications Rheumatoid arthritis, acute rheumatic fever, fibrositis, gout, osteo-arthritis

dosage Two or three enteric coated tablets every three or four hours, without sodium bicarbonate

formula Each enteric coated tablet contains Sodium salicylate, U S P (5 gr), 0.3 Gm , Para aminobenzoic acid (as sodium salt), (5 gr), 0 3 Gm

supplied In bottles of 100 and 500 enteric coated tablets.



For high salicylate blood levels on low salicylate dosage—

Pabalate®

Pabalate tablets are enteric coated to prevent gastric irritation and insure optimal toleration

The ever-moving frontier

Research on vitamin knowledge in the field of nutrition has come a long way since the early published researches of McCollum, Mendel and Funk. The science of nutrition is no longer the stepchild of medicine, nor the poor relation of agriculture. In particular, our understanding of the need for vitamins in human nutrition has enormously increased. Vitamins constitute in the aggregate the *sine qua non* for cellular respiration, reproduction, growth and repair.

For the past 25 years, biochemists have pressed forward a continually moving frontier of scientific discovery in the field of nutrition. In recent years, *Lederle* has been in the vanguard of this movement, its investigators being well known for their achievements with folic acid, pyridoxine, biotin, the pantothenates, liver extract, and allied substances. There will be no slackening in the efforts of this organization to uncover additional aids to better health and better living.

To re-establish emotional equilibrium

'Benzebar' combines the effective anti depressant action of Benzedrine* Sulfate and the mild sedation of phenobarbital

The 'Benzedrine' Sulfate in 'Benzebar' restores optimism, cheerfulness and sense of well being, increases mental activity and interest in life, imparts a feeling of energy and alertness

Simultaneously, the phenobarbital component calms nervous excitability and agitation, relieves anxiety and tension

Thus, 'Benzebar' is valuable in the symptomatic treatment of the depressed patient who displays anxiety or agitation

Benzebar

a logical combination of 'Benzedrine' Sulfate (5 mg) and phenobarbital (¼ gr)

A REVIEW OF RECENT PUBLICATIONS OF CLINICAL INTEREST·

I

Recently published data concerning the lipotropic action of inositol in both experimental animals and human subjects, and the broad clinical implications of these findings, prompt this series to keep the physician informed on this important subject As the results of further clinical studies are published, the findings will be presented This member of the vitamin B complex appears to possess significant therapeutic potentialities, and intensive research is being conducted in many quarters to establish indications for its use

In a study of various lipotropic agents administered to 111 patients with atheromatous disease it was observed that inositol resulted in an average reduction of blood cholesterol and cholesterol esters of 19 per cent and 17 per cent respectively The patients with hypercholesterolemia manifested this drop in blood cholesterols in a period of 6 to 10 weeks The same individuals showed clinical evidence of atheromatous coronary artery disease The author points out that lipotropic agents in general "warrant further study as promising therapeutic agents "[1]

Inositol was administered to a 37 year old patient with generalized xanthomatous cutaneous lesions Collateral therapy consisted of a low fat, low cholesterol, high protein, high carbohydrate diet, and administration of choline and methionine Inositol alone or inositol and diet markedly reduced total blood lipids and also phospholipids, but cholesterol esters and total cholesterol remained high Despite these objective changes and symptomatic improvement of the patient the author warns that lipotropic activity can be properly evaluated only after prolonged study [2]

Goldstein and Rosahn have successfully employed inositol combined with choline in the treatment of patients suffering from cirrhosis of the liver in an advanced stage [3] More recently, Broun[4] reported complete recovery of a patient with advanced hepatic cirrhosis, who received daily doses of 1 0 Gm inositol, 1 Gm choline, and 2 tablets of fortified yeast Previous attempts to control ascites with choline and liver extract therapy had failed The dietary regimen was kept unchanged

INOSITOL-C S C

Inositol-C S C is supplied in 0 5 Gm capsules in bottles of 100

In treating Para-nasal Infections with

ARGYROL there is no rebound action to complicate end results

The desirable goal of treatment is the restoration of normal nasal function, an impossible achievement when the use of vasoconstrictors induces rebound congestion or Rhinitis Medicamentosa

ARGYROL not only has proven effectiveness in restoring normal function, but its use wholly avoids such undesirable side reactions

The ARGYROL Technique

1. The nasal meatus by 20 per cent ARGYROL instillations through the naso-lacrimal duct.
2. The nasal passages with 10 per cent ARGYPOL solution in drops
3. The nasal cavities with 10 per cent ARGYPOL by nasal tamponage

Its Three-Fold Effect

1. Decongests without irritation to the membrane and without ciliary injury
2. Definitely bacteriostatic yet non toxic to tissue
3. Stimulates secretion and cleanses thereby enhancing Nature's own first line of defense

ARGYROL — *the medication of choice in treating para-nasal infection*

an entirely new approach to the treatment of pain

The intensity of pain is determined, in no small degree, by the patient's mood It follows that any measure which will lessen your patient's preoccupation with his pain will actually make him feel his pain less

EDRISAL contains two analgesics of established effectiveness But, just as important, it also contains the logical anti-depressant, Benzedrine* Sulfate Thus Edrisal not only relieves your patient's organic pain, but also relieves his anxiety over it In Edrisal, therefore, you have a unique weapon—a double-barreled weapon—for the relief of pain

Each Edrisal tablet contains acetylsalicylic acid (2 5 gr), phenacetin (2 5 gr), and *Benzedrine Sulfate (2 5 mg) For samples and full information, write us at 429 Arch St , Philadelphia 5, Pa

MEAT...
and Physical Rehabilitation

Any marked loss of weight in the nonobese patient deprives the organism of a considerable amount of protein, apt to lead to severe protein deficiency A weight loss of 5 Kg does not appear large as such Yet it is estimated that it may well entail a simultaneous loss of as much as 900 Gm —or two pounds—of tissue protein,* taken from the scant protein stores of the body, from the muscles, liver and other viscera Prevention of such large protein losses or rapid replacement of depleted protein stores is imperative Nitrogen balance must be re-established as quickly as possible to promote local healing and general recovery in many surgical conditions, in severe burns, in metabolic disturbances, and following overwhelming infections

Meat as the primary source of protein affords a number of special advantages in the period of actual dietotherapy as well as during recovery and rehabilitation It is of excellent digestibility so that it can be easily eaten two or three times a day to satisfy increased protein requirements

The appetizing taste appeal encourages simultaneous intake of other valuable foods, especially desirable in the presence of anorexia

All meat is notably rich in biologically complete protein, from 15 to 20 per cent of its uncooked and from 25 to 30 per cent of its cooked weight Furthermore, meat ranks with the best sources of B-complex vitamins and iron, important nutrient factors in physical rehabilitation

BEGINNING A GREAT EXPERIENCE

Thanks to prenatal care, better nutrition, and the knowledge and skill of the physicians engaged in obstetrical practice, maternal mortality and morbidity continue to decline

Products of medical research have helped to solve some of the obstetrician's problems For prenatal care, the vitamins, calcium, well-tolerated iron salts, and preparations of liver extract have been found useful Administration of the shorter-acting barbiturates during labor has made the experience less trying for the mother, with little danger of damaging effect upon the infant Postpartum care has been simplified with ergonovine maleate These are but a few of the contributions of research scientists to maternal and infant welfare At the Lilly Research Laboratories, work goes on apace to improve existing products and to seek answers to the problems yet unsolved That improvements will come seems a certainty, and when they do, you, the physician, will be the first to be informed

Medical Officers Needed

The need of the armed services for medical officers is great Secretary Forrestal, in a press conference on February 25, 1949, issued an urgent appeal for 2,200 physicians for replacements during the remainder of this year

The A M A 's Council on Emergency Medical Service has provided each state medical association with a list of all physicians under 26 years of age in that state, so that an urgent personal appeal may be made to every doctor who has not fulfilled his moral obligation to serve Says the *J A M A*

> The 8,000 physicians who were deferred from active military duty during World War II and trained in whole or in part at the expense of the government have a strong moral obligation to give one to two years to the government, replacing those who have already served patriotically for two years The American medical profession voluntarily provided over 50,000 physicians to the Army and Navy during World War II It cannot fail now to supply the demand for medical service created by the unsettled world condition Soon the ultimate choice will be made service on a voluntary basis or by compulsion [1]

The Empire State has a notable record both in the number and caliber of the physicians who have in the past and are now caring for the medical needs of the armed services It is to be devoutly hoped that this fine ideal will continue to be upheld That it will not be is to us unthinkable and out of the question To enjoy the privileges of the finest medical education provided any place in the world implies the obligation to help maintain those privileges Our young doctors know that and, we are certain, realize the fact that only by the voluntary fulfillment of those obligations can American standards and ideals be maintained and raised ever higher

Apply now for your commission as a medical officer in the armed forces of the United States, no one else can do it for you (*See special article, page 1077*)

[1] J.A.M.A. 139 650 (Mar 5) 1949

Radio Forums on National Health Insurance

The more we listen to radio forums on which the question of national compulsory health insurance is discussed pro and con, the more we are impressed by the earnestness and obvious sincerity of the protagonists and antagonists The antagonists, mostly doctors, leave their offices, hospitals or clinics, where they are normally busily occupied in producing the excellent medical service this country now enjoys, to become pleaders—special pleaders if you will—to the Congress of this Republic not to wreck an existing structure which they know works Not one doctor has claimed that it works perfectly, but all realize that it has evolved slowly and surely and that such parts of it as need improvement can be and are being perfected as rapidly as consistent with safety

Certain legislators are inclined to agree with the doctors, not because they like doctors but because they seem to respect expert opinion on medical service These legislators thus become antagonists to proposals for the imposition by law of a system of public, tax-supported and therefore government-controlled medical service They, as lawmakers, seem to appreciate with the A M A the vital truth that today "the real problem in most American homes is the tax bill, not the medical bill"

> The assertion was made in behalf of the A M A in a statement by Dr R B Robins of Camden, Arkansas, a member of the Association's house of delegates and Democratic national committeeman from Arkansas He declared
>
> "In most income classes, according to the findings of the Brookings Institution, the cost of medical care represents about 4 or 4 5 per cent of family income But the tax bill is draining away 20 to 30 per cent of earnings, even in the low and middle income groups"[1]

With equal earnestness and sincerity, proponents of national health insurance with fiery zeal proclaim its merits Mr Ewing, at Town Hall in New York on February 22, eulogized the insurance principle of spreading costs and did so with sincere conviction, using fire insurance as an example The fact that fire insurance is not health insurance, has never been compulsory nor a function of government, nor paid for by wage or salary deductions from workers' pay apparently did not in the least deter him from using the example as a compelling argument for national health insurance Other proponents, no less zealous for the blessings of the welfare state, bristle with statistically sticky proof of this and that Hospital beds, percentages, billions of dollars, construction, millions of insured, preventive medicine, benefits, fire insurance, and pay deductions roll furiously about from platforms and loudspeakers

Most of the doctors of the nation, sincere in their desire to have the public informed about the really good medical service they enjoy, have gladly contributed their twenty five dollars, assessed by the American Medical Association, in the sure conviction that the common sense of the informed man on the street will prevail The question at issue is too vital and serious to be rushed to a quick decision Radio forums of one hour or less do not permit more than fractional discussion of a subject

Radio forums should be supplemented by well documented literature widely disseminated This should reach all service clubs, women's organizations, chambers of commerce, farm bureaus, and veterans posts with their women's auxiliaries, all over the country Radio forums leave much to be desired Usually they tend to cover too much ground by too many speakers in too little time Listeners are confronted by the sound equivalent of a three- or four-ring circus By ear alone and auditory memory they are unable to retain for long the continuity of thought voiced by the speakers, especially those who enunciate rapidly and interlard their argument with statistical data Too often the listener at the conclusion of the hour agrees with Omar Khayyám who, of record, when young "did eagerly frequent doctor and Saint, and heard great argument about it and about, and evermore came out by that same door wherein I went"

We cannot urge too strongly full resort by the A M A to short, concise reference material, plainly printed and factual, and a bare minimum of radio forums

[1] New York Times February 23, 1949

The President's Page

The honor of having been your main servant during the past year has been a glorious privilege for me I have enjoyed helping to keep this great ship of the Medical Society of the State of New York on her course of important usefulness

During the past year we have heard ever-increasing threats against our treasured privileges These privileges have always been a part of our great profession—of being self-governed, self-disciplined, of maintaining high ideals, of ever seeking higher standards of medical service, of being servants to no one, except to our patients

The medical mother of us all, the A M A , realizing that this threat was of deadly intent, sent out a call to her children to rally, to give funds, to put aside from our daily work time and effort for the cause—and what is that cause? To protect our patients, the ultimate objective of our solicitude, from inferior care, and to preserve our independence

Never before has the A M A seen fit to call on us She has in the past spent herself in ever improving the doctor and his standards Her initial efforts and subsequent constant watchfulness have transformed medical education She has protected the public against quack remedies and quack doctors She has scrutinized and demanded therapeutic quality in new remedies She has published the greatest medical journal in the world, many special scientific journals, and the popular *Hygeia* She has made the medical literature of the world accessible and available She has published, and kept up to date by new editions, a great medical directory These activities of the A M A have been going on year after year and have been taken for granted by her children, just as children take for granted the indispensable work done by their mother in maintaining the home

The doctors, meanwhile, as a result of their better and often specialized education, have become increasingly busy, have formed many new scientific associations which take of their interest and allegiance, so that in recent years we have had a flood of meetings of special groups That is as it should be They are invaluable These various special meetings furnish a fine scientific nourishment, but they are not constituted to furnish anything else

Doctors of our generation have lived in an age of great economic tranquillity, as far as they are concerned We have had prestige, honor, respect, and adequate prosperity There is now, however, considerable evidence that this honor and respect are waning in this country We are beginning to realize, some of us more quickly than others, that this movement is not against us as individuals, but as a profession Irrespective of the motives behind this movement, and dismaying as it might be to our ego, nevertheless all a priori reasoning falls down before a fact The movement is on

We cannot refuse to give battle when the welfare of our patients is at stake, where our privileges and independence are at stake, and when the future of our country itself may be at stake We can best wage war when we properly marshall our forces We must have a high command, good officers, and foot soldiers full of fight and fervor Our high command is the A M A., its officers and councils (Our special societies, try as they may, are not able to do the work) Our officers are the leaders of the county and state societies, while the foot soldiers are all the doctors in the United states

It will avail not at all if we map out a great campaign, and we, the foot soldiers, decide to take a vacation from fighting Wars are won by the determination and bravery of foot soldiers I have no fear We will win this war American medicine will continue to be the glory of the world, and ever climb the stairs that lead to perfection

Leo F Simpson

ADVANCES IN PHYSICAL MEDICINE

From the Department of Rehabilitation and Physical Medicine
New York University College of Medicine
Howard A Rusk, M D , Director

Rehabilitation of the Hemiplegic

Hemiplegia following apoplexy is one of the most common of the chronic neurologic disabilities The most common general symptom of apoplexy is disturbance of consciousness The most common focal sign of apoplexy is hemiplegia or paralysis The most frequent cases of apoplexy are thrombosis, hemorrhage, and embolism Active rehabilitation in apoplexy resulting from thrombosis may begin as soon as the patient regains consciousness In hemiplegia resulting from hemorrhage, rehabilitation should be limited to bed activities for the first three weeks In hemiplegia resulting from embolism, active rehabilitation may begin as soon as the patient regains consciousness, if there are no other systemic contraindications In the selection of hemiplegic cases for rehabilitation, exclude those in which the rehabilitation cannot keep up with the pathologic processes, as in malignant hypertension, encephalomalacia, and cardiac insufficiency

In the early stages of treatment, the following procedures should be instituted to prevent deformities (1) Footboard or posterior leg splint to prevent footdrop, (2) sandbags to prevent outward rotation of the affected leg, (3) a pillow in the axilla to prevent adduction of the shoulder, and (4) quadriceps setting to maintain muscle strength All of these procedures are relatively simple and require no special equipment Their use, however, will prevent crippling anatomic deformities and hasten the rehabilitation of the patient

The next procedure indicated is the institution of pulley therapy This can be done very simply with a small pulley attached to a gooseneck pipe over the head of the bed, using the ordinary clothes line rope with a one-inch webbing for the hand loop With the stretching and passive exercise provided by pulley therapy, the range of motion of the shoulder and elbow can be increased and adhesions prevented

Pulley therapy has the advantage over the usual stretching exercises that are done passively, for the patient, knowing his own pain threshold, will proceed to fully tolerated motion much more quickly Pulley therapy can also be used to aid in the re-establishment of reciprocal motion patterns

The patient, at this stage, should be encouraged to sit erect in order to re-establish balance Speech therapy, if indicated, should be instituted In the absence of a trained speech therapist, the speech re-education can be started under medical supervision by any teacher who has had some experience in this field In the aphasic, it is well for the physician to point out to the patient and family the nature of the condition in order that the inability to use the tools of language may not be interpreted as loss or diminishing of the ability to think and reason

The next progressive stage in retraining is ambulation, which should be started by (1) The practice of balance in the standing position progressing to parallel bars, (2) the teaching of a heel and toe gait, stressing reciprocal motion to minimize clonus and to re-establish normal walking habits, and (3) a short leg brace needed in approximately half of all cases to correct foot drop All of the equipment for training in ambulation is simple and readily obtained by the general practitioner If parallel bars are not available, two kitchen chairs may be substituted

In the advanced stages of retraining, ambulation is continued with (1) Instruction in crutch walking, starting usually with the alternate four-point gait, and (2) teaching elevation, stressing climbing steps, curbs, stairs, and ramps Concurrently with training in ambulation, attention should be given to retraining in the activities of self-care and daily living

Obviously, the physician himself cannot undertake the actual administration of the retraining, but the therapist, nurse, volunteer, or even a member of the family can conduct the activities under his supervision With such a program, many of the complications usually following apoplexy can be avoided, and a great deal of time and ability salvaged

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Parenteral Nutrition, VI—Energy and Vitamin Needs

The basal energy needs of the body are met by a daily intake of 1,500 calories Patients with fever require proportionately more calories to offset the increase in metabolic rate caused by a rise in body temperature Although this daily caloric requirement can be met with parenteral glucose and protein hydrolysates for short periods, it remains difficult to maintain adequate parenteral nutrition over long periods of time The fact that fat is not yet available for parenteral feeding deprives us of a high calorie parenteral diet We must not lose sight of the fact that there is a limit to the amount of glucose and protein hydrolysates which can be given patients, without causing undue nervous fatigue from long hours of infusion or producing glycosuria and diuresis from too rapid administration Woodyatt *et al* in 1915 established a ceiling rate of injection for glucose at 0 8 Gm per kg per hour for normal people Above that rate glycosuria and diuresis occurred [1] Sansum and Wilder two years later reported that the rate of injection should be lower with patients with hyperthyroidism, chronic pancreatitis, mild diabetes, acromegaly, and diabetes insipidus, because glucose tolerance is reduced in these conditions [2] There has been suspicion that a similar decreased tolerance for sugar is present in postoperative patients [3 4] Recently, Lockhart and Elman have shown that normal people cannot metabolize glucose without glycosuria appearing when injection rates exceed 0 5 Gm per kg per hour, a rate considerably lower than the one advocated by Woodyatt They observed that the utilization of glucose increased when protein hydrolysates were added to the parenteral glucose solution The need for a high calorie parenteral solution is emphasized by these findings, because with the newly advocated rates of injection, 1 liter of 5 per cent glucose requires in the average individual (70 kg) 1 hour and 25 minutes for injection, for 1 liter of a 10 per cent solution 2 hours and 50 minutes is required Even though the total excretion of glucose in the urine was found to be low at faster rates, substantial diuresis did occur Where diuresis is indicated, rates of injection which produce glycosuria are justified Protein hydrolysate solutions should be given slowly to avoid uncomfortable side reactions

Stare *et al* have recently reported the successful use of a fat emulsion in dogs [5] Nitrogen balance and normal growth indicated utilization of a fat emulsion up to 30 per cent of the total energy requirements in growing puppies Histologic examination revealed no fat retention following long term administration of this emulsion parenterally A normocytic anemia developed, however—and a slight increase in free cholesterol and a corresponding decrease in ester cholesterol were noted in the plasma and liver Both the anemia and the cholesterol metabolic changes appear to have resulted from the phosphatide stabilizer and not from the fat We are witnessing a rapid development of the fat component of the parenteral diet It seems assured for general use in the near future

If the parenteral diet is of short duration, vitamins are not essential unless the patient was previously malnourished, in which case vitamin replacement therapy may be indicated If glucose is given parenterally for many days, addition of thiamine, niacin, and riboflavin is desirable to prevent accumulation of pyruvate In occasional cases ascorbic acid should be added to parenteral fluids in reasonable amounts Vitamin A reserves

ADVANCES IN PHYSICAL MEDICINE

From the Department of Rehabilitation and Physical Medicine
New York University College of Medicine
Howard A Rusk, M D , Director

Rehabilitation of the Hemiplegic

Hemiplegia following apoplexy is one of the most common of the chronic neurologic disabilities The most common general symptom of apoplexy is disturbance of consciousness The most common focal sign of apoplexy is hemiplegia or paralysis The most frequent cases of apoplexy are thrombosis, hemorrhage, and embolism Active rehabilitation in apoplexy resulting from thrombosis may begin as soon as the patient regains consciousness In hemiplegia resulting from hemorrhage, rehabilitation should be limited to bed activities for the first three weeks In hemiplegia resulting from embolism, active rehabilitation may begin as soon as the patient regains consciousness, if there are no other systemic contraindications In the selection of hemiplegic cases for rehabilitation, exclude those in which the rehabilitation cannot keep up with the pathologic processes, as in malignant hypertension, encephalomalacia, and cardiac insufficiency

In the early stages of treatment, the following procedures should be instituted to prevent deformities (1) Footboard or posterior leg splint to prevent footdrop, (2) sandbags to prevent outward rotation of the affected leg, (3) a pillow in the axilla to prevent adduction of the shoulder, and (4) quadriceps setting to maintain muscle strength All of these procedures are relatively simple and require no special equipment Their use, however, will prevent crippling anatomic deformities and hasten the rehabilitation of the patient

The next procedure indicated is the institution of pulley therapy This can be done very simply with a small pulley attached to a gooseneck pipe over the head of the bed, using the ordinary clothes line rope with a one-inch webbing for the hand loop With the stretching and passive exercise provided by pulley therapy, the range of motion of the shoulder and elbow can be increased and adhesions prevented

Pulley therapy has the advantage over the usual stretching exercises that are done passively, for the patient, knowing his own pain threshold, will proceed to fully tolerated motion much more quickly Pulley therapy can also be used to aid in the re-establishment of reciprocal motion patterns.

The patient, at this stage, should be encouraged to sit erect in order to re-establish balance Speech therapy, if indicated, should be instituted In the absence of a trained speech therapist, the speech re-education can be started under medical supervision by any teacher who has had some experience in this field In the aphasic, it is well for the physician to point out to the patient and family the nature of the condition in order that the inability to use the tools of language may not be interpreted as loss or diminishing of the ability to think and reason

The next progressive stage in retraining is ambulation, which should be started by (1) The practice of balance in the standing position progressing to parallel bars, (2) the teaching of a heel and toe gait, stressing reciprocal motion to minimize clonus and to re-establish normal walking habits, and (3) a short leg brace needed in approximately half of all cases to correct foot drop The of the equipment for training in ambulation is simple and readily obtained by the general practitioner If parallel bars are not available, two kitchen chairs may be substituted

In the advanced stages of retraining ambulation is continued with (1) Instruction in crutch walking, starting usually with the alternate four-point gait, and (2) teaching elevation, stressing climbing steps, curb stairs, and ramps Concurrently with training in ambulation, attention should be given to retraining in the activities of self-care and daily living

Obviously, the physician himself cannot undertake the actual administration of the retraining, but the therapist, nurse, volunteer, or even a member of the family can conduct the activities under his supervision With such a program, many of the complications usually following apoplexy can be avoided, and a great deal of time and ability salvaged

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca

Parenteral Nutrition, VI—Energy and Vitamin Needs

The basal energy needs of the body are met by a daily intake of 1,500 calories Patients with fever require proportionately more calories to offset the increase in metabolic rate caused by a rise in body temperature Although this daily caloric requirement can be met with parenteral glucose and protein hydrolysates for short periods, it remains difficult to maintain adequate parenteral nutrition over long periods of time The fact that fat is not yet available for parenteral feeding deprives us of a high calorie parenteral diet We must not lose sight of the fact that there is a limit to the amount of glucose and protein hydrolysates which can be given patients, without causing undue nervous fatigue from long hours of infusion or producing glycosuria and diuresis from too rapid administration Woodyatt *et al* in 1915 established a ceiling rate of injection for glucose at 0 8 Gm per kg per hour for normal people Above that rate glycosuria and diuresis occurred [1] Sansum and Wilder two years later reported that the rate of injection should be lower with patients with hyperthyroidism, chronic pancreatitis, mild diabetes, acromegaly, and diabetes insipidus, because glucose tolerance is reduced in these conditions [2] There has been suspicion that a similar decreased tolerance for sugar is present in postoperative patients [3 4] Recently, Lockhart and Elman have shown that normal people cannot metabolize glucose without glycosuria appearing when injection rates exceed 0 5 Gm per kg per hour, a rate considerably lower than the one advocated by Woodyatt They observed that the utilization of glucose increased when protein hydrolysates were added to the parenteral glucose solution The need for a high calorie parenteral solution is emphasized by these findings, because with the newly advocated rates of injection, 1 liter of 5 per cent glucose requires in the average individual (70 kg) 1 hour and 25 minutes for injection, for 1 liter of a 10 per cent solution 2 hours and 50 minutes is required Even though the total excretion of glucose in the urine was found to be low at faster rates, substantial diuresis did occur Where diuresis is indicated, rates of injection which produce glycosuria are justified Protein hydrolysate solutions should be given slowly to avoid uncomfortable side reactions

Stare *et al* have recently reported the successful use of a fat emulsion in dogs [5] Nitrogen balance and normal growth indicated utilization of a fat emulsion up to 30 per cent of the total energy requirements in growing puppies Histologic examination revealed no fat retention following long term administration of this emulsion parenterally A normocytic anemia developed, however—and a slight increase in free cholesterol and a corresponding decrease in ester cholesterol were noted in the plasma and liver Both the anemia and the cholesterol metabolic changes appear to have resulted from the phosphatide stabilizer and not from the fat We are witnessing a rapid development of the fat component of the parenteral diet It seems assured for general use in the near future

If the parenteral diet is of short duration, vitamins are not essential unless the patient was previously malnourished, in which case vitamin replacement therapy may be indicated If glucose is given parenterally for many days, addition of thiamine, niacin, and riboflavin is desirable to prevent accumulation of pyruvate In occasional cases ascorbic acid should be added to parenteral fluids in reasonable amounts Vitamin A reserves

are usually adequate to tide over a patient for some time However, when a physician is dealing with the necessity of parenteral nutrition in patients with liver disease, vitamin A and vitamin K supplements are desirable The Council on Pharmacy and Chemistry of the American Medical Association does not accept for approval mixed vitamin preparations for parenteral use Also, the Council feels parenteral vitamin nutrition is seldom indicated [6] Surely each physician should think of the expense to his patient when he orders parenteral vitamin preparations in excess of requirements Large amounts of protein hydrolysates may be prescribed, especially in patients with malignancy of the gastrointestinal tract Rhoades *et al* have demonstrated that protein stores are lowered in these patients regardless of their food intake, and following extirpation of the malignancy, protein storage is again promptly reinstated [7] The use of modified globin from human erythrocytes has been shown to quadruple the available amount of protein over plasma alone for restoration of the protein stores in debilitated people [8] In the near future this protein solution will be generally available The use of alcohol solutions for energy requirements remains a controversial question It is common practice to calculate 8 calories per cc of alcohol administered [9] Whether the patient utilizes these calories for energy within the usual definition framework of utilizable calories remains obscure However, the parenteral use of alcohol for sedation seems established

In the recent reviews on this page of parenteral nutrition some phases of the problem were discussed at length, others considered lightly, and some neglected A few factors were emphasized because of their fundamental importance The subject of parenteral nutrition is so vast and developments are so rapid that no one article or series of articles can do it justice for long An understanding of the general principles upon which parenteral alimentation is built, however, can be of assistance to physicians in making day-to-day decisions

It seems appropriate to close the present series with a quotation from William Prout, who, in a lecture in 1831 to a medical group, said "The physician of another age will be as familiar with the operations of the animal economy as he is at present with its anatomy, I have not the least doubt and—I will venture to predict that what the knowledge of anatomy at present is to the surgeon, in conducting his operations, so will chemistry be to the physician in directing him generally, what to do and what to shun, and, in short, in enabling him to wield his remedies with a certainty and precision of which in the present state of his knowledge he has not the most distant conception "[10] Modern medicine has kept the faith of this able and heroic physician who was nearly a hundred years ahead of his time in his understanding of the value of nutrition The speed with which modern science is unravelling the intricate unknowns of body mechanisms leaves one hesitant to predict to what extent physicians of tomorrow will have edification over doctors of today The editorial board plans to keep the readers of this journal abreast of both contemporary development and future expansion of parenteral nutrition technics by occasional editorial reviews of the newer knowledge in this field

NOW . . .

Hypodermoclysis at Intravenous Speed

WITHOUT ALIDASE

Swelling Pain Slow Absorption

WITH ALIDASE

Comfort Safety Rapid Absorption

The procedure of administering fluids or drugs by hypodermoclysis frequently has been handicapped by slowness of absorption, distention and trauma to tissue and pain at the site of injection. Now these difficulties can be overcome by the concomitant use of a product of Searle Research ALIDASE

Alidase offers a highly purified well-tolerated form of hyaluronidase—the specific enzyme which reduces intercellular resistance by hydrolyzing the tissue cement (hyaluronic acid) [1]

RAPID ABSORPTION—Research has shown [2,3] that the simultaneous use of the enzyme increases the rate of fluid absorption *twelvefold*

SAFETY— There is little effect on the blood pressure and on the respiration in five hundred times the therapeutic dose The changes in the viscera at this dosage level are not significant [3]

TOLERANCE, COMFORT—With Alidase pain and swelling of hypodermoclyses were greatly reduced [4]

The recommended dose is 250 viscosity units for a hypodermoclysis of 500 to 1 000 cc Lesser amounts may be used for administration of drugs subcutaneously or smaller hypodermoclyses

It may be (a) injected through the wall of the rubber tube near the needle (b) at the site of injection prior to hypodermoclysis or (c) dissolved directly in the solution (when the amount of fluid to be injected is small) Alidase is supplied in ampuls of 250 viscosity units

"...a very valuable adjunct to the treatment of dermatitis due to plants, especially

POISON IVY..."(1)

PYRIBENZAMINE cream or ointment

Applied locally, Pyribenzamine hydrochloride usually gives prompt and prolonged relief from itching in dermatitis venenata due to poison ivy, oak or sumac

Pyribenzamine has also been found to give relief to the majority of patients with other itching dermatoses, "particularly atopic dermatitis and pruritus ani"[2]

"In many instances the local skin conditions are, of course, more rapidly and more completely eradicated by the combined topical and oral administration of this drug"[1]

TETRA-ETHYL-AMMONIUM CHLORIDE IN PERIPHERAL VASCULAR DISEASES AND ALLIED CONDITIONS ITS USES AND LIMITATIONS

MARTIN M FISHER, M D , New York City

(From the Medical Service of Kings County and Caledonian Hospitals)

RECENTLY a new method of blocking the autonomic ganglia by parenteral injection of the tetra-ammonium ion was reported [1–3] The physiologic and pharmacologic actions of the drug had been previously described [4 5] It is the purpose of this report to describe certain clinical applications and limitations of tetra-ethyl-ammonium chloride in peripheral vascular diseases and allied conditions, as well as to indicate its utility as a substitute for paravertebral block * The clinical value of paravertebral sympathetic ganglion block has been demonstrated [6–9]

Any treatment in peripheral vascular diseases cannot be properly evaluated without a qualitative and quantitative knowledge of the amount of vasospasm in the involved extremity It is now well established that there frequently exists with organic peripheral vascular disease an associated functional element of vasospasm This factor is mostly controlled by the sympathetic nervous system which can be affected by treatment

In the past it has been possible to diminish vasoconstriction by such procedures as paravertebral sympathetic ganglion blocks, continuous caudal anesthesia, spinal anesthesia, and local nerve blocks The action of tetra-ethyl-ammonium ion has been demonstrated on the superior cervical and stellate ganglion, as well as on the sympathetic vasoconstrictor mechanisms and the efferent vagal pathways [4] The response produced by the drug can be explained by the blocking of the autonomic ganglia, both sympathetic and parasympathetic Safety in the use of this drug in man as well as its ability to produce autonomic blockade has been evaluated It was shown that vasoconstrictor tone is necessary for the action of this drug Epinephrine or acetyl choline which acts peripheral to the autonomic ganglia is able to antagonize the effects of the tetra-ethyl-ammonium ion on the sympathetic and parasympathetic nerves

Method

Renal and stomach studies were carried out on hospital patients to note the effect of tetra-ethyl-ammonium chloride on the kidney function and gastric secretion Blood urea and urinary concentration and dilution tests were done before and after intravenous injections of the drug A Levine tube was passed to collect stomach specimens for testing the total and free acidity, as well as the volume of gastric juice in the unstimulated stomach Specimens were collected before and after injections

Effect of Intravenous Administration

After the injection a metallic taste on the tongue is usually described Then a flushing and feeling of warmth, accompanied with a sensation of pins and needles, comes over first the upper and then the lower extremities An incomplete dilatation of the pupil occurs, accompanied by temporary blurring of the vision and a sluggish reaction to light Occasionally ptosis of the upper eyelids is seen A tired, relaxed, and weak feeling is felt which is probably due to the fall in systolic and diastolic pressures This is usually noted one minute after injection Usually, there is an elevation of the heart rate to about 120 beats per minute The mouth becomes dry There is a rise in the skin temperature of the fingers and toes The blood pressure remains depressed for several minutes Usually the diastolic pressure is the first to start to rise Immediate postural hypotension may develop and persist after the return of the blood pressure to normal This may last, along with the dilatation of the pupils and increased skin temperature.

* Tetra-ethyl ammonium chloride was supplied as Etamon by the Department of Clinical Investigation, Parke Davis & Co through the courtesy of Dr E. C Von Der Heide.

It is, therefore, essential to keep the patient's head down off the pillow for three-quarters to one hour after the injection After that time the postural hypotension usually disappears

Excretion studies by precipitation of the tetra-ethyl-ammonium ion with reinecke salt, as in the determination of choline, indicate it is almost quantitatively excreted in the urine About 50 per cent of the drug can be recovered in twenty-four hours

Technic of Injection

The following technic was found eminently satisfactory, since only one case of transient syncope occurred in over 1,500 injections The technic itself is simple Prior to the injection, the patient is put into bed or on an examining table with his head off the pillow He is kept there until three-quarters of an hour after the injection (This is done to avoid the possibility of orthostatic hypotension)

The blood pressure cuff is placed on the arm above the vein to be injected The patient is reassured and put in basal condition of physical repose Blood pressure readings are taken repeatedly until at least three consecutive readings are stable, that is, a variation of not more than 4 to 6 mm of mercury systolic and 2 to 4 mm of mercury diastolic A number 25, Becton-Dickinson, 5/8-inch subcutaneous needle with a Huber point is used The solution is drawn into a sterile 5-cc syringe The blood pressure cuff which was left on the arm acts as a tourniquet It is inflated to distend the veins at the antecubital fossa

The injection into the vein is made, and blood is drawn back into the syringe to be certain that the needle is in the vein If the solution leaks into the surrounding tissues, pain will occur at the site of the injection, and occasionally fibrillary twitchings, which last for three to four hours, will be noted around the antecubital fossa No sloughs have been seen The injection is given slowly after the blood pressure cuff has been deflated, taking about thirty seconds for the first cubic centimeter The quality of the pulse and its rate are noted with the free hand, or by another observer at the other radial pulse Then the remainder of the solution is slowly injected at the rate of 1 cc per minute while the pulse is still being palpated

Usually the time to stop the injection is when the quality of the pulse changes and becomes less full Then the pressure readings are taken as soon after as possible in order to note the drops in blood pressure The quality of the pulse and its rate are also noted An ampule of epinephrine should be kept handy in case the patient develops syncope We have had only one occasion to use it in over 1,500 injections, and in that one instance we attributed it to a rapid injection.

Dosage

After observing some 582 patients in the last eighteen months, the following dosage schedule is suggested as a guide Generally, the higher the blood pressure, the smaller is the first dose (Table 1)

TABLE 1 —SUGGESTED DOSAGE FOR FIRST (INTRAVENOUS) INJECTION OF TETRA-ETHYL-AMMONIUM CHLORIDE

Control Systolic Blood Pressure (mm. of Mercury)	Number of cc.
90–140	3–4
142–160	2–3
162–170	2
172–200	1
200 and over	1/2

It has been our experience that after the first injection patients develop some degree of tolerance Therefore, it is necessary on subsequent injections to give *larger* doses to get the same block effect Lyons and his coworkers have established the fact that the maximum desirable effect is produced with 4 to 5 cc of the drug It is good clinical judgment, after noting the patient's reaction to the first injection, to increase gradually the dosage by a cubic centimeter or more each time until the maximum effect is attained We never give doses larger than 5 cc

Thrombophlebitis

Fifty-two hospital and private patients with acute superficial or deep thrombophlebitis were treated with tetra-ethyl-ammonium chloride. All of these had palpable tender veins, pain, calf tenderness, and a positive Homans sign As one would expect from experience with paravertebral block tetra-ethyl-ammonium ion produced the best results in these patients with acute phlebitis All had some degree of relief from pain in seven to ten minutes Calf tenderness was moderately relieved after deep pressure was attempted ten to thirty minutes after the injection In 26 instances one injection was sufficient to give permanent relief of pain

The elevated sedimentation rates had a tendency to drop three to five days after the first injection

The duration of the effects of relief of pain and warmth to the extremity in different individuals varied from only a few hours to permanent relief All patients showed some degree of relief of pain The edema subsided usually from three to five days after the relief of pain following bed rest and the intravenous sympathetic ganglion block.

In no instance was a pulmonary infarct noted after injection

There were many interesting case reports in

this series, but for brevity we have attempted to select those in each group which demonstrate the salient features of the action of the drug clinically Further reports will deal in detail with statistical evaluation of the clinical results

Case 1 —A twenty-five-year-old primipara in her ninth month of pregnancy was referred to us by an obstetrician after she developed an acute internal saphenous phlebitis with involvement of the superficial internal pudendal vein along the inner aspect of the thigh. After three injections of 4 cc (400 mg) weekly up to one week prior to labor, she underwent twelve hours of labor and had normal puerperium. She delivered a normal child The phlebitis had subsided two weeks prior to labor after the first injection and showed no abnormality after The sedimentation rate which had returned to normal antepartum remained normal postpartum.

Case 2 —A sixty-five-year-old man had an acute phlebitis of the left internal saphenous vein associated with bilateral varicose veins He had normal oscillometric readings His phlebitis was associated with calf tenderness and a palpable, tender vein There was streaking along the course of the vein accompanied by warmth and edema of the foot and ankle After 1 cc of tetra-ethyl-ammonium chloride intravenously, he had prompt relief of his pain. His edema subsided in three days, and he returned to work without any complications on the fourth day, despite the orders of his physician.

Six months later he developed phlebitis in the other leg (associated with four thrombotic varicose vein blowouts) surrounded by an area of cellulitis and edema. At this time he did not respond to seven daily injections of 3 cc (300 mm.) of tetra-ethyl-ammonium-chloride, dicoumarol for three weeks, and penicillin Subsequently, he had a ligation of the right saphenofemoral vein junction with good results after nine months follow-up

This patient serves as an excellent control to prove that, in the same person with the same disease, variations in the involvement of the veins require different approaches to therapy

In chronic thrombophlebitis where the symptoms and signs are present over one month, there is little element of spasm on a functional basis Tetra-ethyl-ammonium chloride in these cases gives but temporary relief of the pain and has no effect on the edema

Sudden Acute Arterial Occlusion

Thirteen hospital patients with sudden acute arterial occlusion were studied within the first twenty-four hours of their onset The sudden closure of a major artery to an extremity is catastrophic in the sense that loss of a limb or life is a possibility No diagnostic methods exist which offer absolute certainty for differentiating between embolism and thrombosis Most of these patients had auricular fibrillation with or without signs of congestive heart failure. All of these patients were in the fifth to the seventh decades of life with sclerosis of the peripheral arteries In most cases the symptoms were characterized by an onset of an abrupt attack of excruciating pain in the lower extremity This was followed by numbness, coldness, tingling, and loss of muscular power The pain had persisted despite morphine up until the time of admission when we saw these patients They were in various grades of shock with pallor and coldness to the lower extremities Mottling was noted in most instances The chief findings were lowered skin temperature, collapsed superficial veins, pallor, diminution of reflexes, and loss of sensation and muscular strength There was absence of pulsation which had been present, according to the referring physician, in some of the arteries of the involved extremity

In this group of 13, one showed rapid improvement following the use of tetra-ethyl-ammonium chloride blocks The pain was relieved, the color of the limb improved, and the skin temperature became elevated. The oscillometric readings remained unchanged The patient was given the intravenous ganglion block ($3^1/_2$ cc tetra-ethyl-ammonium chloride) every twelve hours for seven days

Of the other 12 patients with acute thromboembolic phenomena in the lower extremities, all had the same poor results with paravertebral blocks as with the intravenous sympathetic ganglion blocks When the intravenous sympathetic ganglion blocks were unsuccessful, we noted an increase in pain at the site of closure following the injection. We used this site of pain as a diagnostic aid in localizing the thrombus or embolus for the surgeon in preparation for embollectomy

Chronic Organic Occlusive Arterial Diseases

We have studied the effects of tetra-ethyl-ammonium chloride in 416 hospital and private patients with chronic organic occlusive arterial disease Of this group 12 patients had thromboangiitis obliterans, and 404 had peripheral arteriosclerosis

Thromboangiitis Obliterans —Of the group with thromboangiitis obliterans disease, six had previously been treated conservatively, three had a previous midthigh amputation, and three were untreated All 12 were treated with tetra-ethyl-ammonium chloride, and all other treatment was discontinued Those who smoked previously continued to smoke while under these observations Eight were symptom-free except for a mild amount of intermittent claudication after six months observation

One of these patients whose ulcer and pain in

his second left toe resisted previous therapy showed evidence of healing and relief of pain in three days following one injection His rest pain was controlled after a few subsequent injections, and he was discharged from the hospital with his ulcer completely healed in two weeks

Case 3—A previously untreated, thirty-six-year-old, ambulatory man with thromboangiitis obliterans had absent oscillations in his right foot and leg He had recurrent phlebitis of the left internal saphenous vein Intermittent claudication was present on walking one block Night pain had kept him awake continuously for one month so that he had suicidal tendencies After receiving 200 mg (2 cc) twice weekly for four months, there was a disappearance of his intermittent claudication, and night pain was markedly relieved The phlebitis had subsided, and there was no evidence after one year follow-up His total dose was 5 Gm. He continued to smoke during these observations

Case 4—Of interest is the thirty-four-year-old, hospitalized man who had thromboangiitis obliterans for thirteen years He had an ulcer on the second right toe with severe pain This man had no relief from morphine, Demerol, or papaverine The first three injections of 400 mg (4 cc) given daily produced about 50 per cent relief of pain Following this he submitted to a posterior tibial nerve sectioning with the same amount of relief This case was of significance to show the limitations of this drug, as well as of all other modalities in the treatment of thromboangiitis obliterans It has been our experience that if you do not get a prompt response with therapeutic doses, namely 4 to 5 cc, subsequent injections are of no further avail

Peripheral Arteriosclerosis Obliterans—Four hundred and four hospital and private patients with signs and symptoms of peripheral arteriosclerosis with or without diabetes have been studied As one would anticipate with paravertebral blocks, the least successful results were obtained with this group of patients This was particularly evident when the functional element of vasospasm was small or absent

They were in the age limit that ranged from fifty-eight to ninety-one years All showed x-ray evidence of arteriosclerosis of the extremities There was evidence of diminished circulation of the involved limb which was confirmed by oscillometric readings Many had evidence of gangrene

Those patients without gangrene had greater relief of rest pain with tetra-ethyl-ammonium chloride than with intravenous papaverine, spasmalgin, morphine, or Demerol The duration of relief varied from one to seventy-two hours

We noted that clean arteriosclerotic ulcers of the dorsum and plantar surfaces of the foot healed more readily with daily injections of tetra-ethyl-ammonium chloride only when there was relief of pain

FIG 1 Arteriosclerotic ulcers of thirty years duration in an eighty-two-year-old woman first seen in September, 1946

For example, one eighty-two-year-old woman had had eight arteriosclerotic ulcers on the dorsum of her right foot for thirty years (Fig 1) She had previously been treated with every known modality and had resigned herself to her wheelchair for the last twenty-nine years She received 350 mg of tetra-ethyl-ammonium chloride (3½ cc) twice weekly for four months, a

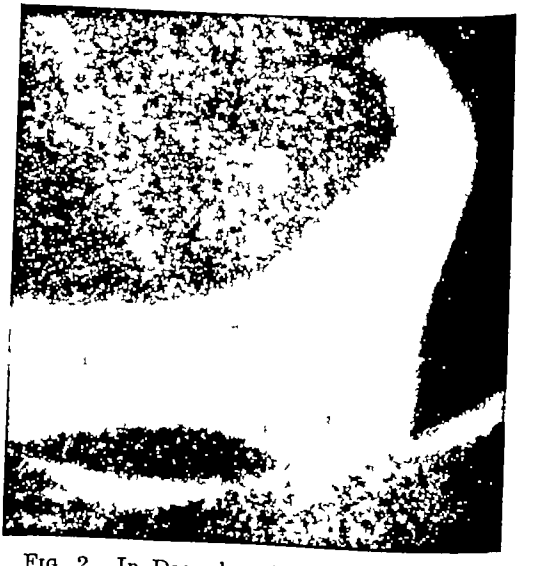

FIG 2 In December, 1946, ulcers completely healed after a four-month course of treatment with tetra-ethyl-ammonium chloride

total of 14 Gm In December, 1946, she started to walk, she wore shoes, bathed, and was free of pain The ulcers were completely healed (Fig 2) None have broken down for the eleven months since the treatment stopped

In all the arteriosclerotic ulcers that healed, we also used penicillin parenterally and tyrothricin, penicillin, or streptomycin locally to maintain wound cleanliness It is, therefore, difficult to evaluate the effect of healing ulcers with tetra-ethyl-ammonium chloride, yet we feel that healing was aided when there was relief of pain and spasm One must not conclude that the relief of pain and healing of ulceration was due to increase in circulation or any vasodilating action of the drug in these cases of arteriosclerosis Rather, the relief of pain appears to be similar in mechanism to the pain relief in causalgic states (*vide infra*)

In the diabetic arteriosclerotic cases where the wound infection could not be controlled, the results were uniformly poor

Diagnostic and Therapeutic Value in Hypertension

In this group, 30 hospitalized patients with hypertension were studied They were evaluated as to renal and vascular components Blood urea, blood creatinine, kidney function tests—namely, routine analysis, concentration tests, and urea clearance tests, were performed Eye ground studies were evaluated on all in this group Sodium amytal tests for determining the maximum drop in blood pressure were done on all patients as a control prior to the use of tetra-ethyl-ammonium chloride In this group of 30, 25 were found to have various degrees of renal involvement

The results with tetra-ethyl-ammonium chloride blocks in cases with chronic glomerulonephritis revealed little or no significant fall in blood pressure, either systolic or diastolic This observation was confirmed by the sodium amytal tests In five patients with uncomplicated essential hypertension studied with tetra-ethyl-ammonium chloride, it was found that a marked drop in blood pressure, both diastolic and systolic, occurred, similar in degree to the depressor response with the sodium amytal test

Of interest are three patients with essential hypertension who developed hypertensive encephalopathy in acute hypertensive crises They were treated with tetra-ethyl-ammonium chloride during the acute phase with dramatic results

Case 5—A M, a known hypertensive, age fifty-five, suddenly developed severe headaches, dizziness nausea, and vomiting He became semicomatose without evidence of cerebral or subdural hemorrhage His blood pressure was 280/180 Within one hour a pint of blood was withdrawn, lowering his blood pressure to 190/160, one half hour later, his blood pressure rose to 260/160 with a persistence of dizziness, headaches, nausea, and vomiting This patient seemed a candidate for an imminent cerebral accident One half cubic centimeter (50 mg) of tetra-ethyl-ammonium chloride was injected intravenously which lowered the blood pressure to a level of 160/-80 Immediately thereafter, the patient's nausea and vomiting ceased, and the headaches and dizziness disappeared The systolic blood pressure persisted below 180 mm. of mercury, which was his previous control blood pressure, as reported by his family physician He was discharged asymptomatic two weeks later but as a potential candidate for sympathectomy

Diagnostic Aid in Sympathectomy

In this group 20 hospital patients with peripheral arterial disease were studied to evaluate the possible therapeutic effect of sympathectomy Of the 20 with peripheral arterial disease who were considered as candidates for sympathectomy, 18 had advanced arteriosclerosis with gangrene The other two had thromboangiitis obliterans

Of the 18 peripheral arteriosclerotics, all were found to have a negative response to the tetra-ethyl-ammonium chloride diagnostic blocks The criteria for a negative response was based on (1) little or no increase in skin temperature, (2) little relief of rest pain or intermittent claudication, and (3) no effect upon wound healing Three of this group, despite negative responses to tetra-ethyl-ammonium chloride, were submitted to sympathectomy None showed any beneficial effects

Of the two patients with thromboangiitis obliterans selected as candidates for sympathectomy, both had a good positive response with the intravenous ganglion block Sympathectomy produced the anticipated good results

Causalgic Conditions and Allied Sympathetic Disorders

Twelve hospital patients with a diagnosis of causalgia, post-traumatic edema, or atrophy and phantom limb have been studied with tetra-ethyl-ammonium chloride Usually the choice of diagnostic terminology in these patients was difficult The injection of tetra-ethyl-ammonium chloride in these patients afforded temporary, and at times sustained, relief of pain. It also aided in establishing the diagnosis of sympathetic involvement, and lastly, it was a very effective therapeutic measure in some of these cases to help restore function In these amputees where the intravenous ganglion block gave little or no relief, usually the so-called phantom symptoms were due to an osteomyelitis at the tip of the bone or a pus pocket in the amputation flap

To those patients in this group whose syndromes followed fractures associated with atrophy or edema, the drug gave relief of pain and allowed for greater motion Likewise, following bone grafts to injured lower extremities, similar improvement was noted

Ménière's Disease

Three patients with Ménière's disease, confirmed by ear, nose, and throat consultations, have been treated with tetra-ethyl-ammonium chloride intravenously Two of these three showed marked improvement in their headaches and dizziness Further studies on a larger series of cases are needed before evaluation of this therapy in Ménière's disease can be made

Multiple Sclerosis

Based on the success in the treatment of acute thrombophlebitis with tetra-ethyl-ammonium chloride and with the recent emphasis on the vascular etiology of multiple sclerosis, we attempted the treatment of acute exacerbations This fundamental pathologic fact must be clear that the only substantial prospect of gain from specific treatment in multiple sclerosis must be in the protection from fresh relapses

Some 56 patients with multiple sclerosis are being studied These patients have had the disease from three to fifteen years and vary in their severity from mild to very severe These patients have been treated for the last twelve months While it is too early to evaluate the results in this disease, which is characterized by remissions and recurrences, some of the preliminary results in the early diagnosed and mildly involved patients are sufficiently encouraging to warrant further investigation over a long period of time on a large scale (This will be a subject of a separate paper)

Toxic Effects and Precautions

In the doses that were used in this study wherein over 1,500 injections were used, no serious toxic effects were noted In one patient with very high blood pressure who was receiving an infusion of heparin, a state of syncope following the intravenous injection was noted This was quite transitory in nature and responded quickly to 1 cc of epinephrine solution 1 1,000 intravenously In two patients, when the injection of tetra-ethyl-ammonium chloride was given during the extremely hot weather, nausea and vomiting were noted The sensation of weakness and fatigue was pronounced in these two but disappeared within thirty minutes No epinephrine had to be used in these patients

The utilization of tetra-ethyl-ammonium chloride to produce autonomic blockade as an outpatient procedure is to be encouraged with caution. During the last eighteen months, we have kept all patients in a supine position for one-half hour to forty-five minutes following the injection If, upon standing, no dizziness or weakness occurs, the postural hypotension is not marked They are allowed to walk around the treatment room for a few minutes They are instructed to lie down if any sense of weakness or dizziness is experienced It is unwise to drive a car after the injection, because of the loss of accommodation and the possibility of postural hypotension. These precautions were adequate for ambulatory treatment

It is to be emphasized that tetra-ethyl-ammonium chloride is a most powerful pharmacologic agent due to its ability to lower the blood pressure acutely It is obviously not advisable to use it in patients in any condition of shock where the blood pressure has already been depressed It is not feasible as a routine treatment for hypertension, although it will relieve the symptoms of the complications of hypertension in many instances

Discussion

Renal and gastric studies, done on the first 25 patients of this study with therapeutic doses, revealed but a slight inhibition of the peristalsis of the gastrointestinal tract In all, these minimal effects wore off in eight hours

No clinical abnormalities were noted to the skin, gastrointestinal tract, or to kidney function on prolonged use of the drug in 36 patients with multiple sclerosis treated for twelve months

Vasospasm is not an unalterable pathologic lesion but a physiologic or functional derangement which can be satisfactorily influenced by appropriate therapy The element of vasospasm is frequently of decisive importance in the treatment of peripheral vascular disease because it is the one controlled factor Ochsner and DeBakey showed that vasospasm is the predominant feature in those cases where there is little or no structural change and stressed the fact that vasospasm exists as a prominent factor in some organic vascular disease [6 7] In this latter group, the vasospasm involves the collaterals To determine the presence, absence, and extent of vasospasm is important Whenever possible, conservative measures are indicated in the treatment of peripheral vascular disease Measures for the elimination of factors which increase vasospasm should be employed, namely, relief of pain, elimination of smoking, and avoidance of extreme changes in environmental temperatures Also measures which attempt to produce vaso-

dilatation should be used, namely, alcohol, typhoid vaccine, reflex heat, oscillation bed, passive vascular exercises, etc These are usually sufficient to produce complete relief of the symptoms In the rapidly progressive case where there is a marked degree of vasospasm, more vigorous attack on the sympathetic nervous system is desirable The relief of vasoconstrictor impulses may be enough to permit return of circulation to normal This forms the rationale for sympathetic ganglion block, either paravertebral or intravenous

The advantages of the intravenous over the paravertebral ganglion block are as follows

1 It is easier to perform than paravertebral blocks With a therapeutic dose one usually gets a block effect

2 There is not the discomfort produced by multiple paravertebral needles

3 In recent postoperative cases and during the third term of pregnancy, where discomfort is produced by lying on the side, this is eliminated with intravenous ganglion block.

4. In the upper extremities, intravenous ganglion block eliminates the possibility of trauma to the pleura entailed in a novocaine stellate ganglion block.

5 The patient need not be turned who is acutely ill, thereby eliminating the fear of breaking of a thrombus in a patient with phlebitis

6 It is easy to repeat frequently

The disadvantages are that the blood pressure drop produces temporary weakness which may last from one-half to two hours Rarely, syncope occurs, which is readily controlled with epinephrine

Conclusions

1 Tetra-ethyl-ammonium chloride administered intravenously in doses varying from 50 mg (½ cc) to 500 mg (5 cc) usually produces the effects of a block of the autonomic ganglia

2 It has both therapeutic and diagnostic value as a generalized sympathetic ganglion block.

3 Five hundred and eighty-two patients have been treated with over 1,500 injections with no serious toxic effects

4. A dosage schedule is suggested which has proved to have no adverse reactions in our hands Generally, the higher the initial blood pressure reading, the smaller is the first dose

5 In none of the 582 patients treated with tetra-ethyl-ammonium chloride was a pulmonary infarct noted after treatment Careful observations were made on this score

6 There is no contraindication to its use in adults in regard to age It is not recommended in any condition of shock where the blood pressure has been suddenly depressed It is not recommended as a routine treatment for uncomplicated hypertension

7 There has been significant relief of pain in cases of acute thrombophlebitis In one half of these patients, one injection was sufficient to give permanent relief of pain

8 In acute arterial occlusive disease, the intravenous ganglion block helps to give one an index of the presence of vasospasm. When this element is present, there has been some relief of pain, and intermittent claudication has been improved When there is no element of vasospasm, the results were poor

10 As a diagnostic aid in selecting patients with essential hypertension for sympathectomy, tetra-ethyl-ammonium chloride blocks produced significant drops in blood pressure, both systolic and diastolic In comparison to the sodium amytal tests, the fall in blood pressure was equal and, in some instances, greater

11 Dramatic relief in acute hypertensive crises and hypertensive encephalopathies has been observed

12 As a diagnostic aid in selecting patients with peripheral vascular disease for sympathectomy, tetra-ethyl-ammonium chloride is of particular value

13 In causalgic conditions and allied sympathetic disorders, the intravenous ganglion block helped to relieve pain and aided in diagnosing sympathetic involvement

14 Patients with multiple sclerosis and Ménière's disease have been treated with tetra-ethyl-ammonium chloride Further studies on a large series of cases over a prolonged period of time are being undertaken before a final evaluation can be made

15 The advantages and disadvantages of the intravenous ganglion block have been discussed in relation to paravertebral blocks

PNEUMOCOCCAL MENINGITIS

JOHN K MENEELY, JR, M D, Albany, New York

(From the Department of Medicine, Albany Medical College)

PRIOR to the era of chemotherapy and antibiotics, pneumococcal meningitis was an almost uniformally fatal disease Ruegsegger reported a total of 630 cases prior to 1937 with no recoveries [1] Hogg and Bradley reported a 99 per cent mortality rate for all age groups, prior to the sulfadiazine era [2] The introduction of the sulfonamide drugs brought an improvement, and Hodes *et al* treated 60 cases of pneumococcal meningitis with various types of sulfonamide drugs with a mortality rate of 58 per cent [3] Steele and Gottlieb reviewed the literature following the introduction of sulfonamide therapy and found that the mortality rate varied from 31 to 80 per cent [4]

Following the introduction of combined sulfonamide and penicillin therapy, the statistical results improved even more The most thorough review of this therapy was by Hall and others who reported on a total of 162 patients in 1946 with a mortality rate of 54 3 per cent, but in their own series of 17 cases they had a mortality rate of 23 5 per cent [5] That the mortality rate varied from year to year was noted by Levinson *et al* These authors had a mortality rate in 1945 of only 16 5 per cent, while in 1946 it was 62 5 per cent They utilized the same therapy in both years, and the causative organisms did not vary significantly They felt the mortality increase to be due to an alteration in the virulence of the organism [6]

We have reviewed all cases of pneumococcal meningitis treated in the Albany Hospital with a combined penicillin and sulfonamide regime and found an over-all mortality of 28 per cent The cases have been grouped according to their primary foci and are presented in tabulated form below

Comment

Almost all authors are in accord that pneumococcal meningitis, occurring as a complication of pneumonia, carries a serious prognosis Sweet and his coworkers noted the worst prognosis to be in those patients who had pneumonia, bacterial endocarditis, or a head injury as the primary focus or in those cases in which the patient was too critically ill on admission to give a satisfactory history [7] However, Vogel *et al* felt that the prognosis was better in those cases developing secondary to head trauma [8] Hall and others noted the higher mortality in the extremes of life along with Applebaum and Nelson, who also found a higher mortality rate in those patients with a bacteremia [5,9] They did not find any correlation between mortality and the duration of illness prior to the institution of penicillin therapy, as had been pointed out by other authors

In our series it was evident that those cases in which the primary focus was pneumonia carried a graver prognosis (Table 1) The 38 per cent mortality in pneumonia compared unfavorably with the 21 per cent in otitis media. The type of organism did not seem to bear any relation to the mortality

One factor which seemed to influence the outcome of those cases of meningitis associated with pneumonia was the presence of complications All three fatalities showed serious complications one patient apparently manifesting severe sulfonamide toxicity, a second having loculated empyema, lung abscesses, pericarditis, and acute hemorrhagic pneumonia, and the third showed a diffuse pneumonitis, cystitis, generalized arteriosclerosis, and lues (Table 1)

A second factor which appeared to be related to the outcome in our cases was the duration of disease prior to therapy In the three fatal cases which died with otitis media as the primary focus, two were moribund on entry, and one patient had apparently had the condition for a week before the initial diagnostic lumbar puncture was done (Table 2) Of the three patients who died with pneumonia as the primary focus, one was moribund on entry and died six hours later, and the second had been delirious for four days prior to his initial diagnostic lumbar puncture

Of considerable importance also in the prognosis was the dosage schedule The one fatality in the miscellaneous group was treated early in the penicillin era and received grossly inadequate dosages without intrathecal penicillin (Table 3) The necessity of giving vigorous and prolonged penicillin therapy, both intrathecally and intramuscularly, combined with prolonged sulfadiazine therapy is commented on by most authors Sweet stressed the importance of continuing the use of penicillin for a considerable period after the clinical evidences of infection had subsided [7] Waring and Smith maintained combined therapy for at least six days following the last positive spinal fluid culture At this time penicillin was stopped, but sulfonamide was continued for an additional seven to fourteen days [10] Hall and others utilized intrathecal penicillin

TABLE 1.—PNEUMONIA AS THE PRIMARY FOCUS IN EIGHT CASES (THREE DEATHS—38 PER CENT MORTALITY)

TABLE 3.—Miscellaneous Primary Foci in Three Cases (One Death—33 Per Cent Mortality)

Fatality—Recoveries	Age	Penicillin: Intramuscular (Days)	Penicillin: Intrathecal (Days)	Sulfonamide (Days)	Types of Pneumococcus: Cerebrospinal Fluid	Types of Pneumococcus: Blood Culture	Causes	Remarks
	77	4	0	4	15	Not done	Multiple sinus operation	Died 6 days after onset of neurologic symptoms. Dosage of penicillin inadequate.
	49	28	10	18	8	8	Unknown	Meningitis cleared 4th day. Neurologic residua on discharge 2 months later, entirely gone 3 years later
	25	20	4	5	7	Not done	Cerebrospinal fluid fistula	Ethmoid fistula closed at operation and complete recovery, home on 21st day

of maintaining high levels of sulfadiazine during the combined therapy and attempted to attain a level between 20 to 25 mg per cent daily [12] Most authors are in accord with him that the daily dosage of intrathecal penicillin need not be more than 10,000 units

The importance of operative intervention on those cases with otitis media and mastoiditis is noted by most authors [5 9 11] Applebaum and Nelson cited seven cases in which a mastoidectomy resulted in striking improvement after failure to respond to penicillin therapy [9] Waring and Smith, however, minimized the importance of operative removals of primary foci [10]

Our experience would indicate the necessity for early operation None of the three cases which died with otitis media as the primary focus was operated on, whereas only two of the 11 cases who survived did not have some form of operation, eight having radical mastectomies and one a myringotomy (Table 2)

Summary

Twenty-five cases of pneumococcal meningitis with an over-all case mortality of 28 per cent are reported All patients received combined intramuscular penicillin and sulfadiazine therapy and, with the exception of one case, intrathecal penicillin The mortality of eight cases with pneumonia as the primary focus was 38 per cent, the mortality of 14 cases with otitis media as the primary focus was 21 per cent, and the mortality for three cases with other foci was 33 per cent

From a review of the literature and from a survey of our own cases, it would seem that adequate therapy for pneumococcal meningitis would include the following daily intrathecal penicillin injections of 10,000 units until the spinal fluid is sterile, intramuscular penicillin for at least three days after the temperature is normal, and sulfonamide therapy for at least a week after all signs of infection had subsided The importance of early operative removal of primary foci is stressed

POLL OF SMALL BUSINESS, INC

The National Federation of Small Business, Inc has just completed tabulation of a vote for or against compulsory sickness insurance among its 136,000 members

The vote or mandate, as the federation calls it, is as follows

For Socialized Medicine	9%
Against Socialized Medicine	89%
No opinion	2%

The federation mailed a questionnaire to every member The marked ballot was sent to a teller appointed in each congressional district The teller in turn notified the congressman in each respective district of the vote and then each teller sent his total to the federation's headquarters where all the votes were tallied The headquarters office notified all of the congressmen of the vote result —*Secretary's Letter, A.M.A , March 14, 1949*

A SURVEY OF 723 CASES OF CHOLECYSTITIS AND CHOLELITHIASIS

RALPH COLP, M D , and LOUIS J LESTER, M D , New York City
(From the Mount Sinai and Gouverneur Hospitals)

THIS summary is based on 723 consecutive cases of biliary tract disease which were subjected to operation The purpose in analyzing this group is to determine the incidence of the various types of gallbladder pathology, the procedures which were used in dealing with them, and the results obtained The series is unique in that all cases were private patients operated on by the senior author The cases were arbitrarily divided into groups based upon the pathology in the gallbladder

Acute Cholecystitis

The diagnosis of acute cholecystitis cannot be based either on the clinical picture or on the gross operative findings Frequently, in some patients who are acutely ill and in others in whom exploration discloses an apparently acute inflammatory process, the pathologic report of the excised gallbladder does not confirm the clinical impression It was decided, therefore, that the classification of cases should be determined by the pathologist's report With this criterion, there were 88 cases of acute cholecystitis in this series The age range was from thirty to seventy-nine years, the disease being largely confined to middle life The sex incidence is of some interest, there being 50 men (57 per cent) and 38 women (43 per cent) in this group This is rather surprising since gallbladder disease is generally acknowledged to be about twice as prevalent in women as in men. This preponderance of women is demonstrated by the cases of chronic cholecystitis which will be discussed subsequently, but in this series of acute cases the men predominated The reason for this may be the greater frequency of heavy physical activity among men. Trauma may lead to the impaction of a stone in the ampulla with a resulting hydrops

In analyzing the history of these cases of acute cholecystitis it was found that 22, or exactly one fourth of the group, were experiencing their first attack of gallbladder disease In other words, 25 per cent of these patients were not aware that they had an infection of the biliary tract until they were beset with an acute attack of cholecystitis Since in the great majority of these patients stones were present in the gallbladder at the time of operation and since calculosis must have been present for an indefinite period of time preceding the attack, it follows that in these patients the biliary calculi did not cause any symptoms Silent stones are not innocent stones and cannot be handled with complacence At any time a stone may migrate and become impacted in the neck of the gallbladder, precipitating an acute hydrops with all its serious implications The presence of stones in the gallbladder must be regarded as visible evidence of disease in an organ which should usually be extirpated

Sixty-six cases in this group (75 per cent of the total) had previous symptoms of gallbladder disease before the onset of the acute attack requiring operative interference Obviously, this large group of patients neglected the signs and symptoms of a diseased gallbladder which could have been removed during an interval phase with comparative ease and safety, rather than during an acute attack with its increased hazards

In the management of acute cholecystitis, no hard and fast rules were followed, and each case was treated as an individual problem Patients were hospitalized promptly, but operation was not performed with the same degree of urgency as in acute appendicitis It was considered most important to correct dehydration, electrolyte loss, and azotemia, as well as to replenish liver glycogen. During this time, anywhere from six to twenty-four hours, the patient's clinical course was carefully observed, especially for the occurrence of chills and the presence of diabetes Special attention was given to the white blood cell count, the temperature, and an evaluation of the abdominal findings If the clinical impression seemed to confirm a progression of the disease, if chills and high fever occurred, especially in diabetics, then operation was performed as soon as the patient's physical condition was deemed satisfactory Certainly the removal of an acutely inflamed gallbladder eliminates the incidence of perforation, biliary peritonitis, and portal pylephlebitis However, if the clinical picture showed definite regression, then careful observation was continued, for it was found that many of these cases would subside spontaneously so that cholecystectomy could be deferred for a later interval procedure Chemotherapy is considered to have little place in the treatment of acute cholecystitis and was not used unless there was another coexisting indication

It should be emphasized here that the phrase, "acute cholecystitis," is a generic term which covers inflammatory processes of varying degrees of severity It does not include many gallbladders which were removed during an acute clinical attack or those which appeared to be thickened and mildly inflamed at the time of operation but in which no microscopic evidence of acute inflam-

TABLE 3.—Miscellaneous Primary Foci in Three Cases (One Death—33 Per Cent Mortality)

Fatality	Age	Penicillin: Intramuscular (Days)	Penicillin: Intrathecal (Days)	Sulfonamide (Days)	Types of Pneumococcus: Cerebrospinal Fluid	Types of Pneumococcus: Blood Culture	Causes	Remarks
Recovered	77	4	0	4	15	Not done	Multiple sinus operation	Died 6 days after onset of neurologic symptoms. Dosage of penicillin inadequate
	40	28	10	18	8	8	Unknown	Meningitis cleared 4th day. Neurologic residua on discharge 2 months later, entirely gone 3 years later

of maintaining high levels of sulfadiazine during the combined therapy and attempted to attain a level between 20 to 25 mg. per cent daily.[12] Most authors are in accord with him that the daily dosage of intrathecal penicillin need not be more than 10,000 units.

The importance of operative intervention on those cases with otitis media and mastoiditis is noted by most authors.[5,9,11] Applebaum and Nelson cited seven cases in which a mastoidectomy resulted in striking improvement after failure to respond to penicillin therapy.[9] Waring and Smith, however, minimized the importance of operative removals of primary foci.[10]

Our experience would indicate the necessity for early operation. None of the three cases which died with otitis media as the primary focus was operated on, whereas only two of the 11 cases who survived did not have some form of operation, eight having radical mastectomies and one a myringotomy (Table 2).

Summary

Twenty-five cases of pneumococcal meningitis with an over-all case mortality of 28 per cent are reported. All patients received combined intramuscular penicillin and sulfadiazine therapy and, with the exception of one case, intrathecal penicillin. The mortality of eight cases with pneumonia as the primary focus was 38 per cent, the mortality of 14 cases with otitis media as the primary focus was 21 per cent, and the mortality for three cases with other foci was 33 per cent.

From a review of the literature and from a survey of our own cases, it would seem that adequate therapy for pneumococcal meningitis would include the following: daily intrathecal penicillin injections of 10,000 units until the spinal fluid is sterile, intramuscular penicillin for at least three days after the temperature is normal, and sulfonamide therapy for at least a week after all signs of infection had subsided. The importance of early operative removal of primary foci is stressed.

POLL OF SMALL BUSINESS, INC

The National Federation of Small Business, Inc. has just completed tabulation of a vote for or against compulsory sickness insurance among its 136,000 members.

The vote or mandate, as the federation calls it, is as follows:

For Socialized Medicine	9%
Against Socialized Medicine	89%
No opinion	2%

The federation mailed a questionnaire to every member. The marked ballot was sent to a teller appointed in each congressional district. The teller in turn notified the congressman in each respective district of the vote and then each teller sent his total to the federation's headquarters where all the votes were tallied. The headquarters office notified all of the congressmen of the vote result.—*Secretary's Letter, A.M.A., March 14, 1949.*

precipitated especially by fatty foods In the absence of colic, one is hesitant to subject a patient to surgery unless stones or a nonvisualizing gallbladder can be demonstrated by x-ray The results of cholecystectomy for noncalculous cholecystitis are notoriously poor, and one should be quite hesitant to advise operation if indigestion is the only symptom and cholecystography reveals a functioning gallbladder All patients, prior to operation, were subjected to cholecystographic studies, and only those who revealed either a nonvisualization of the gallbladder or the presence of stones were explored

The preoperative preparation of patients for biliary tract surgery depends upon their clinical status In the usual elective cases the x-rays and medical evaluation are done before admission. Electrocardiographic tracings are made in elderly patients, and a urea nitrogen determination is usually done If the history or clinical findings suggest a poor nutritional state, the total proteins of the blood are determined, and corrective measures taken if necessary Obese patients are advised to reduce before submitting to surgery, to avoid the high incidence of postoperative complications which are associated with obesity Routine blood counts and urinalyses are performed in the hospital preoperatively

In patients with jaundice certain liver function tests are done These usually consist of the cephalin flocculation, alkaline phosphatase, Van den Bergh, cholesterol esters, and the prothrombin level Stool and urine are examined for the presence of bile derivatives Injections of glucose and amino acids, along with vitamin B complex, vitamin C, and vitamin K are given parenterally for several days The blood grouping and Rh are determined, and transfusions are given as indicated

It is a routine on our service to introduce a Levin tube into the stomach prior to any laparotomy This prevents postoperative nausea, vomiting, and distention and is an important factor favoring a smooth convalescence

All operations on the biliary tract are performed under spinal anesthesia unless there is some contraindication There is nothing which facilitates exploration so much as the marked relaxation and freedom from respiratory movement which spinal affords In apprehensive patients, intravenous sodium pentothal is sometimes used as a supplementary agent unless jaundice is present In those occasional cases in which general anesthesia is used, curare has been found of great aid in providing adequate relaxation

Cholecystectomy with drainage, with or without choledochostomy is the procedure of choice in chronic cholecystitis and was performed in 99 per cent of these patients In only five instances was cholecystostomy performed and all of these patients were over seventy years of age and in poor physical condition Four of these five required choledochostomy as well A surgeon must have an excellent excuse for not removing a diseased gallbladder, and cholecystostomy should be reserved for only a very few poor risk cases

Retrograde cholecystectomy in our hands is a simpler and safer procedure than beginning the dissection of the gallbladder at the ampulla The opponents of this procedure cite as a disadvantage the fact that the field is obscured by oozing from the liver bed during retrograde removal This is not encountered if the dissection is done in the proper cleavage plane Besides, any bleeding from the liver bed is easily controlled by gauze held in place by a retractor It is significant that most surgeons agree that difficult cholecystectomies, such as one encounters with acute infections of the gallbladder, should be done from the fundus downwards If this method is preferred for difficult situations, it would seem that it should be most satisfactory for the routine cases We feel that the common and hepatic ducts can be visualized with greater safety by this method, and it has proved eminently satisfactory in this series of cases Drainage is employed routinely after every cholecystectomy by placing a Penrose drain in Morison's pouch

For a number of years, early ambulation has been practiced Patients are allowed in a chair the day following operation They become ambulatory in rapidly progressive stages and can usually walk to the bathroom in two or three days It is difficult to assess the role of this program in the reduction of postoperative complications such as thrombosis and pneumonia However, there is no doubt that early ambulation greatly shortens the period of convalescence, promotes appetite and muscular tone, and leads to a general feeling of well-being The average patient following cholecystectomy is allowed home on the eighth or ninth day

In many cases additional procedures were done incidental to cholecystectomy Prophylactic appendectomy was performed through the same incision whenever it was possible to deliver the cecum and when the case was uncomplicated. In obese patients, or following a difficult cholecystectomy, no attempt was made to remove the appendix. In three patients in whom a subtotal gastrectomy was performed, cholecystectomy was done as an incidental procedure In one case the gallbladder had to be removed because of firm inflammatory adherence to an active duodenal ulcer In the other two cases, the subtotal

matory changes were reported It is well known that contents of a gallbladder which are often considered purulent are, in reality, "calcium milk" or inspissated bile, mucus, and cholesterol crystals In this group of 88 acute cases confirmed pathologically, there was a high proportion of very severe infections There were 15 cases of frank gangrene of the gallbladder, and in this group one patient presented an acute pancreatitis with fat necrosis, another had a pericholecystic abscess, and a third had a free perforation with bile peritonitis There were four other cases of pericholecystic abscess There were three cases of true empyema and one of marked ulcerative inflammation Thus there was a total of 23 cases in which the infection in the gallbladder could be termed "very severe"

Cholecystectomy was the procedure of choice for acute cholecystitis, being performed in 78 of the 88 cases In the other ten patients, cholecystostomy was done These were poor risk patients, in the older age group and acutely ill Several had associated disease such as diabetes, hypertensive cardiovascular disease, and coronary sclerosis Cholecystostomy was only done as a simple expeditious procedure to provide drainage of acute infection and when it was feared that the life of the patient would be seriously jeopardized by the more radical procedure of cholecystectomy Cholecystostomy is never the procedure of choice for acute cholecystitis It is to be employed as a life-saving measure in selected cases

Stones were found in 79 cases (90 per cent), and in nine cases (10 per cent) there were no calculi It is felt that many of these acute noncalculous inflammations are the result of an activated pancreatic reflux [1]

Six patients in this group of 88 had a history of previous jaundice Five other patients were actually icteric at the time of operation In these 11 cases the choledochus was explored in only one, because, in addition to being jaundiced, a dilated common duct was found at the time of operation However, no stone was found in this duct

In the six patients with a history of jaundice and in the four other patients who were actually jaundiced at operation, the common duct was not explored A history of jaundice is not considered a reliable indication for exploration unless the jaundice can be confirmed by a medical witness Patients are often very vague about the color of their urine or skin, and they are inclined to give false positive answers in response to leading questions We do not feel that exploration of a common duct is an innocuous procedure Choledochotomy may present technical difficulties and is often accompanied by postoperative complications which increase the period of convalescence. In those patients who were actually jaundiced at the time of operation, the icterus was usually mild and transient We believe that it is usually due either to an inflammatory edema around the common duct, to actual cholangitis, or to reflex spasm of the sphincter of Oddi For this reason it is felt that the findings at operation should determine the indication for common duct exploration If the duct is of normal caliber, and no stones can be palpated within it and if the cystic duct is narrow, then there can be little reason for opening the common duct When an acute inflammatory process is present in the gallbladder and the common duct appears normal, then it becomes extremely likely that a low-grade jaundice is due to causes other than intraductal lithiasis Of the ten patients with a history of jaundice or actual jaundice whose common ducts were not explored, only one patient (a woman aged seventy-nine) had subsequent recurrent colic Two years later she had a secondary operation, at which time stones were removed from her common duct The other nine patients have remained well This substantiates the contention that jaundice alone is not a reliable indication for choledochotomy

The postoperative complications encountered were wound infection in two, dihiscence in two, subphrenic abscess in one, pneumonia in one, and phlebitis in one There was one death in this group (a mortality rate of 1 1 per cent) This occurred in a patient who eviscerated on the first postoperative day and succumbed to a pneumonia two days later

Chronic Cholecystitis

There were 568 cases of chronic cholecystitis in this series Women outnumbered men more than two to one The patients were from all decades between the second and eighth, with the largest number being in the age group forty to forty-nine This is in conformity with the generally recognized predominance of biliary disease in middle-aged women

The history of these patients was analyzed for the incidence of pain, dyspepsia, and jaundice Pain was by far the most important complaint, occurring in 508 cases, or 89 per cent of the total However, the type of pain was variable In some it was characterized by definite attacks of acute colic, in others it was a chronic ache of varying intensity and prone to exacerbations after dietary indiscretions Most of these patients who had pain also complained of some degree of indigestion. There were 60 patients (11 per cent) whose primary complaint was indigestion without pain Their symptoms were marked by bloating and belching, with epigastric distress and nausea

Secondary Common Duct Operations

Common duct strictures and reconstructions are not included in this discussion There were 19 common duct explorations in patients who had previous surgery confined solely to the gallbladder Sixteen of these had had a cholecystectomy and three a cholecystostomy performed at other hospitals Exploration revealed choledochal stones in ten cases In one patient there was evidence of chronic pancreatitis In another patient the common duct appeared to be normal

There were seven instances in which the common duct was dilated and stones were not found We feel that this group of cases represents the end result either of a recurrent spasm of the sphincter mechanism or a stenosis of the papilla due to inflammation or hypertrophy of its musculature In six of these patients, as well as in two in whom common duct stones were found, endocholedochal sphincterotomy was performed In the majority of cases the symptoms were relieved [2]

There were six patients who had had previous common duct explorations in addition to cholecystectomy elsewhere The presenting symptoms in four of these patients were colic and jaundice, in another jaundice alone, and in the sixth fever and dyspepsia At operation a stone was found in the common duct in four patients and a gallbladder stump and dilated duct in a fifth One patient had only a dilated duct without stones, and in this case a sphincterotomy was performed It is to be noted that most of the cases of biliary dyskinesia are due to stones It is highly probable that these stones were missed at the initial operation, although calculi may form primarily in the common bile duct One can be sure that if even a minute amount of calcareous material is left in the duct, it can act as a nidus for further precipitation

There were no deaths in these 25 cases of secondary common duct explorations

Carcinoma of the Gallbladder

A number of tumors of the gallbladder were encountered in this series There were eight cases of carcinoma, seven of which had cholelithiasis, three cases of benign papilloma, and one fibroma Carcinoma of the gallbladder is not a rare disease and is almost invariably associated with stones in the gallbladder Since the prognosis in carcinoma of the gallbladder is uniformly bad and since the incidence in this series (1 per cent) is actually higher than the mortality rate, one is justified in removing calculous gallbladders if for no other reason than as a prophylaxis against cancer

One case of carcinoma of the hepatic duct and another carcinoma of the ampulla of Vater were encountered in this series

Summary

1 Seven hundred twenty-three consecutive cases of biliary tract disease are reviewed

2 Eighty-eight cases of acute cholecystitis were managed on an individualized basis Cholecystectomy was performed in a great majority of cases, cholecystostomy being reserved for a few critically ill patients Transient jaundice associated with acute cholecystitis does not usually require common duct exploration

3 Among 568 cases of chronic cholecystitis, 94 per cent had stones Cholecystectomy was performed in 99 per cent of the cases The common duct was explored in 7 per cent, and stones were found in 71 per cent of those explored

4 Preoperative preparation, anesthesia, operative technic, and postoperative complications are discussed

5 Findings in secondary common duct explorations are presented

PENICILLIN IN VENEREAL DISEASE CONTROL

Cases of early syphilis are being treated at the United States Marine Hospital, Staten Island, with as little as forty-five cents worth of penicillin This was announced recently by Dr R C Arnold, associate director of the Venereal Disease Control Research Laboratory of the U S Public Health Service, at the annual conference of the New York Tuberculosis and Health Association at the Hotel Statler

The small penicillin dosage of 300,000 units, or one cubic centimeter, is given in a single injection into a muscle, Dr Arnold said. He added that even this small amount of the antibiotic drug would cost many more times his 45-cent figure if bought at the corner drug store, the price to the hospital being at U.S. Government wholesale rates

"Even then the small dosage is strictly experimental," Dr Arnold said "We recommend intramuscular injections of from two to three times that amount"

Dr Arnold said that the single injection method used at the Marine Hospital cures syphilis in 72 hours If gonorrhea is present the one injection kills that disease at the same time

The incidence of both syphilis and gonorrhea, Dr Arnold said, has dropped in a spectacular manner since the end of the war In the country as a whole the decrease for syphilis has been about 22 per cent, with a drop of some 40 per cent being recorded in the larger cities This decrease he attributed to a "settling of the population' and to the advance of penicillin therapy

gastrectomy was comparatively simple, and since stones were present in the gallbladder, it was felt that cholecystectomy could be done without additional hazard These complementary procedures did not add to the mortality or increase the morbidity

In this series of 568 cases of chronic gallbladder disease there was a history of jaundice in 48 patients, and jaundice was actually present in 23 patients at the time of operation A comparison was made of the findings and procedures in those cases which had only a history of icterus and in those which actually presented clinical evidence of jaundice at the time of operation

We have already given our indications for exploration of the common duct in the discussion of acute cholecystitis The majority of cases with only a history of jaundice did not present sufficient evidence at the time of operation to warrant exploration of the common duct In only 38 per cent of these patients an exploration of the choledochus was performed because of the presence of palpables tones or a dilatation of the common duct The ducts which were explored contained stones in 55 per cent of the cases

However, a much higher percentage of ducts was explored (65 per cent) in those cases in which jaundice was actually present at the time of operation In these, stones were present in 73 per cent This incidence of stones in the common duct is higher than that reported by most observers, but that is to be expected, since the criteria employed here for exploration were more rigid

In addition to the group of jaundice cases analyzed above, the common duct was explored in eight other patients who were not jaundiced In these cases the choledochus was definitely dilated or contained calculi which were palpable Stones were found in all instances

In summary, the total number of common ducts explored in 568 cases of chronic cholecystitis was 41, or 7 per cent of the total Stones were found in 29 of these common ducts, or 71 per cent of those explored The high incidence of negative findings in the common duct, in spite of careful selection of cases for exploration, leads to some interesting speculation There must have been some obstruction to the outflow of bile to produce clinical jaundice and a dilated duct found at operation There may be several explanations for this One is that small calculi frequently traverse the common duct and become impacted in the ampulla for a varying length of time before being extruded into the duodenum Another explanation for transient jaundice in these cases may be attributed to a spasm of the sphincter mechanism as a reflex response to inflammation elsewhere in the biliary tract This reflex spasm may be sufficiently prolonged to cause an obstruction to the flow of bile, leading to jaundice Then, when the inflammatory process subsides, the spastic sphincter relaxes, and a normal flow of bile ensues In the meantime, the temporary obstruction has caused some dilatation of the common duct Repeated episodes of this type could cause marked enlargement of the biliary tree and transient clinical jaundice without intraductal calculosis A dilated common duct is not an infrequent finding in the presence of a markedly fibrotic, clinically diseased gall bladder

Whenever a common duct is explored, T tube drainage is routinely instituted, the end of the tube being brought out through a right subcostal stab wound Choledochal drainage decompresses the duct, permits an appraisal of the daily secretion of bile, and, if necessary, an analysis of its contents from a chemical standpoint, especially for the presence of pancreatic ferments Before removing the T tube, a cholangiogram is done to insure choledochoduodenal patency and the absence of calculi, and, possibly, to visualize the pancreatic duct

The commonest postoperative complication is prolonged drainage from a subhepatic exudate, which almost invariably clears spontaneously Pulmonary complications such as pneumonia and atelectasis are next in importance, and a greater variety of complications are encountered only occasionally

There were three deaths in this series, of which at least two were unavoidable (cerebral hemorrhage and uremia) The third death was a case of secondary hemorrhage complicated by ileus

The mortality rate for these 568 cases is less than 0 5 per cent

We were especially interested in the ultimate follow-up of patients with a history of jaundice or the presence of jaundice at the time of operation, in whom the common duct was not explored There were 36 patients with a history of jaundice and 12 patients who were actually jaundiced at the time of operation The follow-up revealed that one patient developed recurrent colic necessitating re-exploration two years later, at which time the common duct contained gravel Another patient, in whom the common duct was so extremely narrow at the first operation that it could not be probed, returned two months later with an attack of acute pancreatitis and jaundice which subsided with medical treatment All other patients have remained well Among the 12 patients with actual jaundice at the time of operation, eight could be followed for a period up to eight years, and all have been perfectly well

The patient was seen once yearly in the neurology clinic. At the last visit on July 30, 1946, it was noted that the patient had been off quinine for one month and stated that he felt better when he was on the medication. The electrocardiogram still showed a left bundle branch block identical with the original tracing. There was weakness of the legs on walking. There was atrophy of the facial musculature, more on the lower part of the face. Otherwise the findings were as before.

No change in the cardiac status was found on follow-up in the cardiac clinic. Electrocardiograms taken on October 3, 1944, January 3, 1945, July 30, 1946, and January 29, 1947, were identical and revealed a left bundle branch block. The patient had never complained of precordial pain, dyspnea, or orthopnea, and there were never any signs of congestive failure. Fluoroscopy on January 29, 1947 revealed the heart to be normal in size, shape, and position.

A twenty-four hour collection of urine on February 23, 1947, on an unrestricted diet revealed a creatine content of 20 mg. A 17 ketosteroid done on March 4, 1947, was 16.7 mg. in twenty-four hours (normal —10–30 mg. in twenty-four hours). Ophthalmic examination on March 17, 1947, showed dustlike opacities in the lenses seen through the undilated pupil. The media were clear and the fundi normal. The ocular tension was unaffected by dilatation of the pupil.

Atropine sulfate, 2 mg., was given intravenously on three separate occasions to study the effect of this drug on the P-R interval, the ventricular rate and the tolerance of a patient with myotonia atrophica to atropine, as measured by the effect on salivation and on the pupils.

The effect on the ventricular rate is outlined in Table 1. The average change in rate for the three experiments was 20 beats per minute.

During the first study, some dryness of the mouth began twenty-five minutes after administration of the atropine. Dryness was complete after thirty-three minutes with a return of the ability to salivate after forty-four minutes. There was no effect on salivation in the other two studies. There was no effect on the pupils in any of the three observations.

The first two studies were carried out with commercially available hypodermic tablets of atropine sulfate. For the third study, a solution of atropine sulfate was specially prepared, and a chemical assay revealed that the recorded value of 0.4 mg. of atropine sulfate per 0.5 cc. was equal to 0.4029 mg. per 0.5 cc. in the chemical assay.

A further study of the effect of atropinization on the prolonged P-R interval in this patient was made. During the first study only standard limb leads were taken. After atropinization the P waves became so low as to be inconclusive for accurate measurement. Subsequent observations both by precordial chest leads and by use of the speed film (75 mm. per second) indicated no significant effect of atropinization of the P-R interval.

TABLE 1.—EFFECT OF ATROPINE SULFATE ON VENTRICULAR RATE OF A PATIENT WITH MYOTONIA ATROPHICA

Time of Observation (Minutes)	Ventricular Rate (Per Minute)		
	March 22 1947	April 19 1947	July 30 1947
Control	88	74	80
	(2 mg. atropine sulfate given intravenously)		
0.01	105	94	100
0.02	105	84	100
0.03	100	80	100
0.10	100	84	100
0.25	88*	80	104
0.40	100	**	92**

* Some dryness in mouth beginning at twenty-five minutes after injection of 2 mg. atropine sulfate intravenously; unable to salivate after thirty-three minutes. Salivation resumed after forty four minutes. No effect on the pupils.

** No effect on pupils or salivation after forty minutes of observation.

Discussion

Evans, in 1944, clinically examined the hearts of 13 patients with myotonia atrophica and found the following: pulse is often small and the blood pressure sometimes low. The first heart sound in the mitral area may be split. The electrocardiogram shows prolongation of the P-R interval, low voltage of the P wave, slurring of the QRS, and left axis deviation. The size of the heart may be normal or may appear small, but in the presence of considerable lengthening of the P-R interval, moderate enlargement may take place.[7]

The findings of other authors are listed in Table 2.[2-9] The characteristic cardiovascular findings include hypotension, prolonged P-R interval, bradycardia, and occasionally prolonged QRS interval. Of the 47 cases summarized from the literature, 26 (55 per cent) had a prolonged P-R interval (0.20 second or longer), 16 (34 per cent) showed bradycardia (60 beats per minute or slower), 6 (13 per cent) had hypotension (systolic pressure of 100 mm. Hg or lower), and 3 (8 per cent) had a prolonged QRS interval (0.12 second or longer).

Atropinization.—Ask-Upmark ascribed the bradycardia and prolonged P-R interval to an abundant effect of the "vagus substance," acetylcholine, and felt that quinine acts by inhibiting acetylcholine at the myoneural junction.[9]

TABLE 2.—CARDIOVASCULAR ABNORMALITIES IN MYOTONIA ATROPHICA

THE HEART IN MYOTONIA ATROPHICA

SEYMOUR H RINZLER, M D , New York City

(From the Cardiovascular Research Unit of Beth Israel Hospital)

MYOTONIA atrophica is a disease of muscle, usually beginning in the third decade of life, which is characterized by coincident wasting and weakness of muscles The muscles usually involved are the facial, the sternocleidomastoids, the forearm and small hand muscles, and the vasti and anterior tibial dorsiflexor muscles of the lower extremity Curschmann pointed out the many extramuscular manifestations of the disease, such as lens opacities, frontal baldness, low basal metabolic rate with elevation of blood cholesterol, and in males, testicular atrophy [1] In recent years both cardiac and gastrointestinal manifestations have been noted [2–9]

Our interest in the heart in myotonia atrophica was stimulated by the discovery in the cardiac clinic of a patient with this skeletal muscle disease and an abnormal electrocardiogram showing a prolonged P-R interval (0 24 second) and left discordant bundle branch block of unknown cause (Fig 1)

Case Report

M L , a forty-two-year-old clerk, was admitted to the hospital on August 7, 1944, because of a first attack of three days duration of pain in the right calf on walking During the five years before admission, the patient began to notice weakness of both legs, atrophy of the calf muscles, and a "heavy stepage" gait. He had difficulty in changing from a lying to sitting position and in straightening up after bending He had noted no particular weakness in the arms, no loss of balancing power, and no sensory disturbances

The physical examination revealed a well-developed and well-nourished white male in no acute distress, although giving an appearance of being chronically ill The skin showed a vitiligo of both feet and ankles There was baldness of the hair of the head The pupils reacted sluggishly to light and accommodation The left lid was lower than the right The eye grounds were normal The tongue deviated to the right, and there was mild atrophy of the papillae of the right side There was no lymphadenopathy The lungs were clear to percussion and auscultation The heart was not enlarged The sounds were distant The second pulmonic sound was split and was greater than the second aortic sound There was a soft systolic blow at the apex. The radial pulse and ventricular rates were equal at 72 beats per minute The blood pressure was 110/80. There was no enlargement of the liver or spleen and no peripheral edema. Muscular and neurologic examination revealed weakness of both orbicularis oculi, both sternocleidomastoid, both anterior tibial, and both quadriceps muscles. There was a thinning of both legs as well as the lower thirds of the thighs. There was a bilateral foot drop Knee jerks were normal, and ankle jerks were absent bilaterally The Babinski sign was negative There was no ataxia or sensory change The hands showed typical myotonic reactions in that the relaxation of the closed hand was unduly prolonged. The testes were atrophic

Laboratory Data —The red blood count was 4,950,000 cells per cu mm with 81 per cent hemoglobin The white blood count was 9,650 cells per cu mm. with 71 per cent polymorphonuclear leukocytes The urine examination was normal The fasting blood sugar was 83 mg per cent with a normal glucose tolerance test The nonprotein nitrogen was 38 mg per cent. The Wassermann was negative The basal metabolic rate was −25 per cent. A spinal tap revealed an initial pressure of 150 mm of water The terminal pressure after removal of 15 cc of fluid was 120 mm of water No cells were found. The glucose was 56 mg per cent, the total protein, 50 mg per cent, the chlorides, 610 mg per cent, and the Pandy plus minus The venous pressure was 9 5 cm water Blood chemistry revealed a sodium level of 373 3 mg per cent, potassium of 15 4 mg per cent, cholesterol 219 mg per cent, phosphatase (alkaline) 5 3 Bodansky units. The electrocardiogram showed a left discordant bundle branch block Oscillometric readings at the ankle were two at a blood pressure of 100 mm. Hg on the right side and 1¾ at the same manometric reading on the left Urine examination for creatine showed an excretion of 384 mg in twenty-four hours (normal—0 to 50 mg in twenty-four hours) [10]

Course —A diagnosis of myotonia atrophica and left bundle branch block of unknown etiology was made The patient was started on quinine, 0 3 Gm three times daily, and Vitamin B complex At physiotherapy, the reaction of both flexor and extensor muscles of the legs to faradic current was slow, and the relaxation was very long and gradual instead of sudden as in the normal muscle Reaction to galvanic current was normal, indicating that there was no nerve involvement The pain in the right calf disappeared within two weeks of admission, and the patient was discharged improved to the neurology and cardiac clinics on September 7, 1944.

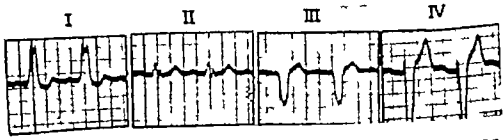

FIG 1 Electrocardiogram taken January 29 1947, showing P-R interval of 0 24 second and left bundle branch block. This record is similar to those taken on October 3, 1944, January 3, 1945 and July 30, 1946

STANDARDS FOR CARE OF CHRONICALLY ILL

A P Merrill, M D , New York City

(From the St Barnabas Hospital for Chronic Diseases)

IN A PROGRAM for integrated hospital care the patient with chronic disease deserves special consideration Although the neglected stepchild of organized medical and health efforts in the past, he can no longer be relegated to a minor role, for chronic disease causes three times more disability than acute illness and blights the life of every fifth inhabitant of the United States (Table 1) [1] The problem of chronic disease is almost as challenging to our generation as the atomic bomb Adequate care of the chronic patient is the number one health problem of the nation.

TABLE 1 —Rates of Illness According to Several Measures in the United States*

Type of Information	Rate
Percentage of persons disabled on day of visit	4 4
Percentage of persons disabled for whole 12 months immediately preceding visit	1 2
Percentage of persons reported as having chronic disease or impairment	17 7
Illnesses disabling for 1 week or longer during 12 months immediately preceding visit (frequency per 1 000 persons)	
All illnesses	171 0
Acute	123 0
Chronic	48 0
Diseases	45 0
Impairments	2 9
Excluding persons disabled for whole period	159 0
Number of days of disability per person observed	
All illnesses	9 9
Acute	2 6

Chronic	154 0
Excluding persons disabled for whole period	36 0
Percentage of workers (15 to 64 years of age) who were reported to be unemployable by reason of disability	1 1

* Adapted from Reference 1

Half of the 25 million victims of chronic illness (177 per 1,000 population, or 17 7 per cent) are under the age of forty-five, and one in every six is under twenty-five [2] The million and a half complete invalids from chronic disease (10 8 per 1,000 population) cause the loss of a billion days a year from constructive pursuits [3] Medical science has conquered the ravages of acute infectious diseases and increased the life span of man 100 per cent, from twenty-nine years in ancient Grecian times to a level well over sixty years today In extending and saving life, however, medicine has created a new and serious problem, the patient with chronic illness—the cause of two thirds of our deaths today, compared with only one fifteenth seventy years ago Progress in the diagnosis and treatment of diseases of the long-term variety has not decreased the incidence of these illnesses (Table 2)

TABLE 2 —Estimate of Number of Americans Suffering from Chronic Diseases*

Disease	Number of Persons
Rheumatism and arthritis	6 500 000
Heart disease	5 000 000
Arteriosclerosis and high blood pressure	3 700 000
Hay fever and asthma	3 450 000
Persons crippled by infantile paralysis and other orthopedic diseases	2 600 000
Syphilis (rough estimate)	2 000 000
Hemorrhoids	2 000 000
Varicose veins	1 750 000
Chronic bronchitis	1 700 000
Nervous and mental diseases	1 450 000
Nephritis and other kidney diseases	1 550 000
Goiter and other thyroid ailments	1,200 000
Sinusitis	1 150 000
Cancer and other tumors	930 000
Diseases of female organs	720 000
Tuberculosis all forms	680 000
Diabetes mellitus	660 000
Diseases of gallbladder and liver	640 000
Ulcers of stomach and duodenum	330 000

* Based on figures compiled by George St J Perrott U S Public Health Service. The total is 23 000 000 because some Americans are afflicted with two or more chronic diseases (adapted from Reference 3)

An integrated and standardized program for chronic patients is nonexistent, as are order and logic in their care Some chronic patients are in nursing homes and homes for the aged not properly equipped for their care, others who should be in hospitals are at home, still others are in hospitals when they should be at home "The problem is twofold These patients need an increasing amount of professional and institutional care, and ways and means must be developed to provide that care "[4]

The report of the Commission on Hospital Care cites only 315 hospitals with but 51,861 beds for long-term patients in the United States, including convalescent, other than those for mental, tuberculous, and Federal civilian patients [4] When the latter three are included, however, they comprise 61 6 per cent of the total beds and 21 6 per cent of the nation's hospitals *

Read before the Forum on Special Problems at the 26th Annual American Hospital Standardization Conference of the American College of Surgeons New York City September 11 1947

* Total of 5 982 hospitals and 1 278 074 beds Short-term—4,691 hospitals or 78.4 per cent, 491 230 beds or 38.4 per cent long term—1 291 hospitals or 21 6 per cent, 786,844 beds or 61 6 per cent (American Hospital Directory 1946) [4]

Havier and Decourt found that intravenous administration of atropine sulfate (total dose 2 75 mg in doses of 1 mg , 0 75 mg , and 1 0 mg within nineteen minutes) to a patient with a heart rate of 64 beats per minute raised this rate to only 88 beats per minute [4] The P-R interval was 0 18 second before atropinization and was not affected Evans stated that intravenous atropine had no effect on the prolonged P-R interval in two patients in his series [7]

Administration of 2 mg of atropine sulfate intravenously to our patient likewise had no effect on the P-R interval The rationale for the use of this drug was suggested by Bruenn who studied the mechanism of impaired auriculoventricular conduction in acute rheumatic fever [11] Using 1 5 to 3 mg of atropine sulfate intravenously, he was able to reduce significantly a prolonged P-R interval in 20 of 22 patients In one of the two patients unaffected by atropine, impaired auriculoventricular conduction was found even a year after the study, and the patient was regarded as having structural damage to the junctional tissues of the heart as a result of the rheumatic lesion

The average increase in ventricular rate noted by Bruenn after atropinization was 26 4 beats per minute This figure is to be compared with the increase of 24 beats per minute in the case reported by Havier and Decourt and an average increase of 20 beats per minute in our patient

The minimal or absent effects of atropinization (2 mg intravenously) on the pupils and the process of salivation suggest some degree of tolerance to atropine sulfate of patients with myotonia atrophica Further study of this observation is contemplated

Quinine Sulfate—The question of whether quinine sulfate could produce a bundle branch block was raised This was based on the reports of Maynard and Viko, Marvin, and White which indicated that quinidine, another cinchona derivative, depresses intraventricular conduction and under some conditions produces bundle branch block [12 13] However, even after cessation of administration of quinine sulfate for one month, the electrocardiogram still showed a left bundle branch block The excretion of quinine given orally is almost complete within twenty-four hours [14 15]

Cardiac Involvement—It has been suggested that the myocardium might also be involved in the dystrophic process, but others hold that the changes observed clinically resembled those due to coronary sclerosis [2–4 6,16] There is no significant pathologic confirmation for either of these beliefs However, Bevans in a necropsy study of the hearts of four young patients (twenty, fourteen, eighteen, and sixteen years of age) with an allied muscular disorder, namely, progressive muscular dystrophy, found gross myocardial lesions which included increase and opacity of the myocardial fat, streaks of fibrosis throughout the myocardium, particularly in the left ventricle, and slight focal thickening of the endocardium [17] On microscopic examination the myocardial fibers showed changes similar, but not identical, to those in the skeletal muscles

Summary

A patient with myotonia atrophica and electrocardiographic evidence of prolonged P-R interval and left bundle branch block is presented

A tolerance in this chronic muscular disease to atropine sulfate is suggested by the minimal to absent response of the pupils and the process of salivation to intravenous administration of 2 mg of the drug

A review of the literature covering the involvement of the heart in myotonia atrophica is given The possibility that this represents another rare form of heart disease is offered

VALUE OF HORMONE CREAMS HIGHLY CONTROVERSIAL

The value of hormone creams as "skin rejuvenators" is highly controversial, points out Maxine Block, Hollywood, California, in *Hygeia*, health magazine of the American Medical Association Writing in the March issue of the magazine, Mrs. Block emphasizes that, although the relation of cancer to sex hormones is still a laboratory problem, tests on animals showed that there is some danger that the hormones may cause malignancy—*J A M A , February 25, 1949*

Improvement and standardization of medical and nursing procedures in the care of the long-term patient are greatly needed Chronic institutions usually lack a sufficient and competent staff, professional and nonprofessional Accommodations for patients, and facilities for diagnosis and treatment are inadequate The medical and nursing needs challenge the highest type of skill which these professions are able to render The combination in one patient of confinement to bed because of serious disease, together with incontinence and inability to feed himself, presents an overwhelming problem in prevention of bedsores and general deterioration

The type and quality of medical care required by chronic patients differ little from those needed by patients afflicted with acute illness Every diagnostic and therapeutic facility existing in the general hospital should be available to the chronic patient In addition, special features should be provided, such as bedside radios and diversional activities, together with rehabilitation programs

Rehabilitation methods learned from World War II are beginning to be applied to the civilian population which includes a much larger number of chronically diseased and handicapped persons than were disabled as a result of the war, by a ratio of at least 5 to 1 [8] Technics of physical, mental, and vocational rehabilitation have a wider field of application in the chronic hospital than has been suspected This is a hopeful prospect for chronic patients, particularly those in the younger age group, under forty-five years, who comprise half of the total twenty-five million victims in the nation today

General hospitals usually lack sufficient solaria, balconies for sunshine, adequate gardens and grounds, and other recreational facilities essential to the long-term patient, throughout the country as a whole these desirable features are not, unfortunately, available to chronic patients The special chronic hospital, new in construction and designed with these particular facilities, is needed, especially in large cities Special hospitals thus established should be self-sustaining, embracing all the facilities and services now customarily thought of in connection with general hospitals, or should be affiliated so that there is no lack of complete professional and auxiliary benefits

Various public welfare and health organizations should strive to improve services available to chronic patients being cared for in private and nursing homes Affiliation between general hospitals and nursing homes raises standards of care in the latter Plans have been advanced for physicians and nurses to care for these patients in their own homes It is unfortunate that in many county homes, homes for the aged, and similar institutions, insufficient emphasis is placed on individual care needed by many of these patients These institutions, however, may well serve those patients who require only domiciliary care, yet they too should be affiliated closely with a general hospital [4]

One obstacle in providing adequate hospital service for patients with chronic disease is the almost prohibitive cost involved. Ordinarily, the chronic patient already has been in and out of several general hospitals so that his funds, as well as those of his family and relatives, are exhausted The per diem cost for care of the long-term patient, however, is generally about half to two-thirds of that for the acutely ill This is true whether long-term patients are cared for in a separate unit of a general hospital or in a self-contained chronic hospital Many of our chronic hospitals are supported by taxation, others are sponsored by private philanthropy The community and other governmental agencies should provide for long-term patients unable to pay cost of care in general hospitals or in other specialized institutions

A solution can reasonably be expected for many of the problems of aging and of degenerative diseases when investigation in the basic sciences is encouraged by further hospitalization of patients with long-term illnesses New technics and methods of therapy will be developed more quickly and their use made better known through such efforts The primary difference between the long- and the short-term patient is the amount of special service required and the average length of stay in hospitals Hospitalization of patients affords the best opportunity for study and research to mitigate present undesirable results and reduce the incidence of chronic diseases.

Medical teaching should take cognizance of this changed emphasis in disease incidence, medical students, interns, residents, and practitioners of medicine should receive proper instruction in diagnosis and therapy of chronic degenerative diseases in early and advanced stages Ample material is available for undergraduate and graduate teaching, and affiliations with medical schools should be developed with this goal in mind. Physicians, medical and nursing students, and registered nurses should have opportunity for firsthand study of all aspects of chronic illnesses through adequate hospitalization of long-term patients

Since the problems of chronic disease and the aging process are so diverse and of such far-reaching consequence, it is felt that a national commission on chronic diseases should be established, including wide representation from both professional and consumer groups, with the thought of giving more thorough study to the problem, out of which may come recommenda-

A large number of beds for chronic patients are in nursing homes which are neither members of the American Hospital Association nor registered by the American Medical Association Albeit such institutions provide considerable service, they are, for the most part, of small capacity and provide inadequate general care General hospitals, on the other hand, often allot beds for use of chronic patients, their quality of care usually is good

It should be stressed that not only is there need for regulation of nursing homes and other institutions for the care of the chronically ill to guarantee better quality of care and patient-safety, but there is urgent need for further development of hospital care A considerable number of such new extensions could be attached to already existing general hospitals, thus improving continuity and integration of medical and hospital service by close physical proximity This principle is especially applicable to small communities where general hospitals have not exceeded optimal size for efficient and economic operation, as perhaps is the situation in some of the large urban centers

On the other hand, the special hospital for chronic diseases is adapted particularly to the health and medical needs of urban communities Therefore, construction of special hospitals of the long-term variety seems indicated in large cities in order to meet community needs for the chronic sick where population exceeds 100,000

Two beds per 1,000 population are recommended by public health authorities as the minimum number for adequate hospital care of chronic patients [5] On this basis 280,000 beds for long-term patients, five and one-half times more than now available, would be required for the country as a whole It has been suggested that over 50 per cent of these beds would be required for patients needing active medical care The remaining 50 per cent, or one bed per 1,000, would be for patients needing custodial care but under medical supervision [6] However, in view of recent developments in the technics of rehabilitation and hospital care of patients with chronic disease, I am of the opinion that all of the two beds per 1,000 population will be needed for active hospital care, especially in view of the large number of long-term patients now being cared for in general hospitals

In addition, there is need for two and one-half beds per 1,000 population for the chronically ill in related institutions of high quality, which would comprise beds in nursing homes, homes for the aged, convalescent homes, infirmaries, supervised boarding homes, and other related institutions Accurate statistics have not been secured as to the total number of beds available for chronic patients throughout the United States in related institutions These needs should be determined by adequate surveys

In summary, the estimated minimum need for beds in hospitals and related institutions of high quality for the chronically ill is four and one-half beds per 1,000 population, including two beds per 1,000 for hospital care and two and one-half beds per 1,000 for custodial care in the related type institution [7]

Of the one and a half million persons (10 8 per 1,000 population) in the nation disabled for ove a year from chronic illness, about 42 per cent, o 630,000 would benefit from medical care in hospital or related-type institution (Fig 1) This is based on the need of four and one-hal beds per 1,000 population, or a total of 630,00 beds, for the care of chronic patients in hospital and related-type institutions Forty-four and four-tenths per cent of these, or 280,000 persons, would benefit from active medical attention, the remainder requiring mostly custodial care under medical supervision Therefore, all the 280,000 hospital beds recommended for the nation for patients with chronic disease should be used for active medical treatment, and the other 350,000 beds should be restricted to custodial care of long-term patients under medical supervision in related-type institutions of high quality

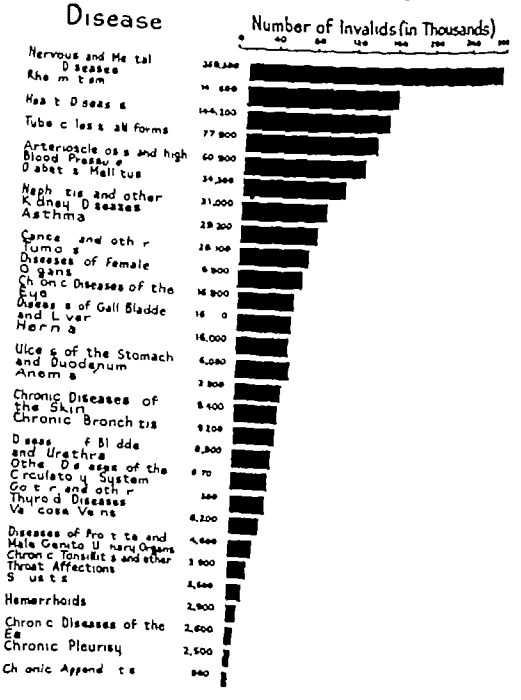

FIG 1 Estimated number of invalids disabled from specified chronic diseases in the United States in 1937 (adapted from Reference 3)

THE USE AND ABUSE OF THE ANTITHYROID DRUGS

BERNARD J FICARRA, M D , Brooklyn, New York
(From the Department of Surgery, St Peter's Hospital)

THE frequent reference in the current medical and surgical literature to the utilization of the thiourea group of drugs in hyperthyroidism has produced confusion This confusion has resulted in an erroneous interpretation of the value and usage of the antithyroid drugs In addition to the confusion that reigns, a hidden antagonism exists between the internist and the surgeon Often the internist is of the opinion that thiouracil, thiobarbital, or propyl thiouracil will obviate the need for thyroidectomy The surgeon, on the other hand, opposes the medical treatment of hyperthyroidism without thought to an eventual surgical procedure A clear understanding of the use of the antithyroid drugs will not only eradicate the animosity between surgeon and internist but will also establish a pattern for the rational management of patients with thyroid disease

As a preamble, it must be admitted that the final word in the treatment of thyroid disease has not been written The antithyroid drugs have been a great contribution in the management of the hyperthyroid patient However, in view of the fact that the fundamental cause of hyperthyroidism is not known and since it cannot be determined whether or not the thiourea group of drugs affect this causative factor, these drugs cannot be accepted as specific remedial agents for hyperthyroidism This belief is further substantiated by the known fact that other glands have enlarged when the thiourea drugs have been administered Enlargements of the salivary gland and the pancreas have been reported [1] Therefore, these drugs cannot be classified as specific agents acting solely on the thyroid gland

Notwithstanding our incomplete knowledge, the use of the antithyroid drugs has found a definite place in the management of hyperthyroidism These drugs are thiouracil, thiobarbital, and propyl thiouracil Of the three drugs, propyl thiouracil has the widest range of safety The lowest incidence of toxicity is recorded following its use The maximum therapeutic efficiency of this drug is obtained by administering it in a 200-mg daily dose [1]

This drug, when administered over a sufficient length of time, will cause an elevated basal metabolic rate to return to normal Generally speaking, the drug must be administered for the same number of days that the basal metabolism is elevated Thus, a basal metabolism rate of 50 would indicate that propyl thiouracil would be given for approximately fifty days with a daily dosage of 200 mg

The next question to answer concerns the type of hyperthyroid patient that should receive the drug It is universally agreed that toxic hyperthyroid patients should receive the drug The diversity of opinion commences after the above question has been answered Some internists believe that they should treat the patient medically without operation Surgeons, on the other hand, advocate the use of propyl thiouracil as a preoperative drug to prepare the patient for thyroidectomy

As a surgeon, I would agree to the medical treatment of primary hyperthyroidism with propyl thiouracil in only one type of patient This would be a patient having mild hyperthyroidism with a small thyroid gland In this instance medical treatment would be allowed for one year After that time if there was not sufficient improvement, surgery could be recommended It is common knowledge that the antithyroid drugs have the ability to produce a long period of remission in hyperthyroidism [1] Lugol's iodine without propyl thiouracil may sometimes result in the same type of recrudescence Therefore, propyl thiouracil is not needed in many cases

The surgeon believes that the present low mortality in thyroid surgery warrants thyroidectomy in almost all instances of hyperthyroidism The surgeon's attitude is strengthened when one considers the deleterious effects resulting from the prolonged use of the thiourea drugs These noxious effects may be termed abuses, for, while the drug is expected to do one task, its actions may be more harmful than was suspected at the beginning The abuses may be as follows

1 Myxedema may be produced
2 There is danger of laryngeal edema in the resulting hypothyroid state
3 The underlying pathology is not eradicated by these drugs
4 Enlargement of other glands, as the salivary glands or the pancreas, may occur
5 There is a possibility of instituting malignant degeneration in the thyroid gland
6 The gland does not decrease in size

First, the use of the antithyroid drugs produces such a remarkable lowering of the basal metabolic rate that the prescriber may become too enthusiastic If the drug is given in sufficient doses over a long period of time, the synthesis of thyroxin may be inhibited The basal metabolic rate continues to fall When the available cir-

ther voluntary efforts as well as gov-
upport
ge and an opportunity face the general as well as the chronic hospitals of today in application of modern scientific and medical discoveries to the field of long-term illness The success which these objectives may attain will depend largely upon the vision and foresight manifested by progressive hospital administrators, boards of trustees, and the medical and nursing professions in mobilizing community resources in support of these deserving endeavors on behalf of long-suffering patients with chronic sickness

Freedom from disease must be included among our immediate goals, aided through an adequate plan of integrated hospital service for the chronically ill Our aim should not only be to add years to life but life to the years

URGES AWAKENING TO THREAT OF SOCIALISM

Business and professional people must abandon their comfortable belief that socialization of medicine and other professions and industry "can't happen here," Dr Ernest E Irons, Chicago, president-elect of the American Medical Association, told members of the Woman's Auxiliary of the Chicago Medical Society on Tuesday, March 8

"I urge you to take this present threat to America and our free institutions seriously This is a fight to prevent the importation of a ruinous socialism, which developed and has repeatedly failed in Europe, into our up-to-now free America," Dr Irons said

"Among Federal Security Administrator Oscar Ewing's allegations in justification of taking over the medical care of the American people is the charge that the physicians as represented by the American Medical Association have no program, or, if they have, it has worked so badly that we as a nation are about to fall to pieces. The fact is that we enjoy the best health and the best medical care of any nation on earth," he said

"In support of his demand for political medicine, Mr Ewing quotes draft statistics which have been cunningly misstated by those who consistently have been attempting to undermine our government. Selective service statistics are mishandled by assuming that the percentage of total rejections represented a cross section of the entire male population subject to draft The fact is that before the draft there were removed from the group 2,700,000 acceptable men who enlisted voluntarily

"Another 35 5 per cent were deferred for essential occupation or dependency Ten million of the remainder were examined from December 7, 1941, to December 31, 1943, 3,600,000 were rejected. Of these rejections, 21 7 per cent were rejected for illiteracy, mental deficiency, and venereal disease, 43 26 per cent for mental disease, defective heart ailments, amputations—a total of almost two thirds of all rejections

"By most liberal estimates only about 20 per cent of the rejections were for preventable disease. Political medicine will not cure flat feet or illiteracy

"Glowing promises are made by Mr Ewing of complete over-all medical care No mention is made of the certainty of the deterioration of quality of care which inevitably will follow a system administered by governmental regimentation, and which has always followed in nations where compulsory sickness insurance has been tried

"A payroll tax of 1½ per cent is suggested in present discussion, but even proponents of the plan admit that this tax will quickly rise to 4 per cent and eventually to 9 per cent and more For sales purposes to the people, the cost of administering compulsory medicine is now estimated between three and four billion dollars per year, the real fact is that the cost will rise from six billion to 18 billion per year

"On the basis of German experience, there will be added to the government employes 1,500,000 more payrollers The worker already parts with 20 to 30 per cent of his wages through hidden and payroll taxes, and compulsory medicine will take still more from him for a service of dubious quality

"In this fight for preservation of our freedom in medicine and the preservation of American democracy, there can be no compromise We are either for or against socialization of medicine and the socialization of America, either black or white There can be no gray"

THE PRESERVATION OF THROMBOPLASTIN SUSPENSIONS IN THE FROZEN STATE

ROBERT D BARNARD, M D , GEORGE B GORDON, M D , and HERBERT A WEITZNER, M D ,
Brooklyn, New York

THE general extension of dicumarol therapy in thrombotic and thromboembolic conditions to institutions smaller than general hospitals has been hampered by trepidation over the results of prothrombin time determination tests While bedside tests have been devised, the lack of unanimity as to the normal prothrombin "time" and the possibly justifiable insistence on a report in prothrombin "percentage" has discouraged many physicians from employing dicumarol [1]

The main difficulty in prothrombin testing has centered around the supposed variability of thromboplastin preparations As Quick has pointed out, there are many procedures more tedious than rabbit brain thromboplastin preparation at which the laboratorian does not balk, and he advocates that each laboratory make its own thromboplastin [2] Two excellent preparations of dried rabbit brain (Difco and Maltine) are universally available and have been used by the writers These should have solved the problem, but even in large and active institutions the quality of the prothrombin reports continues to aggravate both clinical and laboratory staffs In the small hospital or commercial laboratory it is not uncommon to find a single test done daily, necessitating daily thromboplastin suspension preparation and inactivation. This is a procedure taking far more time than the simple execution of the test proper, and afterwards the bulk of the thromboplastin must be discarded

Actually, the hazards encountered in prothrombin testing are seldom the fault of the thromboplastin preparation Every described method of prothrombin determination evinces a progressive series of technical fallacies which start off at the time of blood collection and end with the recording of the result There are uncontrollable variables in every procedure whose limits far exceed what is purported to be the unreliability of commercial thromboplastin Attempts to reduce some of these errors were incorporated in a method recently described which embodied (*a*) Vacutainer collection through a paraffined needle, (*b*) use of Russell viper venom thromboplastin, and (*c*) recording as end points the time of appearance of both filar and gelatinous fibrin components of the clot [3]

In spite of the criticisms directed against its use the writers feel that viper venom (Stypven, Burroughs Wellcome & Co) is an excellent thromboplastin for use in prothrombin determinations both in small and large laboratories [4,5] Unfortunately, it has been available only sporadically for the past two years While we were attempting to prepare a comparable transparent thromboplastin from rabbit brain by alternately freezing and thawing the suspensions to "crack" them, a preparation, inadvertently left in the freezing compartment for several weeks, was found to have thromboplastic activity comparable to the freshly prepared material Repeated freezing and thawing of rabbit brain thromboplastin suspensions does not affect its activity Thawing of such suspensions is rapid at room temperature Since the material remaining after the conduct of a single test may again be frozen and preserved, it fills the needs of the occasional user Its preparation and use is described *

Preparation of Suspension

Three hundred milligrams of acetone-dried rabbit or human brain are placed in a dry, 15-cc conical tipped centrifuge tube, 2 5 cc of 0 9 per cent sodium chloride solution added, and the contents inactivated at 45 C for about ten minutes, the particulate material being macerated in the fluid during this time with a glass rod [3] The tube is immediately transferred to the freezing compartment of a refrigerator until frozen solid, and then allowed to thaw at room temperature Alternate freezings and thawings are repeated three times The particulate matter should now have completely settled, leaving a slightly opalescent supernatant liquid which is ready for use Laboratories conducting large numbers of tests will find it convenient to prepare multiple tubes at the same time, it is not convenient to prepare larger samples in a single tube because of the time required for thawing

Conduct of the Test

Blood is obtained either in a citrate solution moistened 10-cc Luer syringe or in the Vacutainer tube with special citrate anticoagulant, which has the advantage of being used for other blood studies [9,10] The erythrocytes should be allowed to settle but not the platelets as they yield an

* Warner and Smith and their coworkers advocate the storage of brain extract in small vials contents are kept frozen from the time of preparation until use and the excess is then discarded.[4,7] They also find that thromboplastin suspensions retain their potency even in the unfrozen state *if* kept at ice box temperature. Our findings which contradict the reputed lability of thromboplastin suspensions conform to theirs

culating thyroxin has been exhausted, myxedema may result This myxedematous state will persist as long as the thiourea drug is administered

Second, if operation is contemplated when the patient is in a state of myxedema, the possibility of postoperative laryngeal edema must be considered This edema, plus myxedematous infiltration of the larynx and vocal cords, may cause respiratory distress Under this circumstance a tracheotomy may be necessary [2]

Third, it must be remembered that the antithyroid drugs do not eradicate the underlying pathology Histologically, the glandular hyperplasia which institutes hyperthyroidism remains This hyperplasia persists even though the basal metabolic rate may be normal [1]

Fourth, excessive administration of these drugs is known to have caused salivary glandular enlargement and pancreatic hyperplasia [1] Other organs may be similarly affected, but up to the present time such findings have not been detected The evil effects of this type of enlargement may or may not institute malignant changes as it does to the thyroid gland itself

Fifth, evidence has been offered that malignant changes can occur in the thyroid gland if the drug is administered too long This is especially true in patients with adenomatous goiters One case has been reported from Norfolk, Virginia, in which the surgeon definitely believes that carcinoma has been produced in a thyroid adenoma because of thiouracil [3]

Finally, the thyroid gland remains hyperplastic following administration of these drugs The gland does not decrease in size and may even increase in size Failure of the gland to diminish in size, plus the histologic evidence of hyperplasia, argues against the belief that these agents will permanently cure hyperthyroidism

Conclusions

1 An evaluation is made concerning the uses of and the abuses resulting from the excessive use of the antithyroid drugs

2 With the experience of others, as revealed in the literature, it may be proper to assume that the thiourea group of drugs cannot be considered as offering a permanent cure for severe hyperthyroidism

3 The dangers resulting from a prolonged administration of these drugs have been mentioned

4 The low mortality of thyroidectomy argues for surgical intervention in severe primary hyperthyroidism, adenomatous goiter with secondary hyperthyroidism, and thyroid adenoma

5 The use of the antithyroid drugs in the preoperative preparation of the thyroid patient may be considered as one of the most beneficial therapeutic contributions to the modern advancement of the study of thyroid disease

A M.A PROVIDES $25,000 TO SET UP CHRONIC ILLNESS COMMISSION

Carrying out another of the objectives of the American Medical Association's 12-point program for the advancement of medicine and public health, the Board of Trustees of the A M A has made available $25,000 to set up the Commission on Chronic Illness The sum, drawn from the A M A 's national education campaign fund, was allotted to the Interim Commission on Chronic Illness, which will set up the permanent commission

A conservative estimate suggests that more than one sixth of the population is afflicted with some chronic disease. Approximately 2,000,000 persons in the United States are chronic invalids at the present time, and the number is steadily increasing

The commission is a joint project of the A.M A , the American Hospital Association, the American Public Health Association, and the American Public Welfare Association, and was recommended by the Section on Chronic Disease of the National Health Assembly Dr James R Miller, Hartford, Connecticut, member of the Board of Trustees of the A M A , is chairman of the Interim Commission and will be a member of the permanent commission Other members of the Interim Commission, all of whom will be among the members of the permanent commission of approximately 30, are Dr Thomas A McGoldrick, Brooklyn, New York, representing the A M A , Dr Albert Snoke, New Haven, Connecticut, and J Douglas Colman, executive director, Maryland Hospital Service, Baltimore, representing the A H A , Dr Dean W Roberts, chief, Bureau of Medical Service, Maryland State Health Department, Baltimore, and Dr Edward S Rogers, of the Public Health School, University of California, Berkeley, representing the A P H A

This coordinated effort in the field of chronic illness is an excellent example of constructive cooperation between public and private agencies in answering one of the greatest and most acute of all social needs.—*J A M.A , February 25, 1949*

THE SYMPTOMATIC TREATMENT OF ALLERGIC DISEASES WITH NEOANTERGAN*

EMANUEL SCHWARTZ, M D , F A C P , LOUIS LEVIN, M D , and I MAXWELL KURTZ, M D , Brooklyn, New York

(From the Division of Allergy of the Department of Medicine, Long Island College Hospital)

THE concept of allergy originated when the similarity between anaphylaxis and the symptoms of hay fever and asthma was recognized It would be repetitious to go into too much detail as to what constitutes the allergotoxin which is liberated during an antigen-antibody reaction in an allergic individual That this allergotoxin is histamine, at least in part, has been fairly well established A brief review of the literature would perhaps be in order Dale argued that histamine was probably the cause of anaphylaxis, since the symptoms produced in the experimental animal by histamine and anaphylaxis were similar [1] The work of Best, Dale, Dudley, and Thorpe showed that normal living cells contained histamine [2] Thus an explanation for the source of histamine in the phenomenon of anaphylaxis was offered The studies of Lewis and Grant in the blood vessels of the human skin led them to believe that, as a result of irritation, a histamine-like substance was released from living cells [3] Dragstedt demonstrated that histamine is liberated during anaphylaxis [4 5]

Any drug that would tend to neutralize the effects of this liberated histamine in an allergic reaction would be of value The original antihistaminic drugs did just this, but their great drawback was that they were too toxic Among these early antihistaminic compounds were those prepared by Fourneau and Bovet in 1933, Staub and Bovet in 1937, and Staub in 1939 [6–8] All of these had excellent antihistaminic properties, but they were all too toxic for clinical use Thus, a search has been going on for better antihistaminic drugs that would have even greater histamine antagonistic properties and less toxic reactions.

By now it has been well established that there are a whole series of new drugs which have antihistaminic properties The recent literature contains many articles on animal experimentation with these histamine antagonists They all protect experimental animals against histamine shock and to a great degree against anaphylactic shock. Many of these compounds have been tried clinically and found useful in alleviating the various allergic symptoms in humans

In spite of the splendid antihistaminic and antianaphylactic properties of these drugs in experimental animals, the ultimate criterion is their clinical effectiveness in man, especially with regard to their symptom-relieving effect and to their degree of undesirable side reactions With this in mind an attempt is made to evaluate the clinical potency of one of these newer histamine antagonists, Neoantergan (N-*p*-Methoxybenzyl-N',N'-dimethyl-N-*a*-pyridylethylenediamine maleate)

In 1942, Halpern described his results with a new series of substances, the most active of which were called 2325RP and 2339RP [9 10] The latter was named, "Antergan," and found to be much more specific against histamine than any previously discovered compound More recently, a new ethylenediamine derivative was described by Bovet and his associates [11] This substance, called Neoantergan by the manufacturers, is claimed to be even more effective and much less toxic than Antergan Bronchospasm induced in guinea pigs and depression of blood pressure elicited in dogs by the injection of histamine or histamine liberated in anaphylaxis are readily prevented or diminished by Neoantergan. Sherrod and his coworkers found that the potency of Neoantergan in counteracting histamine bronchoconstriction exceeded Benadryl and Pyribenzamine twenty and four times, respectively [12] Winter showed that Neoantergan had the highest order of antihistaminic potency against intravenous histamine, histamine aerosol, and on intestinal strips against histamine in vitro [13] Side reactions were less noticeable after Neoantergan Feinberg and his associates found that Neoantergan (1) has potent antihistaminic and antianaphylactic activity in guinea pigs, (2) was of benefit to 39 of 60 patients (65 per cent) in hay fever, (3) benefited eight of ten patients in perennial vasomotor rhinitis, and (4) gave symptomatic relief to one of five patients with asthma [14] Arbesman described results with Neoantergan as follows In extrinsic allergic rhinitis the drug was of benefit to 63 per cent of 208 cases, in extrinsic bronchial asthma to 43 per cent of 69 cases The incidence of side-effects was 33 per cent of 247 cases [15]

Personal Observations

In our study Neoantergan was given to a series of 141 patients suffering from various

* Furnished through the courtesy of Merck & Co Inc.

increment of thromboplastin to the reaction mixture One-tenth cubic centimeter of plasma is transferred to a conical-tipped centrifuge tube (these are more easily handled than the Kahn tubes ordinarily used) whose bottom is immersed in a beaker of water at 35 to 38 C , 0 1 cc of thromboplastin is added, and before thirty seconds have elapsed, 0 1 cc of 0 025 molar calcium chloride solution is added On the latter addition, which is blown in from a 0 1-cc pipet, the timer is started The tube is kept immersed and in gentle motion within the glass beaker water bath which permits visualization of the end point The latter should be taken as the time of sudden opacification which may precede the appearance of a reticulum (filar fibrin) by a second The last stage of the clotting process is gelatinization In normal plasmas the entire process of coagulation, from opacification to gelatinization, occupies about two seconds Where a longer interval obtains (as during dicumarol therapy or induced or autochthonous hyperheparinemia), the fact should be noted on the report of the test

Prothrombin times on normal, human, citrated plasma by this procedure and with this thromboplastin preparation vary from ten and a half to thirteen and a half seconds With oxalated plasmas the prothrombin times averaged about one second longer The thromboplastin suspension described is applicable to Quick's procedure with oxalated plasma, but we have abandoned oxalate collection because the two successive crops of calcium oxalate crystals formed (one on blood sample collection and one on recalcification) absorb appreciable, if variable, amounts of prothrombin [11 12] The opacity of the recalcified oxalated plasma also vitiates the use of opacification as an end point and does not permit scrutiny of the amount of filar fibrin in the reaction mixture It is a distinct impression, although not as yet proved, that this reticulum is increased in amount in thrombotic and hypercoagulability states This information may be of value to the clinician

It is also advocated as part of the prothrombin determination that the tubes in which the tests have been performed be capped and placed in the incubator overnight It has been found in some instances that the clots formed by the test will undergo spontaneous liquefaction (fibrinolysis) and that such liquefaction appears to be accelerated in subjects receiving dicumarol [3] Whereas the rate of fibrinolysis appears to be related inversely to the thrombin concentration of the plasma, there is a direct relationship between the clinical progress of the patient and the rate of fibrinolysis It appears that many such subjects will continue to show increased fibrinolysis rates even though the prothrombin concentration is rising because of discontinuance of dicumarol therapy [12] It is believed the reporting of the presence or absence of fibrinolysis may be of value to the clinician

The collection of blood samples in dry oxalate for prothrombin testing is not advocated Contact with the powdered material imitates the prothrombin-thrombin conversion before coagulation is arrested by solution of the oxalate and before the conversion is intended in the test proper This premature conversion may explain many of the encountered instances of abnormally short "normal" prothrombin times which have served as an additional mental or psychologic hazard in anti-coagulant therapy

Summary

The preparation of a clarified thromboplastin suspension, conservable in the frozen stage, is described along with notes on its application to the prothrombin time determination of blood plasma

A portion of the experimental work upon which this report is based was executed on the laboratory services of the Halloran General Hospital Staten Island and the Veterans Administration Hospital Batavia.

ARE YOU PLANNING TO ATTEND THE ANNUAL CONVENTION OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK, MAY 2 TO 6, 1949, HOTEL STATLER, BUFFALO?

SINOAURICULAR BIGEMINY

MILTON SCHLACHMAN, M D , Corona, New York

(From the Department of Medicine, New York Medical College, Metropolitan Hospital Service)

UP TO the present the medical literature contains but few references to extrasystoles originating in the sinoauricular node, and none of the more popular and standard textbooks on electrocardiography discuss or illustrate this arrhythmia.[1-6] This would seem to indicate that premature systoles of sinoauricular origin are extremely rare or that the arrhythmia has been overlooked because it simulates other arrhythmias so closely as to be wrongly diagnosed That this disturbance is not too common may be explained by the fact that the farther away the extrasystolic center is from the chief centers in the heart, the more common are the extrasystoles Thus, ventricular extrasystoles originating in the deeper specific tissue are most common, and those coming above the bifurcation of the common bundle are rarer, as are those originating in the auricular-ventricular node

This arrhythmia must be differentiated from a sinus arrhythmia, a 3 2 heart block, premature auricular systoles originating near the sinoauricular node, and a sinoauricular block. An important diagnostic point which was originally expressed by Lewis and Wenckebach and emphasized in subsequent reports is that the returning cycle following the extrasystole should be no longer and may be shorter than the normal cycle.[1,6]

The resemblance of this condition to a respiratory arrhythmia is so great that one may suspect that many cases of sinoauricular extrasystoles have been misinterpreted as a respiratory arrhythmia. As the premature beat originates in the sinoauricular node, the configuration of the P waves is exactly that of the normal sinus beat However, Scherf has pointed out that deformation of a normal sinus P wave may occur as a result of a change in the intra-auricular conduction, and Langendorf and Mintz report a case of sinoauricular premature beats in which the P waves are slightly different from the normal sinus P waves.[4,5]

The following case is being reported because of the rarity of the condition and because a probable causative factor is indicated.

Case Report

The patient was a fifty-six-year-old Puerto Rican cook who had been in this country for twenty-four years. He was admitted to the hospital on March 1, 1947, with the chief complaints of loss of the sense of smell for the past year, dyspnea on stair climbing in the past six months, difficulty in swallowing of three months duration, weakness in the legs of three weeks duration, and a loss of 10 pounds in the past three weeks

History

The present illness dated back three years when, every morning on awakening, he experienced sharp epigastric pain which was relieved by eating The bowel habits had been regular until three weeks previously when a diarrhea of three to four stools daily occurred This diarrhea was not characteristic and contained no evidence of upper or lower gastrointestinal bleeding One year ago there was a sudden anosmia For the past three months, food had seemed to stick in his throat and move down slowly However, there was no dysphagia, nausea, or vomiting A poor appetite had been present for the past month and was associated with a great weakness and loss of 10 pounds Shortness of breath on climbing two flights of stairs had been noted in the past six months There was no history of paresthesia or anesthesia The past history revealed syphilis in 1922 for which he was treated in Puerto Rico

Physical Examination

Examination revealed a poorly nourished male who appeared chronically ill The pupils reacted sluggishly to light and accommodation, the conjunctivae were pale and the sclera slightly jaundiced

The tongue was smooth and reddened No lymphadenopathy was noted The lungs were normal The heart was normal except for an arrhythmia which gave the impression of a bigeminy The blood pressure was 115/65 The abdomen revealed no palpable organs or masses The reflexes were normal and vibratory sense was intact

Laboratory Examination

The following data were revealed The red blood cells numbered 1,630,000 on admission with a hemoglobin of 6 5 Gm. The white blood cells were 6,600, and the differential count showed polymorphonuclears 50 per cent and small lymphocytes 50 per cent There was marked anisocytosis and poikilocytosis. The color index was 1 5 Bone marrow smear revealed a marked hyperchromic macrocytic anemia. The urine showed a pH of 4.5, specific gravity of 1 018, albumin 1 plus. The blood urea nitrogen was 15 mg. per 100 cc., creatinine 1.3, and blood sugar 115 The sedimentation rate was 1 in fifteen minutes and 25 in one hour The Wassermann test was negative. The stools were negative for ova and parasites. The icteric index was 7 and the Van den Bergh reaction negative Cephalin flocculation test was negative, phosphorus 2.9, phosphatase 1.9 Armstrong-King units. Total

TABLE 1.—Results of Treatment of Patients with Neoantergan

Allergic Condition	Number of Cases	Relief	No Relief	Percentage Relieved
Hay fever	96	67	29	69 8
Vasomotor rhinitis	22	13	9	59 1
Bronchial asthma	15	2	13	13 3
Acute urticaria	1	1	0	100 0
Chronic urticaria	2	1	1	50 0
Allergic eczema	1	0	1	0 0
Pruritus	1	1	0	100 0
Angioneurotic edema	1	1	0	100 0
Vernal catarrh	1	0	1	0 0
Contact dermatitis	1	1	0	100 0
Totals	141	87	54	61 7

TABLE 2.—Side Reactions in 35 Cases (24.8 Per Cent) Treated with Neoantergan

Side Reaction	Number of Cases
Drowsiness	13
Nausea	11
Diarrhea	11
Abdominal cramps	8
Headache	4
Dizziness	3
Tachycardia	3
Weakness	2
Sweating	2
Pruritus	2
Tiredness	1

Vomiting	1
Palpitations	1
Nervousness	1

allergic diseases The dose was 50 mg, administered three times a day When relief was obtained, the patients were instructed to take the drug only when necessary to ameliorate any recurrence of symptoms

The symptomatic results and the toxic reactions were tabulated The types of side reactions were also noted Each of the patients reported as having side reactions had one or more Those that were classified as obtaining relief had to show a satisfactory amount to be so considered In some patients Neoantergan had to be discontinued owing to the severity of undesirable reactions Where toxic reactions were not too severe, the patient was able to continue the drug at a reduced dosage and frequency In many cases the toxic reactions would disappear with continued use of the medication The relief obtained was only temporary and seldom complete One third of the patients experienced alleviation intermittently, that is, they would be relieved at one period of time and not at another Some individuals were benefited when they began to use the drug, but later on it failed to take effect The other two thirds showed improvement quite consistently The results are shown in Tables 1 and 2

Summary and Conclusions

Neoantergan was given to a series of 141 patients having various allergic disorders There was over-all relief in 61 7 per cent of the cases The best results were obtained in hay fever and vasomotor rhinitis Bronchial asthma gave the poorest results Toxic reactions occurred in 35 of the 141 cases, a percentage of 24 8 The drug was palliative in all cases The antihistaminic drugs are supposed to act by competing with the liberated histamine in their attachment to the receptor cells in the same way that the sulfonamides are supposed to compete with para aminobenzoic acid Therefore, only symptomatic relief, which lasts but a few hours, is obtained from each dose of the drug The determination of the offending allergen and its elimination or desensitization is still indicated The antihistaminic drugs can only be considered as a valuable adjuvant

PROGRESS NOTE

The midwinter meeting of the Council of the Massachusetts Medical Society, held on February 2, would have been of particular significance because of one fact alone That was the unanimous approval of the action of the Executive Committee in authorizing the Secretary to proceed, as an agent of the American Medical Association, in collecting the assessment that the Association has levied on its members

Of further significance was the Secretary's report that within two weeks of the mailing of the notice more than 1,500 checks have been received from over a quarter of the society's fellowship, some of the contributions being for sums in excess of that called for Remarkably few direct refusals to contribute have been received, some of the fellows of the society have expressed their desire to withold their contributions until assurance can be given that the American Medical Association will use the fund wisely and constructively

SINOAURICULAR BIGEMINY

MILTON SCHLACHMAN, M D , Corona, New York

(From the Department of Medicine, New York Medical College, Metropolitan Hospital Service)

UP TO the present the medical literature contains but few references to extrasystoles originating in the sinoauricular node, and none of the more popular and standard textbooks on electrocardiography discuss or illustrate this arrhythmia [1-6] This would seem to indicate that premature systoles of sinoauricular origin are extremely rare or that the arrhythmia has been overlooked because it simulates other arrhythmias so closely as to be wrongly diagnosed That this disturbance is not too common may be explained by the fact that the farther away the extrasystolic center is from the chief centers in the heart, the more common are the extrasystoles Thus, ventricular extrasystoles originating in the deeper specific tissue are most common, and those coming above the bifurcation of the common bundle are rarer, as are those originating in the auricular-ventricular node

This arrhythmia must be differentiated from a sinus arrhythmia, a 3 2 heart block, premature auricular systoles originating near the sinoauricular node, and a sinoauricular block. An important diagnostic point which was originally expressed by Lewis and Wenckebach and emphasized in subsequent reports is that the returning cycle following the extrasystole should be no longer and may be shorter than the normal cycle [4,6]

The resemblance of this condition to a respiratory arrhythmia is so great that one may suspect that many cases of sinoauricular extrasystoles have been misinterpreted as a respiratory arrhythmia As the premature beat originates in the sinoauricular node, the configuration of the P waves is exactly that of the normal sinus beat However, Scherf has pointed out that deformation of a normal sinus P wave may occur as a result of a change in the intra-auricular conduction, and Langendorf and Mintz report a case of sinoauricular premature beats in which the P waves are slightly different from the normal sinus P waves [3]

The following case is being reported because of the rarity of the condition and because a probable causative factor is indicated

Case Report

The patient was a fifty-six-year-old Puerto Rican cook who had been in this country for twenty-four years He was admitted to the hospital on March 1, 1947, with the chief complaints of loss of the sense of smell for the past year, dyspnea on stair climbing in the past six months, difficulty in swallowing of three months duration, weakness in the legs of three weeks duration, and a loss of 10 pounds in the past three weeks

History

The present illness dated back three years when, every morning on awakening, he experienced sharp epigastric pain which was relieved by eating The bowel habits had been regular until three weeks previously when a diarrhea of three to four stools daily occurred This diarrhea was not characteristic and contained no evidence of upper or lower gastrointestinal bleeding One year ago there was a sudden anoxia. For the past three months, food had seemed to stick in his throat and move down slowly However, there was no dysphagia, nausea, or vomiting A poor appetite had been present for the past month and was associated with a great weakness and loss of 10 pounds Shortness of breath on climbing two flights of stairs had been noted in the past six months There was no history of paresthesia or anesthesia The past history revealed syphilis in 1922 for which he was treated in Puerto Rico

Physical Examination

Examination revealed a poorly nourished male who appeared chronically ill The pupils reacted sluggishly to light and accommodation, the conjunctivae were pale and the sclera slightly jaundiced

The tongue was smooth and reddened No lymphadenopathy was noted The lungs were normal The heart was normal except for an arrhythmia which gave the impression of a bigeminy The blood pressure was 115/65 The abdomen revealed no palpable organs or masses The reflexes were normal, and vibratory sense was intact

Laboratory Examination

The following data were revealed The red blood cells numbered 1,630,000 on admission with a hemoglobin of 6 5 Gm. The white blood cells were 6,600, and the differential count showed polymorphonuclears 50 per cent and small lymphocytes 50 per cent There was marked anisocytosis and poikilocytosis The color index was 1 5 Bone marrow smear revealed a marked hyperchromic macrocytic anemia. The urine showed a pH of 4 5, specific gravity of 1 018, albumin 1 plus The blood urea nitrogen was 15 mg per 100 cc , creatinine 1 3, and blood sugar 115 The sedimentation rate was 1 in fifteen minutes and 25 in one hour The Wassermann test was negative The stools were negative for ova and parasites The icteric index was 7 and the Van den Bergh reaction negative Cephalin flocculation test was negative, phosphorus 2 9, phosphatase 1 9 Armstrong-King units. Total

FIG 1 Electrocardiogram (lead II) taken on March 3 showing bigeminal rhythm

cholesterol was 196, cholesterol esters 94, total serum proteins 6 7, albumin 4.5, globulin 2 2, and the albumin-globulin ratio 2 The blood sodium was 329 mg per cent, potassium 16, and chlorides 598 The gastrointestinal series was negative An otolaryngologic consultation revealed an atrophic rhinitis The final diagnosis was pernicious anemia

Electrocardiography

Figure 1 shows a bigeminal rhythm which at first glance would seem to be a respiratory arrhythmia However, with a cardiac rate of 80 per minute, the patient would have to have a rhythmic respiratory rate of 40 per minute—actually his rate was 18 per minute—in order to produce such a regular respiratory arrhythmia. The P-R interval of the normal sinus beat is 0 12 and that of the premature sinus beat is exactly the same The P-P interval between the preceding normal P wave and the premature P wave is 0 68 second, while the P-P interval between the premature P wave and the following normal P wave is 0 96 second

As the returning cycle after the extrasystole is longer than the preceding cycle, this would seem to cast doubt on the impression that these premature beats are of sinus origin However, as there are no two succeeding normal beats, the returning cycle is not necessarily longer than a normal cycle would be As each normal beat is followed by a premature one, alternating length cycles are bound to occur A premature auricular beat originating near the sinus node would conceivably give a similar picture, but here one would expect the P waves not to simulate the sinus P wave exactly

A sinoauricular block can be dismissed by the fact that the P-P interval between the premature P wave and the subsequent P wave should be twice the length (1 36 seconds) of the P-P interval which immediately precedes the premature beat Where a sinoauricular block is less than twice the length of two normal beats, it will not be as short as 0 96 second Usually, in a sinoauricular block the P-R interval after the blocked beat is shorter than the normal conduction, and no varying P-R interval is present here

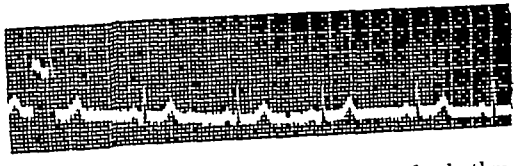

FIG 2 Deep inspiration—bigeminal rhythm has been replaced by a sinus arrhythmia of the nonphasic type

FIG 3 Deep expiration—re-establishme bigeminal rhythm.

A 2 1 block is not present as every I followed by a QRS complex

Figures 2 and 3 represent lead II taker breath held in deep inspiration and deep e respectively In Fig 2 the P-P intervals 0 96, 0 92, 0 84, 0 92, and 0 76 second geminal rhythm has been eliminated and re a sinus arrhythmia of the nonphasic type known that deep respiration will cause a vagal tone which may give rise to an a stimulus formation within the sinoauricu Evidently, the vagal stimulation was stro to eliminate the sinoauricular extrasystol

Figure 3 which was taken in deep expirat a re-establishment of the bigeminal rhyt P-P intervals alternate regularly and c between 0 72 and 0 96 second, which re-e the bigeminal rhythm at a rate slightly from that seen in Fig 1 Nevertheless, arrhythmia is present

The presence of the bigeminy when the held in deep expiration definitely elimi possibility that this arrhythmia is due to in vagal tone induced by respiration Sur arrhythmia were dependent on respiration, have disappeared when the breath was h this obviously did not occur

FIG 4 Recorded during the application c sinus pressure

Figure 4 was recorded during the appli carotid sinus pressure The P-P interval the preceding normal P wave and the pren wave remains constant at 0 68 of a second ever, the P-P interval between the pren wave and the subsequent normal P wave slight variation between 0 92 and 1 0 second 5 taken after carotid sinus pressure had ceas cycles of 0 96 second alternating regularly intervals of 0 68 second

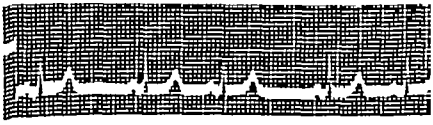

FIG 5 Record taken after carotid sinus had ceased

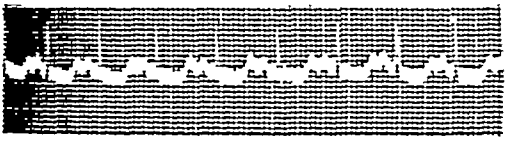

FIG. 6 Electrocardiogram taken during the inhalation of amyl nitrite showing disappearance of arrhythmia and replacement by tachycardia

The carotid sinus pressure exerted enough influence on the regular sinus impulse formation to cause a slight nonphasic sinus arrhythmia but did not influence the formation of the premature beats which always came at a regular interval after the normal beat A fixed coupling exists between the normal and the premature beat

Figure 6 was taken during the inhalation of amyl nitrite The arrhythmia has disappeared and is replaced by a tachycardia of 130 beats per minute The P-R interval is 0 12 second, which is the same as that before the inhalation of amyl nitrite, and there is a regular P-P interval of 0 42 second.

As often happens with amyl nitrite, extrasystoles are dissipated This is probably due to a shortening of diastole so that extrasystoles cannot appear However, an increased sympathetic tone as a result of the fall in blood pressure or a better nourishment of the sinoauricular node because of coronary artery dilatation may also play a role

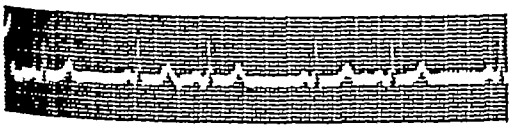

FIG 7 Electrocardiogram taken on March 21, 1947, showing persistence of bigeminy

Figure 7 was taken on March 21, 1947, at which time the red blood count was 1,580,000 and the hemoglobin 7 5 Gm The bigeminy still persisted three weeks after recording the first tracing The P-P intervals alternated regularly between 0 68 and 0.98 second.

Figure 8 was taken on April 25, 1947 at which time the red cells were 3,820,000 and the hemoglobin 13 Gm. The bigeminal rhythm had disappeared and had been replaced by a sinus arrhythmia which is proved by the irregular P-P intervals of 0 76, 0 76, 0 76, and 0 68 second. Thus, with an improvement

FIG 8 Electrocardiogram taken on April 25, 1947 Bigeminal rhythm has disappeared and been replaced by a sinus arrhythmia

of the blood picture, the bigeminal rhythm has disappeared

Discussion

It is realized that the criticism may be offered that the postextrasystolic period is longer than the pre-extrasystolic period, and, therefore, in reality a compensatory period exists after the premature beat which makes it of doubtful sinoauricular origin, for the returning cycle should be only as long as that of a normal beat

Unfortunately, no recording of two successive normal beats were obtainable in the tracings so that it is difficult to state just how long a normal cycle may be The identical contour of the P waves in the tracings in both the normal sinus beats and the premature sinus beats makes the diagnosis of premature auricular systoles arising near the sinoauricular unlikely One would expect some deformation of the P waves and a variation in the transmission of the impulse if the latter were so Langendorf and Mintz in their second case state that the diagnosis between sinoauricular extrasystoles and premature auricular contractions may be difficult but also base their diagnosis on the similarity of the premature P waves and the normal sinus P waves [3] In addition, they are not able to compare the postextrasystolic period with the normal sinus P-P intervals, for, as in the case described here, their tracing does not show successive normal sinus beats

The case reported by Geiger and Goener shows tracings which are similar to our own [2] Fortunately, in their report there are two normal sinus beats in succession which show that the normal P-P intervals are similar to the intervals between the premature P waves and the following P waves A comparison of their tracings and those reported here show an identical picture

Langendorf and Mintz in their first case of sinoauricular extrasystolic bigeminy also show tracings similar to those pictured here [3] Lead I in their report shows a normal sinus rhythm, and they are able, therefore, to measure the normal P-P intervals and compare them to the premature P wave and subsequent P wave intervals Nevertheless, the cycle following the premature beat is longer than the preceding cycle which is not unlike the tracings in this case report

A sinoauricular block occurring in a patient who had not received digitalis is indeed a great rarity Moreover, one would not expect a sinoauricular block to remain stable for a period of three to four weeks A sinoauricular block, with a constant blocking of every third impulse to give rise to a 3 2 block, of this duration has never been reported to my knowledge

It seems probable that the sinoauricular extra-

FIG 1 Electrocardiogram (lead II) taken on March 3 showing bigeminal rhythm

cholesterol was 196, cholesterol esters 94, total serum proteins 6 7, albumin 4.5, globulin 2 2, and the albumin-globulin ratio 2 The blood sodium was 329 mg per cent, potassium 16, and chlorides 598 The gastrointestinal series was negative An otolaryngologic consultation revealed an atrophic rhinitis The final diagnosis was pernicious anemia

Electrocardiography

Figure 1 shows a bigeminal rhythm which at first glance would seem to be a respiratory arrhythmia However, with a cardiac rate of 80 per minute, the patient would have to have a rhythmic respiratory rate of 40 per minute—actually his rate was 18 per minute—in order to produce such a regular respiratory arrhythmia. The P-R interval of the normal sinus beat is 0 12 and that of the premature sinus beat is exactly the same The P-P interval between the preceding normal P wave and the premature P wave is 0 68 second, while the P-P interval between the premature P wave and the following normal P wave is 0 96 second

As the returning cycle after the extrasystole is longer than the preceding cycle, this would seem to cast doubt on the impression that these premature beats are of sinus origin. However, as there are no two succeeding normal beats, the returning cycle is not necessarily longer than a normal cycle would be As each normal beat is followed by a premature one, alternating length cycles are bound to occur A premature auricular beat originating near the sinus node would conceivably give a similar picture, but here one would expect the P waves not to simulate the sinus P wave exactly

A sinoauricular block can be dismissed by the fact that the P-P interval between the premature P wave and the subsequent P wave should be twice the length (1 36 seconds) of the P-P interval which immediately precedes the premature beat Where a sinoauricular block is less than twice the length of two normal beats, it will not be as short as 0 96 second. Usually, in a sinoauricular block the P-R interval after the blocked beat is shorter than the normal conduction, and no varying P-R interval is present here

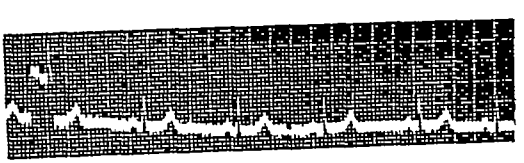

FIG 2 Deep inspiration—bigeminal rhythm has been replaced by a sinus arrhythmia of the nonphasic type

FIG 3 Deep expiration—re-establishment of the bigeminal rhythm.

A 2 1 block is not present as every P wave is followed by a QRS complex

Figures 2 and 3 represent lead II taken with the breath held in deep inspiration and deep expiration, respectively In Fig 2 the P-P intervals are 0 64, 0 96, 0 92, 0 84, 0 92, and 0 76 second The bigeminal rhythm has been eliminated and replaced by a sinus arrhythmia of the nonphasic type It is well known that deep respiration will cause a change in vagal tone which may give rise to an arrhythmic stimulus formation within the sinoauricular node Evidently, the vagal stimulation was strong enough to eliminate the sinoauricular extrasystoles

Figure 3 which was taken in deep expiration shows a re-establishment of the bigeminal rhythm. The P-P intervals alternate regularly and constantly between 0 72 and 0 96 second, which re-establishes the bigeminal rhythm at a rate slightly different from that seen in Fig 1 Nevertheless, a similar arrhythmia is present

The presence of the bigeminy when the breath is held in deep expiration definitely eliminates the possibility that this arrhythmia is due to variations in vagal tone induced by respiration Surely, if the arrhythmia were dependent on respiration, it should have disappeared when the breath was held, and this obviously did not occur

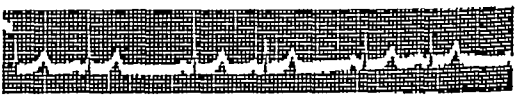

FIG 4 Recorded during the application of carotid sinus pressure

Figure 4 was recorded during the application of carotid sinus pressure The P-P interval between the preceding normal P wave and the premature P wave remains constant at 0 68 of a second However, the P-P interval between the premature P wave and the subsequent normal P wave shows a slight variation between 0 92 and 1 0 second Figure 5 taken after carotid sinus pressure had ceased shows cycles of 0 96 second alternating regularly with P-P intervals of 0 68 second

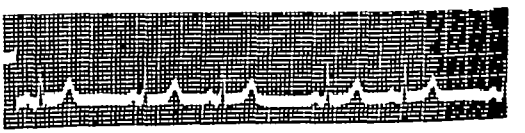

FIG 5 Record taken after carotid sinus pressure had ceased

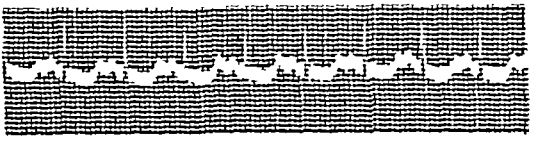

FIG 6 Electrocardiogram taken during the inhalation of amyl nitrite showing disappearance of arrhythmia and replacement by tachycardia.

The carotid sinus pressure exerted enough influence on the regular sinus impulse formation to cause a slight nonphasic sinus arrhythmia but did not influence the formation of the premature beats which always came at a regular interval after the normal beat A fixed coupling exists between the normal and the premature beat

Figure 6 was taken during the inhalation of amyl nitrite The arrhythmia has disappeared and is replaced by a tachycardia of 130 beats per minute The P-R interval is 0 12 second, which is the same as that before the inhalation of amyl nitrite, and there is a regular P-P interval of 0 42 second.

As often happens with amyl nitrite, extrasystoles are dissipated. This is probably due to a shortening of diastole so that extrasystoles cannot appear However, an increased sympathetic tone as a result of the fall in blood pressure or a better nourishment of the sinoauricular node because of coronary artery dilatation may also play a role

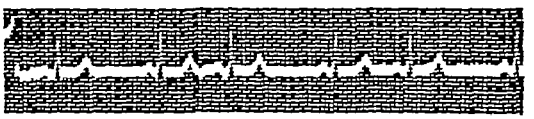

FIG 7 Electrocardiogram taken on March 21, 1947, showing persistence of bigeminy

Figure 7 was taken on March 21, 1947, at which time the red blood count was 1,580,000 and the hemoglobin 7 5 Gm The bigeminy still persisted three weeks after recording the first tracing The P-P intervals alternated regularly between 0 68 and 0 98 second.

Figure 8 was taken on April 25, 1947 at which time the red cells were 3,820,000 and the hemoglobin 13 Gm The bigeminal rhythm had disappeared and had been replaced by a sinus arrhythmia which is proved by the irregular P-P intervals of 0 76, 0 76, 0 76, and 0 68 second. Thus, with an improvement of the blood picture, the bigeminal rhythm has disappeared

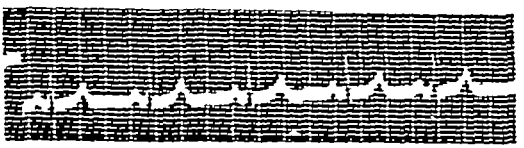

FIG 8. Electrocardiogram taken on April 25, 1947 Bigeminal rhythm has disappeared and been replaced by a sinus arrhythmia.

Discussion

It is realized that the criticism may be offered that the postextrasystolic period is longer than the pre-extrasystolic period, and, therefore, in reality a compensatory period exists after the premature beat which makes it of doubtful sinoauricular origin, for the returning cycle should be only as long as that of a normal beat

Unfortunately, no recording of two successive normal beats were obtainable in the tracings so that it is difficult to state just how long a normal cycle may be The identical contour of the P waves in the tracings in both the normal sinus beats and the premature sinus beats makes the diagnosis of premature auricular systoles arising near the sinoauricular unlikely One would expect some deformation of the P waves and a variation in the transmission of the impulse if the latter were so Langendorf and Mintz in their second case state that the diagnosis between sinoauricular extrasystoles and premature auricular contractions may be difficult but also base their diagnosis on the similarity of the premature P waves and the normal sinus P waves [3] In addition, they are not able to compare the postextrasystolic period with the normal sinus P-P intervals, for, as in the case described here, their tracing does not show successive normal sinus beats

The case reported by Geiger and Goener shows tracings which are similar to our own.[2] Fortunately, in their report there are two normal sinus beats in succession which show that the normal P-P intervals are similar to the intervals between the premature P waves and the following P waves A comparison of their tracings and those reported here show an identical picture

Langendorf and Mintz in their first case of sinoauricular extrasystolic bigeminy also show tracings similar to those pictured here [3] Lead I in their report shows a normal sinus rhythm, and they are able, therefore, to measure the normal P-P intervals and compare them to the premature P wave and subsequent P wave intervals Nevertheless, the cycle following the premature beat is longer than the preceding cycle which is not unlike the tracings in this case report

A sinoauricular block occurring in a patient who had not received digitalis is indeed a great rarity Moreover, one would not expect a sinoauricular block to remain stable for a period of three to four weeks A sinoauricular block, with a constant blocking of every third impulse to give rise to a 3 2 block, of this duration has never been reported to my knowledge

It seems probable that the sinoauricular extra-

systolic bigeminy in this case was caused by the anemia Until the blood picture rose to approach that of normal, the sinoauricular extrasystoles persisted We realize that the critical experiment would have been to permit the treatment of the pernicious anemia to lapse and see whether re-establishment of the extrasystoles occurred with a relapse of the blood picture However, we did not feel that such a drastic procedure was justifiable

Summary

1 A case of sinoauricular bigeminy is presented and the reasons for arriving at this diagnosis given

2 A probable causative factor, i e , anemia, is proposed

CONGENITAL CONTRACTURE OF THE FIFTH FINGER

RICHARD MARTON, M D , and OTTO STEINBROCKER, M D , New York City

(From the Arthritis Clinic, Fourth Medical Division (New York University), Bellevue Hospital)

CONGENITAL contracture of the digits, notably of the fifth finger, so often, in the experience at our clinic, leads to the diagnosis of rheumatoid arthritis, other arthropathy, or Dupuytren's contracture, that we are presenting the four cases in this report to emphasize the importance of recognizing these anomalies A more serious diagnosis is especially likely to be made when myalgias or arthralgias are associated in other joints or if changes in the articular or soft tissues are present in the affected digits

A wide variety of digital anomalies has been reported These are discussed extensively by Gates who makes the statement, "Probably more abnormalities are known of the hands than of any other part of the body except the eye "[1] Those which have been sufficiently common or distinct to be described as specific entities are included in Table 1 [1-4]

Congenital contracture of the little finger is one of the most frequent of the inherited digital anomalies It was termed streblomicrodactyly (Gr *strables,* bent, *micro,* small, *dactylos,* finger) by Hefner [5] Although camptodactyly (Gr *kamptos,* bent, *dactylos,* finger) has sometimes been used synonymously, it really refers to flexion of any of the fingers The appropriate suggestion has been made that camptodactyly shall be used in this general fashion to denote hereditary bending of any finger, while streblomicrodactyly is reserved to designate only flexion in the little finger, a special form of camptodactyly [6]

This congenital anomaly has a definite familial incidence The mode of inheritance appears to be that of a simple Mendelian dominant trait [7 8] The condition is bilateral and symmetric It is characterized by a flexed position of the proximal interphalangeal joints of the fifth fingers and often of the fourth fingers [9] The defect is present at birth According to Magnusson, it tends to remain static until about the tenth year The flexion at that period usually progresses for a time and is then arrested, recommencing again for a year or two at the age of sixteen or eighteen After twenty years there is virtually no advancement of the deformity, and the flexion rarely exceeds 90 degrees The affected finger cannot be extended or abducted to any degree Hyper-

TABLE 1 —CONGENITAL ANOMALIES OF THE DIGITS

Polydactylism—supernumerary digits.
Macrodactylism—congenital hypertrophy of one or more digits.
Ectrodactyly—suppression of digits Fingers may be deficient in number length or both
Brachydactyly—abnormal shortness of the digits usually there are only two phalanges in such fingers
Apical dystrophy— a form of shortened fingers to a lesser extent in toes manifested by absence of the terminal portion of fingers 2 to 5 with nearly or quite complete absence of nails [1]
Split hand or foot— lobster claw
Symphalangism—fusion of the proximal and middle phalanges into one in the ring and little fingers
Congenital ankylosis of the index finger at any of the interphalangeal joints
Clinodactyly—fingers bent in the radial direction. Deviation may also be ulnar
Camptodactyly—congenital flexion of fingers
Streblomicrodactyly—congenital flexion of the fifth finger

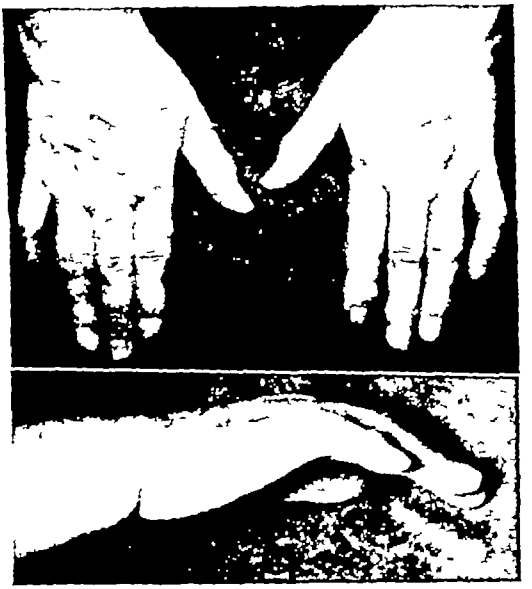

FIG 1 Congenital contracture of all fingers, more severe at each fifth digit, in a patient with Heberden's nodes Side view shows the natural flexion position of the fingers

extension at the metacarpophalangeal joint is associated The distal interphalangeal joint may also be affected There are no local cutaneous, articular, or periarticular changes apart from the flexion, unless some complication arises

The pathogenesis of the anomaly is not clear Hefner has attributed it to shortening of the flexor digitorum sublimis tendon of the little finger [8] Magnusson implicates faulty development of the articular surface of the proximal interphalangeal joint [9] The incidence of this condition is difficult to ascertain, but is high enough to be borne in mind Occasionally, it may be part of a generalized congenital flexion of the digits simulating a widespread polyarthropathy (Fig 1)

This anomaly may be confused with rheumatoid or other arthritis or with Dupuytren's contracture The history of digital flexion since childhood, the absence of progressive arthropathy or of destructive articular changes, and the lack of systemic signs of rheumatoid arthritis should exclude the latter disease In rare cases the rheumatoid process may develop in a patient with streblomicrodactyly Dupuytren's contracture is distinguished from this congenital contracture by its common unilateral distribution, especially in the early stage, frequent alterations of the palmar skin, its onset at an advanced age, and its progressive changes with flexion, usually most marked at the metacarpophalangeal articulations In our experience rheumatoid arthritis, and commonly osteoarthritis, is the disease with which streblomicrodactyly is most apt to be confused, especially when myalgia, arthralgia, peritendinitis, other tendon changes, or even coincidental degenerative changes in the digital joints, are present

The following patients gave a history of congenital anomaly, but a familial incidence could not be traced They are cited to illustrate the clinical simulation of arthropathy, especially rheumatoid

Case Reports

Case 1 —Mrs J H., a twenty-six year-old married nurse, complained of pain and stiffness of the fingers of one year's duration. There had been no swelling (Fig 2) Vasomotor disturbances were present at the digits During this time she had suffered from "nervous stomach" and many emotional tensions The patient had been treated with analgesics and physiotherapy She was referred for confirmation of the desirability of chrysotherapy for her unresponsive "rheumatoid arthritis" Physical examination was negative, excepting the congenital flexion of each fifth finger

Sedimentation rate was 2 mm per hour, blood uric acid 2 2 mg per cent, complete blood count normal, urinalysis negative, and blood Wassermann negative The congenital nature of the marked flexion of the fifth fingers and the slight flexion position of all of the digits was brought out finally by a detailed history-taking The harmless nature of the finger flexion was explained Its independence of the local aches and vasomotor symptoms were reassuring to the patient She was soon greatly relieved of the superimposed symptoms by moving to her own apartment instead of residing with her critical inlaws who were evidently the source of great emotional conflict.

Case 2 —A B , a female physician in the fifth decade, came to our attention because she feared she was developing rheumatoid arthritis She had felt pains in her hands and at various joints for five to six months At the beginning of this period she thought she had noticed increased flexion deformity of the fifth fingers associated with the multiple myalgias She worried about this and, after efforts at self-treatment, decided to get another opinion Examination and tests revealed no basis for the com-

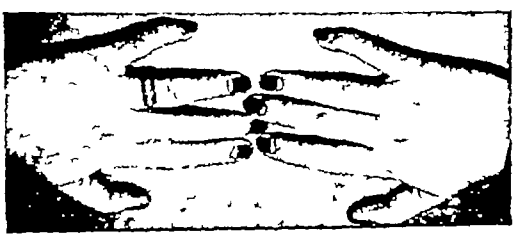

FIG 2 Congenital contracture of the fifth fingers.

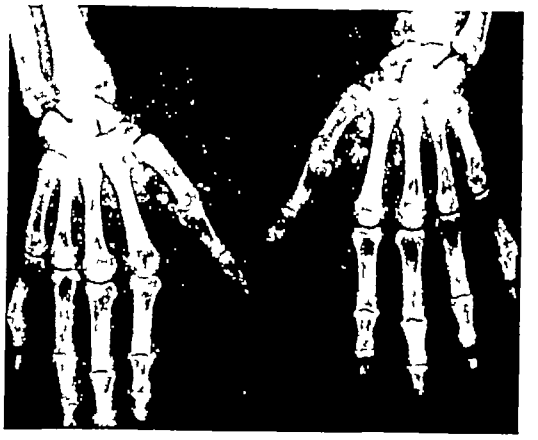

FIG 3 Roentgenographic appearance of congenitally contracted fifth fingers

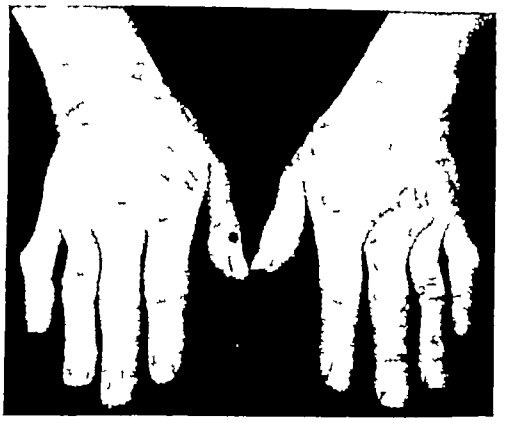

FIG 4 Congenital contracture of the fifth fingers with overlying cystic tendinitis at the proximal interphalangeal joints

plaints other than simple contracture of each fifth finger (Fig 3) On close questioning she recalled that contractures of her fifth fingers were present as far back as she could remember in childhood with slight if any actual increase in later years After reassurance that the changes in her fifth fingers were evidently congenital, she agreed that the history made this interpretation most logical Her other symptoms quickly subsided with this reassurance

Case 3 —Mrs P , a fifty-five-year-old housewife, was under treatment in our clinic for complaints associated with osteoarthritis involving also the digital joints As an incidental finding, streblomicrodactyly was noted, with overlying cystic tendinitis on the left (Fig 4) Here again the original flexion peculiarity was forgotten, and the seriousness of the arthropathy was exaggerated by concern over the flexion and its distorted appearance given by the tendon changes

Case 4 —Mrs N S , a fifty-eight-year-old housewife, suffered from pains in the hands associated with osteoarthritic changes of the joints with Heberden's nodes at the finger tips The clinical picture of arthritis was distorted by the congenital flexion contractures of all fingers, more severe at the fifth fingers (camptodactyly and streblomicrodactyly) The patient knew of the congenital nature of the defects and requested the examining physician not to be influenced by these changes in evaluating her condition and planning treatment, as had occurred in the past

The treatment of congenital contracture of the fifth finger has not been standardized When seen early, extension exercises, massage, and traction have been recommended For the later decades, various surgical procedures have been suggested In the experiences of one of us (O S) based on other cases not included here, it may be stated that this congenital deformity is usually an innocuous, asymptomatic anomaly, requiring no treatment Radical intervention is indicated on the rare occasions when the flexion contractures interfere with the patient's occupation. The condition is important chiefly for its recognition and differentiation from the more serious disorders it may suggest

Summary

1 The salient features of streblomicrodactyly as a hereditary congenital anomaly of the fifth finger have been presented

2 The tendency to confuse this entity with rheumatoid arthritis, other arthropathy, or with Dupuytren's contracture has been noted

3 The condition is important chiefly for its recognition as a benign, relatively nonprogressive, anatomic peculiarity

THERE IS STILL TIME TO PLAN TO ATTEND THE 143RD ANNUAL CONVENTION, MAY 2 TO 6, HOTEL STATLER, BUFFALO

THE EFFECT OF ANTIRETICULAR CYTOTOXIC SERUM ON PATIENTS WITH OSTEOARTHRITIS

Louis W Granirer, M D , Broad Channel, New York

(From the Arthritis Clinic, Department of Medicine, New York Post-Graduate Medical School and Hospital)

SERUMS commonly used in medicine to help cure infectious diseases are made from the blood of animals injected with increasing doses of the bacteria or toxins responsible for these diseases The resulting serums contain specific antibodies Similarly, antireticular cytotoxic serum is made from the blood of animals injected with increasing doses of suspensions of human tissue belonging to the reticuloendothelial system, such as the spleen and bone marrow The antibodies present are directed against the human reticuloendothelial tissue cells It was maintained by Bogomolets and his school that this specific cytotoxic serum, when administered in very small doses, does only negligible harm and stimulates the reticuloendothelial system to greater activity [1] When injected into man in large doses, this serum is capable of paralyzing the reticuloendothelial system. This is only another application of the Arndt-Schulz law which provides that weak stimuli increase physiologic activity and very strong stimuli inhibit or abolish activity [2]

It is well known that the reticuloendothelial system includes the macrophages of the loose connective tissue, the reticular cells of the lymphatic and bone marrow tissue, the star-shaped Kupffer cells of the liver, the flat "littoral" (adventitious) cells about the blood vessels, the "dust" cells of the lungs, and both the white and red pulp of the spleen.[3] Macrophage cells of the nerve tissue are called "microglia" cells [4] Wherever located, the macrophages in these widely scattered parts of the body may be set free to wander under the influence of appropriate stimuli. Thus, they take their part in inflammation and destruction of blood cells, and in the bone marrow and lymphatics they are concerned with the production of new red and white blood cells Bogomolets ascribed additional important functions to the reticuloendothelial system

1 A growth function including the regulation of cellular nutrition and metabolism and involving the processes of oxidation, repair, alteration of capillary permeability, and storage. This trophic function is important in its effect on normal or premature aging of the tissues.

2 A plastic function effecting the healing of wounds, ulcers, and fractures and the regeneration of tissues

3 A protective function—the well-known scavenging action of the macrocytes—not only against disease organisms but also against abnormal growths

4 An autoregulative function connected with the hormones Apparently, good health depends on the proper functioning of the reticuloendothelial system.

Method

The following study was planned to observe the effect of antireticular cytotoxic serum on patients with osteoarthritis picked at random in our clinic

The antireticular cytotoxic serum is prepared in the following manner Reticuloendothelial cells from man (spleen and bone marrow) are injected into rabbits until a titer of 1 100 has developed in the rabbits' blood The serum is withdrawn and separated by centrifugation and after standardization is dried from the frozen state and dispensed in vials.* It requires only dilution to ten times the original volume with physiologic saline solution to yield the serum ready for injection in humans The first injection, subcutaneously, is 0 5 cc. of the diluted serum, the second 1 0 cc , and the third injection 1 5 cc , each given at intervals of two or three days A series consists of a course of three injections Six weeks rest period was allowed between courses

Within the past year sixteen patients with osteoarthritis were treated with this serum Sensitivity to rabbit serum was ruled out by skin testing each patient Except for four patients, each case received one or two additional series of treatments, and all were observed for one year

Results

In the absence of any specific statistics, almost any form of treatment in chronic arthritis seems to produce about 20 per cent arrest, 30 per cent improvement, and 50 per cent of failure [5] In the follow-up study here, it was noted that the arthritis in over 80 per cent of the patients became as severe as it had been in the pretreatment period The toxic manifestations, urticaria, and fever in 50 per cent of the cases were quite marked. The final results here were not impressive, and the beneficial effects, if any, were short-lived The use of this serum in these cases with osteoarthritis was no more effective than the accepted treatment of rest, physical therapy,

* Generously supplied by Wyeth Inc. as Wyeth ACS.

orthopedic treatment, improved nutrition, psychosomatic medicine, climate, correcting metabolic disturbances, and rehabilitation

Summary

Sixteen patients with osteoarthritis, ages forty-nine to seventy-two with symptoms of from six months to twenty years duration, were treated with antireticular cytotoxic serum according to the schedule described Only two patients showed marked improvement at the end of the year Four patients had slight improvement, and the remaining ten had no benefit from the treatment Fifty per cent of the patients showed marked local reactions to the serum, followed by generalized urticaria, chills, and fever

SUGGESTION FOR A SIMPLIFIED OPHTHALMOSCOPE, OTOSCOPE, FLASHLIGHT DIAGNOSTIC INSTRUMENT

WILLIAM A GREENE, JR , M D , Rochester, New York

(From the Department of Medicine of the University of Rochester, School of Medicine and Dentistry, and the Medical Clinic of the Strong Memorial and Rochester Municipal Hospitals)

WHAT we have here to suggest is no new instrument but rather a simplification of one of the most frequently used electrically illuminated diagnostic instruments This simplification has developed as a result of the impracticability found by the author in the use of the ophthalmoscope and otoscope in the past few years, first while in an evacuation hospital in the Army and more recently while a house officer in a busy general hospital This simplified instrument has proved both convenient and efficacious *

The ophthalmoscope-otoscope instruments available and in use at present are all unnecessarily complex and cumbersome They cannot easily or gracefully be carried in the pocket The alternative is to leave the instrument in its case in some central location to be fetched when needed This practice results in two unfortunate occurrences We are apt to neglect certain parts of an examination, perhaps an important part, rather than take the time to get the ophthalmoscope or otoscope Second, when these instruments are left unattended they have a habit of disappearing in whole or in part

The May head and the ear speculum with a beam of light are the essential features of the ophthalmoscope and otoscope and are very effective tools for examining the inside of the eye and the ear However, the so-called operating

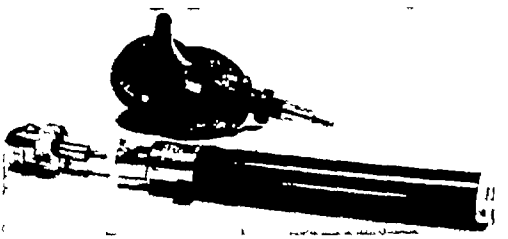

FIG 1 Entire instrument combination including battery handle, flashlight head, and ophthalmoscope head

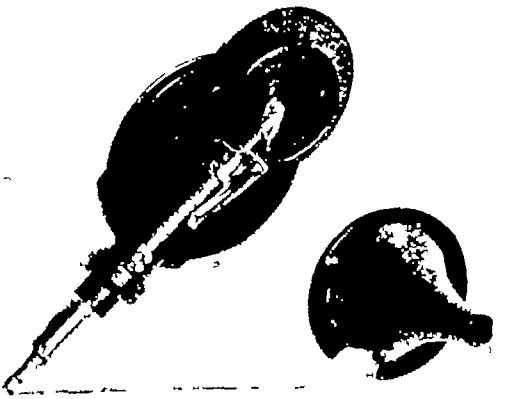

FIG 2 May ophthalmoscope head with otic speculum detached

* The instrument was manufactured for the author by Bausch and Lomb Optical Company Rochester New York

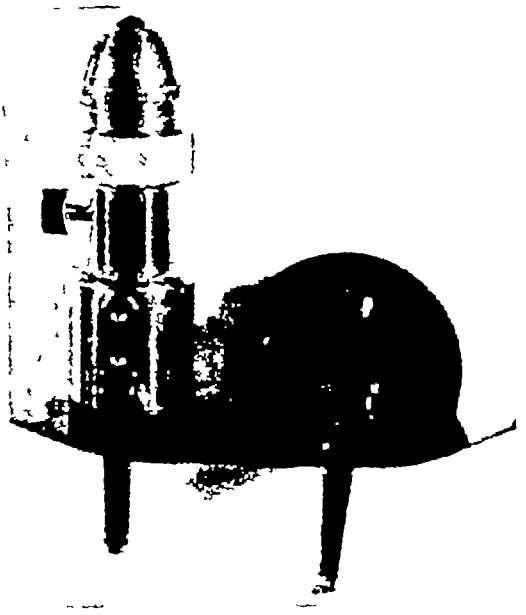

FIG 3 Method of carrying instrument in pocket, the battery handle and flashlight head as one unit and the ophthalmoscope-otoscope head as a separate unit

otoscope head is, in most cases, superfluous With the present extent of specialization most manipulation inside the ear is done by an otologist The great majority of physicians, and especially those in hospital training need an otoscope purely for diagnostic purposes We use these instruments more to be sure that there is no pathology present than to see whether there is If any pathology is found, the problem is, in most instances, referred to the proper specialist

With these facts in mind we have attached the otic speculum directly to the May ophthalmoscope head using the same optical system as a light source for illuminating the ear With this arrangement the ear canal and drum can be well visualized by looking through the +10, +12, +15, or +20 diopter lens One size speculum suffices for the great majority of examinations, the size depending on whether one deals with adults or children. Consequently, one detachable speculum fastened to the ophthalmoscope head, which is fitted with a metal clip, gives a compact instrument that can easily be carried in the pocket

Any size battery handle can be used with this ophthalmoscope-otoscope combination We have found most efficient to be the use of the pencil-size handle with a flashlight head attachment This flashlight also readily fits into the pocket For examination of the eye and ear the flashlight head is removed, and the ophthalmoscope-otoscope head is attached Together these instruments provide a readily available flashlight, otoscope, and ophthalmoscope The details are shown in the accompanying photographs (Figs 1,3)

NEW SYNTHETIC DRUG USED AGAINST PARKINSON'S DISEASE

Parpanit, a relatively new synthetic drug, is aiding victims of Parkinson's disease, also called the shaking palsy, according to Robert S Schwab, M D , and Denis Leigh, M.D , from the Department of Neurology and Psychiatry, Massachusetts General Hospital and Harvard Medical School, and the Brain Wave Laboratory, Massachusetts General Hospital, Boston, and based on a study of 50 patients Parpanit is one of the most efficient and least toxic of a number of related compounds developed in Switzerland The drug has desirable relaxing effects similar to derivatives of belladonna

Thirty-one of the group experienced more improvement from parpanit than they did from previous treatment with scopolamine, stramonium, or belladonna, other drugs used against the disease

The degree of improvement during parpanit therapy was usually about 25 per cent. Approximately half the 50 had a decrease in rigidity with increased freedom or speed of movement and greater ease in eating and talking, and about half noticed a decrease in tremor In 40 per cent of the group, symptoms had been present from one to five years, in 32 per cent from five to ten years, and in 28 per cent over ten years There was a fairly close connection between the duration of symptoms and severity of the disease

None of the 50 patients was bedridden Four additional bedridden patients with Parkinson's disease treated with parpanit were not significantly benefited. The disease developed following encephalitis in 38 cases and was associated with hardening of the arteries in seven cases.

No change from parpanit therapy was noticed in 11 patients, the effect of the drug being similar to that of previous treatment with scopolamine or stramonium. Eight were considered worse after parpanit therapy —*J.A.M.A , March 5, 1949*

BRONCHIECTASIS

LAURENCE MISCALL, M D , New York City

(From the Thoracic Surgical Service of Bellevue Hospital)

LESS than twenty years ago one of our standard medical texts disposed of the treatment of bronchiectasis in two lines by stating that it should be hygienic, dietetic, and symptomatic in character Since that time a voluminous literature dealing with all aspects of the subject abounds with proof that this forlorn outlook may be safely abandoned Surgeons interested in the problem believe that ample evidence also has been recorded to justify surgical approach as the procedure of choice in the attempt to cure these patients It is the intent of the writer to present some facts to support that contention

Several anatomic and clinical features of the disease bear significantly on this preference for surgery Bronchiectasis usually involves segmental adjoining bronchi in one or more lobes of the lung leaving other areas entirely normal It is not a uniformly progressive disease but may remain localized for years Extension has been regularly observed as the aftermath of the commonly repeated attacks of suppurative pneumonitis Bronchiectasis is almost always associated with parenchymal changes described as atelectasis or organizing pneumonitis which, in the long run, terminate as fibrosis and emphysema Moreover this disease quite often originates in youth with onset, estimated by some, at 40 per cent in the first decade and up to 70 per cent during the second decade

Although various theories have been advanced to explain all the features of this disease, many aspects still remain controversial Some permit repetition The role of true congenital defects is clearly illustrated by the association of situs inversus and bronchiectasis Perhaps this factor has been overstressed with insufficient attention being directed to the possibility of very early onset of acquired bronchiectasis in infancy and childhood Auspack and others have noted in infancy and childhood the presence of basal triangular shadows containing dilated bronchi which they have attributed to atelectasis [1] Some of these changes have reversed after bronchoscopy or other forms of bronchial drainage and have been labeled pseudobronchiectasis by Singer and Graham [2] Bronchial obstruction in some cases is a contributory factor It has not been constantly observed in many cases of proved bronchiectasis and, as in asthma, is not regularly accompanied by bronchiectasis However, such obstruction, accompanied by infection leading to atelectasis and parenchymal suppuration, favors its development or extension This point is of great importance and indicates the necessity of control of these factors by all necessary methods if the incidence of the disease is to be decreased by attack at the origin in early life The frequent occurrence of localized bronchiectasis after suppurative pneumonitis and lung abscess in later life lends support to the theory of parenchymal suppuration as the common origin of the disease The evidence linking definite organisms with this disease has not been conclusive

In summary, the pathologic material from autopsy and operative specimens indicates that bronchiectasis is a disease which often has its onset in early life and predominantly before the age of twenty It is a disease in which parenchymal and bronchial damage are regularly observed and have a reciprocal relation to each other both as cause and effect Pulmonary fibrosis and emphysema are the terminal results of repeated infection and progression and with the coexisting suppuration constitute the threat to health and life That this is a threat is illustrated by the fact that symptomatic bronchiectasis, unassociated with other disease, was demonstrated as the primary cause of death in 400 (2 2 per cent) of 18,100 consecutive autopsies for all causes of death in a recent survey at Bellevue Hospital Death occurred in 24 per cent of these cases before the age of fifty, all without benefit of definitive surgery These pathologic observations find parallels in the well-known clinical characteristics, some of which may have been regarded too lightly

The analysis of 146 cases of clinical bronchiectasis, admitted to the thoracic service of Bellevue Hospital over a three-year period yields material for thought While only 10 per cent of these cases were less than twenty years of age, 62 per cent were less than fifty Those in whom duration could be accurately determined had had symptoms for an average of at least eleven years They had been treated for these symptoms for from three to fifteen years During this time, as much as four years with repeated admissions had been spent as inpatients of various institutions Thirty patients had consumed one hundred five years of hospitalization Almost constant cough with copious, foul sputum had physically wrecked many of these unfortunates who often become social outcasts Recurrent

Presented at a meeting of the Medical Society of the County of New York April 26 1948

pneumonia, hemoptysis, abscess formation, and empyema had cost much, not only in human suffering but also in monetary loss

Of the 146 patients only 44 were operated, in spite of the fact that the chief complaint and reason for admission was serious hemoptysis in 60 patients, recurrent pneumonia in 30 patients, unremitting, copious, foul sputum in 51, and empyema, lung abscess, and asthma in five Fifty patients over fifty and 22 between forty and fifty were denied surgery Since these ages do not constitute a general valid contraindication to surgery, the cited reasons for such a course gains significance The decided prominence of inadequate functional reserve, too extensive lesions, and poor general condition suggest that lack of early curative therapy had contributed to progressive deterioration in health It is likely that they represent the inroads of longstanding and inadequately treated disease This is the natural course and clearly reflected by both pathologic and clinical knowledge These few figures agree with and complement the opinion of innumerable other observers They warrant the statement that bronchiectasis is a chronic progressive disease which requires active treatment to prevent progression to chronic invalidism and fatality and that this treatment should be prompt once the diagnosis is established To the pediatrician may be delegated the preventive side of this effort in recommending the use of all measures to reduce pulmonary infection All other cases of established bronchiectasis should immediately fall to the care of the surgeon for decision as to the time and extent of operation unless contraindicated by acceptable criteria Such a program will prevent the steady march of the disease and obviate the necessity of heroic surgery in the terminal phase

It appears then that once a patient has come for treatment for the usually serious symptoms of established bronchiectasis the situation calls for therapy planned to culminate in surgical excision of the diseased area Early treatment must be so directed, since, in this disease especially, the success of subsequent surgery is very directly related to the efficiency of such preparation It generally requires the meticulous and persistent use of all measures to correct the ravages of long chronic illness Bed rest, adequate diet reinforced with proteins, vitamins, and minerals, and the free use of blood are indicated for the almost constant weight loss, protein and specific deficiencies, and anemia Concurrent sinusitis and oral sepsis as contributing factors merit prompt remedy Regular chemotherapy has yielded excellent aid, and the agents used may be advantageously based on a close study of the bacterial flora present

The local pulmonary condition needs attention in minute detail Bronchial drainage by postural, aspirational, or bronchoscopic measures must be rigidly practiced within the patient's tolerance The use of oxygen and mucosal shrinking agents in conjunction with properly prepared chemotherapeutic aerosols increases and accelerates the effectiveness of bronchial toilet A favorable response may be expected from the persevering use of these methods, and its degree may be readily estimated by the general clinical improvement in the acute and chronic expressions of disease and a decrease in the amount and change in character of the sputum It is well known that bronchiectasis typically exhibits remissions and exacerbations The physician responsible for this early care should not be lulled into inactivity and procrastination by the apparent improvement which may follow this treatment The remission should not be lost by the cessation of therapy Therapy should be maintained to provide an opportunity for further and better evaluation of the status of operability and the period during which the patient can face surgery in optimum condition with minimal risk

Bronchoscopy should be routine, for it may lend both diagnostic and therapeutic aid The origin of secretions and hemorrhage may be localized When the latter has been severe, this information is indispensable and perhaps life-saving Transient bronchial obstruction due to tenacious or dried exudate, ulcerative and granulating lesions, and foreign bodies, sometimes unsuspected, may be relieved with great benefit The observation of true stenosis or tumors may alter the entire plan of operation

Accurate outlining of the diseased area should be based on the previous clinical findings At Bellevue, Amberson has for years emphasized the persistence of rales as a guide to the area to be bronchogrammed With careful previous examination of the chest it often is not necessary to visualize the entire tree The association of lingular and middle lobe disease with lower lobe disease is so frequent that, in the presence of the latter, the former areas should be regularly visualized Where doubt exists, it is better to visualize any questionable area The importance of care in this work cannot be overstressed, since it controls the aim of surgery The surgeon must have correct information if he hopes to accomplish his twofold purpose of total ablation of the diseased area and the maximal preservation of functionally competent respiratory tissue Since the retention of contrast medium for four to six weeks in the lung is not unusual and may lead to postoperative atelectasis, pneumonitis, and other complications, delay

for perhaps four to six weeks after instillation is desirable An added safety factor is to operate during the warmer months of the year when acute upper respiratory infections are at a minimum During this interim it is advisable to keep the patient under close observation to maintain the remission, and one may also cultivate the use of thoracic exercises which proved so helpful during the war

Since operability is directly governed by the status of cardiorespiratory functional reserve, it must be evaluated closely The younger age groups usually have sufficient reserve to permit the very extensive resections reported by Blades and Graham [3] In the borderline type of the older age groups, technical measure of the reserve may be the only feasible basis for planning operation because of the extensive and profound pulmonary changes The brilliant work of Cournand and his associates has been of inestimable value in correlating the selection of cases and the extent of operation [4] This contribution well merits the praise it has received When lack of facilities precludes such tests, clinical evaluation must be extremely careful Although fairly reliable, its accuracy does not approach that of the more exact methods

Surgical intervention should follow promptly the decision that a case is operable The reasons are many and clear Less pulmonary tissue is sacrificed with minimal extent of the disease Operation is simplified if recurrent episodes have not obliterated or frozen the pleural space and fissures The remaining undamaged lung expands more readily to fill the thorax which decreases the incidence of fistula and empyema The most favorable time for operation coincides with the reduction or disappearance of sputum which can be expected to minimize postoperative atelectasis, pneumonia, and lung abscess A persistently high sputum output should arouse suspicion of unrecognized bronchial obstruction or underlying abscess In some of these, preliminary drainage and secondary excision has offered greater safety than primary excision Operation is often demanded by severe hemorrhage Certain excision of the offending area in extensive disease can be based upon bronchoscopic localization, but in less extensive disease thorough extirpation suffices

In recommending this method of treatment, one can support it with the record which should be reviewed with the same attitude that the armed forces had toward its wounded The combat groups called upon the medical department not only to save life but to return a maximum number to fighting duty Short dual purpose, nothing was accomplished combat forces Surgeons believe the shows that the judicious use of surgery similar prospect to more bronchiectatic p than any other method and that the road cures is marked by an earlier and more utilization of it A bright outlook has f the perfection of intrahilar dissection the progress in anesthesia, the free use of the correct selection and preparation of and newer concepts and knowledge of respiratory function and chemotherapy

Patients may be assured of the safety o tomy and/or segmental resection Th tality rates have gradually fallen to les 2 per cent in several recent series of cases lobectomy has carried a small complicatio particularly empyema and bronchopleu tulas, which is somewhat less than that mental resection They have not been enough to curb the use of these proc Pneumonectomy can be reserved for very sive unilateral disease and should often b bined with methods to prevent mediastin and compensatory emphysema of the rem lung The mortality rate, which has gr fallen, may be expected to be less than 5 p in well-selected series

When the procedure is correctly gau remove the diseased and poorly functionin without unnecessary sacrifice of lung, a ce of symptoms and recurrences and an im ment in respiratory efficiency has follow can be regularly forecast The extent gevity in some very extensive cases remain proved

A cursory reading of the literature forces to agree with Riggins who in 1941 stated morbidity and mortality of untreated medically treated bronchiectasis is such th physician who routinely advises young with operable bronchiectasis against surg assuming a large responsibility and in all ability renders his patient a great disser It is the surgeon's contention that this applies also to a large section of patients older age group

Case Reports

AN UNUSUAL CASE OF ACQUIRED DEXTROCARDIA

GEORGE C LEINER, M D , and EMANUEL GOLDBERGER, M D , New York City

(From the Medical Division and Division of Pulmonary Diseases, Montefiore Hospital for Chronic Diseases)

FOLLOWING thoracoplasties, changes in the position of the heart and rotation of its axis may occur, the heart may be pulled into or pushed away from the collapsed side, cor pulmonale may occur, and electrocardiographic changes may or may not occur [1-3]

We wish to present a patient who, following thoracoplasty, developed unusual roentengologic and electrocardiographic findings

Case Report

The patient, J P , was a forty-year-old woman The onset of her disease was in 1931 with loss of weight, fatigue, and cough Pulmonary tuberculosis was diagnosed in 1932 with the sputum containing tubercle bacilli Right pneumothorax was induced in 1936, a pneumonolysis was done in 1937, which was followed by sputum conversion Because of obliterative pleurisy the pneumothorax was discontinued in 1938 The sputum turned positive again In 1939, bronchography and bronchoscopy showed occlusion of the right upper lobe bronchus Between March and June, 1943, a three-stage, nine-rib thoracoplasty and revision operation were performed on the right side The sputum was negative for some time but turned positive again Following the operations, cardiac pulsations were visible in the third, fourth, and fifth intercostal spaces, just to the right of the sternum No thrills or murmurs were noted

Roentgenologic examination showed a complete thoracoplasty on the right (Figs 1 and 2) No aerated lung could be seen on the right Heart and mediastinum were shifted to the right and seemed to be adjacent to the right lateral chest wall Because of this unusual radiologic appearance electrocardiographic studies were done

Five electrocardiograms were taken on the patient over a period of three years All the tracings were similar to those shown in Fig 3, which was taken several months before she died In Fig 3, the downward T waves in the three standard leads and precordial lead CF_4 are abnormal In other tracings T was also downward in precordial lead CF_2 In a previous paper, one of us (E G) pointed out that the downward T waves in the standard leads of this patient could be explained by the unusual position of the heart [4] However, changes in the position of the heart cannot explain the downward T waves in the precordial leads

The standard leads also show tall, thin P waves in leads II and III This pattern has been reported in cases of chronic cor pulmonale.[5] At autopsy the auricles were found to be normal, however

The patient developed a spread to the left lung and died in December, 1945, with the signs of respiratory insufficiency

The essential findings on autopsy were as follows The right pleural cavity is completely obliterated by fibrous scar tissue, no right lung is seen The heart is dislocated to the right and reaches the right thoracic wall to which it is attached by thin, easily torn adhesions The right lung is completely collapsed and located behind the heart in the apex of the thoracic cage to which it is firmly bound The left lung is markedly emphysematous and fills the entire left thoracic cage, it even extends somewhat over the midline to the right side

The right lung is markedly shrunken and fibrotic, about one third of the normal size The pleura is markedly thickened and covered with large sheets of parietal pleura and many fibrous tags The fissures are obliterated The lung is noncrepitant throughout The cut surface reveals dark, grayish, completely atelectatic parenchyma The posterior

FIG 1 Posteroanterior roentgenogram of the chest taken on July 14, 1945

FIG 2 Bucky film of chest taken on July 14, 1945

portion of the left lower lobe is the site of an extensive tuberculous pneumonia, and a similar smaller focus of tuberculous pneumonia is present in the anterior midportion of the lower lobe

The heart weighs 230 Gm The left ventricular wall measures 10 to 13 mm , the right ventricular wall 3 mm There is neither dilatation nor hypertrophy of the chambers The coronary arteries are normal in origin There is, however, a considerable preponderance of the right coronary artery which is a much wider vessel than the left and supplies most of the posterior wall of the heart In addition it shows a moderate number of small, circumscribed atheromatous patches, whereas the left circumflex is a fairly small, thin-walled vessel with a smooth intima

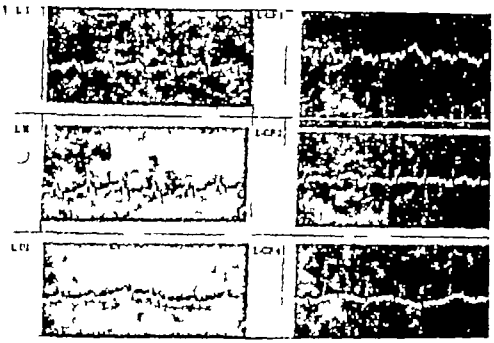

FIG 3 Electrocardiogram taken several months before the patient died

Summary

We have described the case report of a patient who had a complete thoracoplasty on the right side The roentgenologic examination showed a shift of the heart to the right to unusual degree resulting in an acquired dextrocardia Unusual electrocardiographic findings also appeared, consisting of unusual T waves At autopsy the heart was found perfectly normal and without right ventricular hypertrophy in spite of the chronic pulmonary disease and the distortion of the heart that had been caused by the thoracoplasty

TUBERCULOSIS IN NEW YORK CITY DURING 1948

Three thousand one hundred and five deaths from tuberculosis were recorded in New York City during the year 1948, according to the Department of Health of the City of New York, which was 23 fewer than the 3,128 reported in 1947 The death rate of 38 4 per 100,000 in 1948 was 2 per cent lower than the rate in 1947 which was 39 3, as reported by Godias S Drolet, statistician and assistant director, New York Tuberculosis and Health Association

While for the city as a whole there was a decline in tuberculosis mortality, on the other hand, in the Borough of Manhattan the deaths in 1948 which numbered 1,469 were 68 more than the year before The death rate, already extremely high in that borough, which in 1947 was 73, rose to 76 or by 4 per cent. The number of tuberculosis deaths in Brooklyn, 799, were the same as the year before In the Bronx, the 389 deaths in 1948 were 53 fewer than those in the previous year and last year's rate of 25 4 was 13 per cent lower than that in 1947 when it was 29 3 In Queens, the 367 deaths were 45 fewer than the year before and that borough enjoyed again having the lowest tuberculosis death rate in New York City, 24 as compared with 27 6 in 1947, a decline of 13 per cent

However, while tuberculosis mortality in New York City has fallen in 1948, it cannot be said that the incidence of the disease is any less. This probably reflects increasing success in the treatment of the disease what with extensive hospitalization, the wide application of surgical procedure in pulmonary tuberculosis, and now the valuable adjunct of the antibiotics, penicillin and streptomycin particularly

TORSION OF THE LESSER OMENTUM

LEONARD K STALKER, M D , and J COLMAN KNOPE, M D , Rochester, New York
(From the Department of Surgery, Highland Hospital)

TORSION of the greater omentum is a rather common condition, but torsion of the lesser omentum is rare and has been reported on only a very few occasions Hartwell reported one case of torsion of the lesser omentum which simulated subacute perforation of a gastric ulcer [1] Green mentioned the possibility of torsion in a discussion of traumatic rupture of the lesser omentum.[2] He cited this as a cause of intra-abdominal hemorrhage which occasionally required emergency surgery Bierman and Jones described an accessory or third omentum and its probable development [3] This is a triangular fold of omentum that hangs down from the lesser curvature of the stomach They mentioned that, at times, symptoms of a gastric ulcer were produced by its presence. Others have considered this accessory omentum as a potential source of torsion

A recent case of torsion of the lesser omentum which required emergency surgical treatment was thought to be of sufficient interest to report.

Case Report

A fifteen-year-old girl was referred to us on March 18, 1948, for surgical treatment of what was thought to be an advanced acute retrocecal appendicitis She stated that she had been well until approximately eight hours before admission to the hospital, when upon arising she felt a sudden, sharp, severe right epigastric pain This pain persisted throughout the day and was associated with nausea and vomiting There was no radiation of the pain and no other abdominal symptoms Some two years prior to this episode, the patient states that she was struck in the upper abdomen by a volley ball and that immediately severe pain developed in the epigastrium. She was confined to bed for several days, and her doctor at that time told her that she had an intra-abdominal hemorrhage

Examination at the time of admission to the hospital revealed a well-developed, well-nourished, white female who appeared acutely ill. Her blood pressure was 120/70 and the pulse rate 100 Her temperature was 100 F The leukocytes numbered 17,500, with 88 per cent neutrophils Urine examination was negative. There was definite tenderness in the lower right quadrant of the abdomen Rectal examination revealed nothing significant in the pelvis, but there was some right-sided abdominal tenderness It was felt that the patient presented a definite picture of an acute abdominal condition, and the most possible situation seemed to be that of an acute retrocecal appendicitis There was considerable doubt as to whether appendicitis existed or not, but surgical exploration was performed as an emergency procedure

The abdomen was opened through a low, midright pararectus incision A small amount of free serous fluid was present The appendix was found in a completely retrocecal position with the tip lying several centimeters above the cecum in the region of the hepatic flexure of the colon There was a fecalith in the midportion of the appendix, but there was not sufficient inflammation to account for this patient's symptoms For this reason the incision was enlarged, and a more extensive abdominal exploration was carried out The gallbladder was thin walled and contained no stones Just to the left of the gallbladder a hard inflammatory mass could be felt When this mass was visualized, it proved to be a gangrenous tab of omentum which was twisted on itself in a counterclockwise fashion some three times It was attached to the lesser curvature of the stomach in the prepyloric region just below the angle of the stomach This appeared to be a portion of the gastrohepatic omentum The stomach in this region showed considerable edema with serous inflammation which we felt was secondary to the inflammatory changes in the omentum This portion of omentum was resected and an appendectomy carried out Pathologic report showed that the resected tissue was fat which contained thrombosed vessels. The patient made an uneventful convalescence and was out of bed on her third postoperative day and discharged from the hospital on her tenth postoperative day

Comment

It is not normal for a portion of the lesser omentum to be free within the abdominal cavity so that a torsion could develop Therefore, one must speculate as to the method by which a portion of this omentum can become free In this particular case it was a portion of the gastrohepatic omentum, and we believe it is reasonable to assume that the trauma which the patient received two years previously produced a rupture of the lesser omentum, and, secondarily, a free tab of omentum was present which subsequently became twisted As we have mentioned, some authors state that this is really an accessory omentum or a third omentum, and they have described the embryologic development of such a situation. It is our feeling that in most of the instances reported in the literature the torsion was a traumatic condition, that is to say, that primarily a traumatic rupture of the lesser omentum had occurred It is obviously a rare condition but it is certainly one that must be thought of when exploration is carried out for an acute condition of the abdomen It is important when doing surgery within the abdomen that sufficient pathologic findings be demonstrated to explain the clinical picture as presented by the patient This frequently requires a very complete search of the abdomen as was carried out in this case. The preoperative diagnosis was that of an acute retrocecal appendix and at the time of surgery a retrocecal appendix was found, but, since there were not sufficient pathologic changes to explain the symptoms, a more complete exploration was carried out and the torsion discovered

Summary

A brief discussion of the problem presented by torsion of the lesser omentum has been made A case in which this condition occurred requiring emergency abdominal operation, has been presented

MULTIPLE SCLEROSIS APPEARING AFTER SPINAL ANESTHESIA

ARTHUR N FLEISS, M D , Syracuse, New York

(From the Departments of Medicine and Psychiatry, Syracuse University College of Medicine, and the University Hospital)

THAT neurologic complications of great variety may infrequently follow the use of spinal anesthesia has long been known They may be in the nature of isolated or multiple cranial nerve palsies, peripheral mononeuritis or polyneuritis, transverse myelitis, encephalomyelitis, or myeloradiculitis Thus, any portion of the central nervous system may be involved It has also been recognized that several clearly defined neurologic syndromes have been aggravated by or even precipitated by spinal anesthesia Hammes recorded a case of multiple sclerosis and one of posterolateral sclerosis associated with pernicious anemia in which spinal anesthesia induced rapid clinical progression of the neurologic defects [1] Critchley described a case of multiple sclerosis and another of progressive muscular atrophy in which the first neurologic abnormalities appeared immediately after spinal anesthesia [2]

Spinal anesthesia is not knowingly used in the presence of any central nervous system abnormalities In those instances where recognized neurologic syndromes were apparently precipitated by the anesthesia, it is likely that subclinical defects had existed which could not be elicited by our present methods of neurologic testing Without the added stimulus of the anesthesia, the disease would probably have appeared more gradually at a later period

The following case illustrates the appearance of multiple sclerosis immediately after spinal anesthesia

Case Report

A veteran, age thirty-six, had had difficulty with his feet for many years, which was attributable to the presence of a bunion and a hammer toe on the left foot as well as bilateral flat feet In March, 1947, the bunion and hammer toe were surgically corrected Spinal anesthesia with pontocaine was used Preoperative neurologic examination was normal

Immediately after the operation the patient first noted difficulty with his right, the unoperated, leg in the form of unsteadiness in his gait and an inability to raise the leg high enough to permit him to take a normal step Occasional nonradiating pain in the right hip and in the back was also described along with fatigue in both legs, more marked on the right The patient also experienced clonic movements in the right ankle when he stepped up

There was some minor complaint of constipation but of no other sphincter disturbances His sexual potency was unchanged He had not been aware of any eye or speech disorder, and other complaints referable to the nervous system were absent

The patient's past history included the notation that he had been subjected to routine medical examinations during his army service in the last war, and no neurologic defects had been found

When the patient was first seen by the writer, six and one-half months after his operation, neurologic examination revealed the following

1 Pupils were equal and round but reacted sluggishly to light and convergence

2 Horizontal nystagmus on lateral gaze, more toward the left, and vertical nystagmus on vertical gaze were present

3 Visual fields revealed bilateral peripheral constriction, more marked in the left eye, scotomata were found in both central fields

4 Right optic disk showed temporal pallor

5 Increased tonus in the lower extremities, weakness of the right thigh and leg, weakness of trunk flexion, and flaccid, pendulous abdomen

6 Reflexes

	Right	Left
Biceps	2	2
Triceps	3	3
Hoffman	0	0
Patellar	3	3
Achilles (clonus)	4	4
Plantar—pathologic no flexion	0	0
Upper Abdomen	2	2
Lower abdomen	1	1
Cremasteric	3	2

7 Normal appreciation of pain, touch, vibration, and position

8 Gait was ataxic, Romberg negative, heel to knee test bilaterally defective, and finger to nose test very slightly defective on the right

9 The remainder of the physical examination was not contributory Severe pes planus was evident bilaterally

Laboratory data were as follows Spinal fluid was clear and colorless Manometric readings were normal Spinal Wassermann test was negative There were 4 mononuclear cells Colloidal gold test (new scale 0 to 20) showed the following 8 5, 9 5, 13, 15, 16, 18, 15, 11, 8 These findings constitute a D type of curve, formerly designated as paretic or first zone Total protein was 46 mg (normal—15 to 25 mg) Blood Wassermann test was negative Complete blood count was normal Urinalysis was unremarkable

Comment

The presence of pyramidal tract and cerebellar tract abnormalities with nystagmus, optic neuritis and the spinal fluid changes constituted a characteristic picture of multiple sclerosis which first became evident after the operative procedure The medical as well as the legal implications of this problem emphasize the importance and value of a thorough neurologic review before a patient is subjected to spinal anesthesia

THE NEEDS OF THE ARMY MEDICAL SERVICE, I

COLONEL C F ST JOHN, First Army Surgeon,
New York City

GERMS recognize no pacts of peace—and, because of that, the Army Medical Department today faces a tremendous challenge

That challenge can best be summed up in the definition of the Army Medical Department's mission—to keep the soldier well and to care for him when he is sick This mission continues both in war and in peace Because it must constantly combat disease and be alert, the Medical Department is in a constant state of preparedness

As every doctor knows, he is the fulcrum around which adequate medical care revolves Without a sufficient number of doctors, no medical program—no matter how well conceived and how highly dedicated—can ever succeed

As of October 1 of this year, the Army will be 1,300 doctors, or 30 per cent, below the necessary strength. This shortage will result from the loss of the doctors who have received their professional education under the Army Specialized Training Program and will have completed two years of duty by this time While the Medical Department is under no compulsion to release these men, nevertheless it feels that is the fairest thing to do

The gravity of the situation, however, should not be underestimated The Undersecretary of the Army, William H. Draper, Jr , said recently, "There is now serious doubt that there are sufficient doctors to provide the necessary medical care of personnel on active duty"

Three alternatives face the doctors and the people of the United States at this time

1 The Secretary of Defense can ask for a draft of physicians

2 Physicians who already served in World War II and who have reserve commissions can be asked to come back.

3 Volunteers have been asked for from among 8,000 doctors educated under the Army Specialized Training Program, who have not served, and 7,000 doctors who were deferred to complete their own education, and who have not served

The Army feels that these 15,000 doctors who saw no service will recognize and realize that their professional colleagues recognize their moral responsibility in this emergency

The Army Medical Department has much to offer Some of the most far-reaching developments are the Intern and Resident Training Programs which have been established Under the Intern Program, a qualified medical school graduate may enter the Reserve—as a first lieutenant and receive full military pay and allowances for the length of his internship He may take internship at either an Army general hospital or at a civilian hospital of his own choice If he serves in an Army general hospital he incurs no further obligations If he interns in a civilian hospital under this program, he is obligated to serve two years on active duty and apply for a Regular Army Commission Under the Resident Program, a qualified medical school graduate who has completed internship, either as a Reserve officer or as a civilian, may accept a commission as a first lieutenant or a captain in the Regular Army The grade depends upon his experience He will receive full military pay and allowances for the duration of his residency, either at an Army general hospital or at a civilian hospital of his own choice

The Army Intern Program is a fine opportunity for young doctors Financially, with his military pay, the young intern is much better off than he would be in civilian life He benefits, and the Army benefits by his services The Residency Program is an excellent way for a young physician or surgeon to come into the Regular Army and make Army medicine his career It affords him the opportunity to complete his specialist training to meet the qualifications of the Specialty Boards He is given every encouragement in this, because the Army wants to increase the number of medical officers who have met Specialty Board requirements

But, Reserve interns and the Regular Army residents are not enough to meet the immediate needs of the Medical Department Today's need for a large peacetime Army and Air Force has made it necessary for Congress to increase the number of those on full-time duty far beyond the limit set for the Regular Establishment Actually, then, the crucial need is for doctors who will accept Reserve commissions and go on tours of active duty for one, two, and three years Ideally, the Army needs a procession of these, so that as one group completes its tour another group begins its tour

What, then, does the Army offer the doctor who takes a Reserve commission and enters on a tour of duty? It offers him a commission in a grade up through colonel His experience determines his grade All doctors and surgeons are commissioned at least as first lieutenants, in recognition of their advanced education The doctor will work in his specialty He will improve his proficiency He will have the benefit of association with other doctors. He will be able to share their experiences, enlarge his knowledge of medicine He will become eligible for retirement benefits which accrue to Reserve Officers. Combinations of active duty and time spent in the Reserves add up to retirement privileges in the future Never before have so many inducements existed for Reserve Officers

39 WHITEHALL STREET
NEW YORK CITY

(NOTE The second article on this subject will appear in the May 15 issue.)

CORRESPONDENCE

IMPOTENTIA

To the Editor

I wish to comment on the article, "Impotentia," by Jesse G Keshin and Bernard D Pinck in the February 1, 1949, issue of the NEW YORK STATE JOURNAL OF MEDICINE The criticism I have to offer is based more on emphasis than on actual inaccuracies The authors, in stressing the etiologic factors in disturbances of potency, describe the various somatic causes with only brief mention of psychic factors In discussing treatment the authors finally state, "Logically, the study of cases of impotence falls to the care of the urologist because of his training in diseases of the genitourinary tract and his consequent ability to rule out any organic lesions which may be causing impotence" This is somewhat analogous to saying that, inasmuch as all psychiatric cases, be they neuroses or psychoses, have a disturbance or potency of one type or another, they should be treated by the urologist Most workers in the field have accepted the fact that impotence is generally a psychiatric problem, except for the unusual case showing an endocrinologic, neurologic or other somatic disturbance It's a well-accepted dictum that neurotics rarely reach full sexual maturity or potency and that many individuals who superficially give no evidence of neurosis are nevertheless suffering from various conflicts with the resultant disturbances in their sexual lives

The psychiatric literature on this subject is vast, and I would particularly refer the authors to the writings of Bergler, Hitschmann, Stekel, Menninger, and others

I would also recommend to the authors that not only "the cases which are purely psychic" but all cases having potency complaints be examined by a psychiatrist trained along dynamic lines They will be astounded at the increased importance psychogenic factors assume in this condition

HYMAN S BARAHAL, M D
West Brentwood, New York
February 5, 1949

Reply by Dr Keshin

To the Editor

In answer to Dr Hyman S Barahal's letter, I would like to make the following comment

Dr Barahal takes issue with our article on the basis of its emphasis on the physical aspects of impotence While we are well aware of the importance of psychiatric factors in the etiology as well as the reaction to the symptoms itself, we would still emphasize that organic disease may play a role in these cases and should be definitely ruled out before therapy of any type is attempted Just as the psychiatrist would not begin psychotherapy without an examination to rule out organic disease, we feel that impotence, being a somatic disorder of the genitourinary tract, deserves a systematic urologic examination to rule out organic disease

Since the physiology of impotence is not yet clearly understood, we do not attempt to overemphasize the importance of any one approach to the exclusion of another It is our responsibility, however, to rule out any organic condition which may be related to the symptom. Much research remains to be done before we can be sure of the relative importance of the organic or psychic pathology in impotence

We are in full agreement with Dr Barahal regarding the psychoneurosis of many of these patients and their need for psychotherapy If, after thorough physical examination, organic factors are eliminated, when psychotherapy is instituted it proceeds more effectively, since the initial urologic examination reassures the patient that all possible aspects of his disorder are being investigated The fact that all details, no matter how minor they may seem, are being specially handled helps to establish the patient's faith in all physicians who will be concerned in the future handling of his problem

As we have pointed out in our article, there is a great need for teamwork by men in related fields for the successful care of the impotent patient There is a danger in our zeal as specialists to become entirely immersed in our own field with the exclusion of contributions from allied branches of medicine In not doing a thorough physical and urologic examination, we may be neglecting an important aspect of the condition We take the broader view of first evaluating the nature of organic factors and then calling upon qualified men in related specialties to help us in the solution of the complex problem of impotence

J G KESHIN, M.D

610 West 110th Street
New York 25, New York
February 25, 1949

DR FROTHINGHAM REPLIES

To the Editor

My attention has been called to an editorial in the NEW YORK STATE JOURNAL OF MEDICINE under the date of February 1, 1949, in which you mention my name in such a way that I gather you would like to receive a letter from me to be published in your JOURNAL

Referring to the sixth paragraph of your editorial, one naturally cannot expect a decision to be published before it is made, but I think one can expect that a body which describes itself to be representative of the opinion of the practicing physicians should make some effort to find out what the prac-

ticing physicians think about a certain subject before reaching a decision in regard to it

In the seventh paragraph you ask for a frank disclosure of the source of the funds which finance the Committee for the Nation's Health. I presume that there is no intimation on your part that there is any secrecy on our part as to whence our funds come, for along with the American Medical Association and other professional or lay organizations which are interested in lobbying activities we make quarterly reports to the Congress of the United States These reports are public documents All gifts of $500 and over are made public by name This Committee for 1948 was given $44,250 by nine persons who contributed $500 or more Smaller gifts from over three hundred persons amount to $3,670

In the third paragraph of your editorial I think one is justified in assuming that you imply that certain people are not officers of the Committee for the Nation's Health by the use of the word "claim" The list of the officers and board of directors of the Committee for the Nation's Health is on this letterhead They *are* our officers and many of them have worked and are working hard in behalf of the purpose for which this Committee was established, namely, the enactment of a National Health Program, the central feature of which is National Health Insurance designed to make adequate medical care available to all the people

I am delighted that you have taken the attitude in your editorial that in order to settle the question of compulsory sickness insurance versus voluntary health insurance plans you ask for "cold, hard facts" I challenge you to find any statement that has been put out by our Committee which is not a matter of fact, and if so I think that proper apology for the mistake will be made In the same spirit of fairness may I ask that you adhere to facts in your publications and urge those interested in your philosophy to do so likewise, and if any one on your side presents statements which are inaccurate I trust that you will be as willing to correct them as our group is

May I call your attention to a letter published in the *New England Journal of Medicine* under the date of February 17, 1949, calling attention to an appreciable number of misstatements of fact and misleading innuendos which appeared in Dr William B Rawls's inaugural address on assuming the presidency of the Medical Society of the County of New York If you want "cold, hard facts" as you asked for in your editorial of February 1, you certainly ought to see that this letter is reproduced in your JOURNAL.

Another set of "cold, hard facts" which have not been relayed to the profession and the public through the medical press is the statement in the Report of the Hearings before the Committee on Education and Labor, Part 5, Page 2679, June, 1946, in which statements on the part of the National Physicians Committee were shown to be inaccurate by quotations from the *Journal of the American Medical Association* If you are really interested in seeing that the medical profession is properly informed on this subject of Compulsory Health Insurance, you should call attention to the misstatements that have been put out over the years by the National Physicians Committee

Furthermore, in the same spirit I think you should endeavor to correct the misstatements printed in the *Journal of the American Medical Association* about the program in England for the delivery of medical care

I trust that you are sincere in your desire for publicity of the truth and only the truth by both sides of this controversial subject, and, if you are, I hope that you will publish this letter in your JOURNAL as an answer to the points brought out in your editorial of February 1

CHANNING FROTHINGHAM, M D
Committee for the Nation's Health, Inc
February 28, 1949

In the February 1, 1949, issue we published the editorial, "Competition in Publicity," referred to by Dr Frothingham. This JOURNAL is indebted to him for his detailed reply We had no intention to intimate any secrecy on the part of the Committee for the Nation's Health as to the source of their funds, only to inquire how much and whence Anyone who had 309 generous disinterested friends in 1948 or any other year should be congratulated in this era of socialism, strikes, and surtaxes

We used the word "claim" in the editorial third paragraph since we took our information from a press release, not always entirely accurate as a news source

As to the rest of the letter, may we suggest that Dr Frothingham address the National Physicians' Committee directly —*The Editors*

AMERICAN BOARD OF PREVENTIVE MEDICINE

To the Editor

The American Board of Preventive Medicine and Public Health, Incorporated, was approved by the Advisory Board for Medical Specialties and by the Council on Medical Education and Hospitals of the American Medical Association at their meeting on February 6 The American Board of Preventive Medicine and Public Health, Incorporated, therefore, is prepared to accept applications for examination for certification in this specialty

The requirements for certification include general qualifications, such as moral and ethical standing in the profession, adequate training in medicine and internship in an approved hospital, and licensure to practice medicine in the United States. Eligibility for examination also requires that the applicant have special training and experience in preventive medicine and public health of at least six years following internship This must include special academic training, or its equivalent, and field training or residency, meeting the standards set up by the Board.

Applications may also be received for the Founders Group who may be excused from examination. The Bylaws authorize a Founders Group made up of practitioners of preventive medicine and public health who have attained unquestioned eminence in the field The Founders Group presumably will include persons having attained eminence as indi-

cated by academic appointments at the level of professor or associate professor of preventive medicine and public health, or who have held positions of eminence and responsibility for a period of not less than ten years in this field

"THE DOCTORS ACT"

To the Editor

Your editorial, "The Doctors Act," in the March 15, 1949, issue of the JOURNAL, has stimulated the writer of this letter to some action of his own

It cannot be denied that the health status of the American people has reached a high level, and that the American Medical Association has played a very important role in many of the major achievements in the health field

Your editorial properly lists "high quality sanitation" first on the list of accomplishments which benefit the public You do not state, however, that sanitation is generally developed through the activities of public health departments, and, consequently, has always been under governmental sponsorship and control You also omit mention of the fact that even up to the present time public health departments encounter serious opposition on the part of components of the American Medical Association to some of their activities

The present alleged espousal of the cause of voluntary health insurance by the American Medical Association is not convincing in view of the recent rejection of General Hawley's plan to establish a national enrollment agency which would permit the Blue Shield plans to compete successfully with commercial insurance companies The passive and active resistance to voluntary insurance plans other than those under medical society sponsorship has surely not encouraged "further development and wider coverage by voluntary hospital and medical care plans" One cannot forget that not so very long ago the American Medical Association assured us that even voluntary health insurance was but a short step removed from communism.

The avowed interest of the American Medical Association in "greater emphasis on the program of industrial medicine" is difficult to reconcile with the recent announcement of the A M A that it has suspended publication of its journal *Occupational Medicine* This appears to be emphasis in a negative direction

There is another matter which would seem to be sufficiently important to call for mention in the JOURNAL I refer to the rejection by the medical societies of Kings and New York Counties, representing nearly one half of the physicians in New York State, of the American Medical Association's proposed $25 assessment Indeed, as you say, "The Doctors Act"

LEONARD J GOLDWATER, M.D
600 West 168th Street
New York City
March 15, 1949

Comment

Dr Goldwater scolds us for omitting to state that "high quality sanitation" is developed by public health departments So it is We assumed that most physicians knew that "Program of the A M A for the Advancement of Medicine and Public Health, 1949," paragraph 6, calls for "Establishment of local public health units and services and incorporation in health centers and local public health units of such services as communicable disease control, vital statistics, environmental sanitation, control of venereal diseases, maternal and child hygiene, and public health laboratory services Remuneration of health officials commensurate with their responsibility" If this is opposition, we should buy a dictionary

As to voluntary health insurance, we can only refer Dr Goldwater to the above quoted program of the A M A, 1949, paragraph 3, which calls for "Further development and wider coverage by voluntary hospital and medical care plans to meet the costs of illness, with extension as rapidly as possible into rural area Aid through the states to the indigent and medically indigent by the utilization of voluntary hospital and medical care plans with local administration and local determination of needs" As to the A M A 's alleged assurance that voluntary health insurance was "but a short step removed from communism," we ask Dr Goldwater what, in his view, would be the longevity of any voluntary health insurance under communism?

Dr Goldwater asks us about suspension of *Occupational Medicine*, a publication of the A M.A. We do not know why it was suspended, except possibly because of exorbitant costs of paper and manufacture, these have nothing to do in our view with the interest of the A.M A in actively promoting "Greater emphasis on the program of industrial medicine, with increased safeguards against industrial hazards and prevention of accidents occurring on the highway, home and on the farm"

The action on the $25 assessment of the A M.A taken by the medical societies of New York and Kings Counties is important. It shows that we still have a working democracy in this country The right of the individual to think and believe as he chooses and, within the law, to act as he pleases is not yet abridged Since the payment of the A M A. $25 assessment is a voluntary matter, the physicians in the societies named must determine for themselves what they will or will not do

We had assumed this to be so much a matter of course that *until Dr Goldwater raised the question* of its sufficient importance we had not thought it necessary to give it editorial comment —*Editor*

THE DIRECTORY

To the Publication Committee

I have just received my copy of the 1949 *Directory of the Medical Society of the State of New York*, and wish to compliment you and the other members of the Editorial Board for the excellence of this issue

The arrangement of material, accuracy of detail, and wealth of information contained in this volume makes it invaluable to everyone practicing in this vicinity, and I think that it is probably the best medical directory in the world

Probably everyone does not realize the necessary attention to detail and the tremendous task involved in its compilation, but I hope that those concerned in the undertaking will receive other letters of commendation in addition to mine, so that they will feel that all their hard work has been worth while

WALTER T DANNREUTHER, M D

New York City
March 10, 1949

NOTE Comments, suggestions, and criticism would be appreciated and will be given careful consideration by the Publication Committee

COMPARES COSTS OF MEDICAL CARE WITH COST OF LIVING INDEX

Costs of medical care have not risen as fast as the cost of living, a comparison of the 1948 Consumers' Price Index with a preliminary index of medical care prices of the United States Bureau of Labor Statistics shows Writing in the February 26 issue of the *Journal of the American Medical Association*, Frank G Dickinson, Ph D , Chicago, director of the Bureau of Medical Economic Research of the American Medical Association, says the bureau estimates from United States Bureau of Labor Statistics figures that the index of medical care items will stand at 141 for 1948

Preliminary figures of the Bureau of Labor Statistics for costs of medical care in 1948 are General practitioners' services, 136, surgeons' and specialists' services, 136, dental care, 146, eyeglasses, 124, hospital rates, 212, and prescriptions and drugs, 122

Figures of the Bureau of Labor Statistics for these items in 1947 were 130 3, 129 4, 137 4, 118.6, 179 6, and 115 4, respectively The entire cost of living index for 1947 was 159 2 "The most significant change is in hospital rates, which soared from 179 6 in 1947 to 212 in 1948 "

EXTRAVAGANT TAXES

Dr R B Robins, a member of the A.M A. House of Delegates, charged that "The Federal government, by extravagant tax demands which constitute a dangerous drain on family income, is forcing lower living standards on millions of the American people and is taking away earnings which they badly need for adequate diet, clothing, and shelter "

"That's the most serious health and economic problem which confronts this country," said Dr Robins, "and it's about time we got it out in the open and talked about it The compulsory health insurance program is a pitiful political attempt to treat symptoms, instead of getting at causes "

Dr Robins, who is from Camden, Arkansas, and who is the Democratic National Committeeman from that state, declared "The real problem in most American homes is the tax bill, not the medical bill In most income classes, according to the findings of the Brookings Institution, the cost of medical care represents about 4 or 4.5 per cent of family income But the tax bill is draining away from 20 to 30 per cent of earnings, even in the low and middle income groups

"It's a little hypocritical, under the circumstances, for Federal Security Administrator Oscar Ewing to be beating the drums for compulsory health insurance as a cure for the people's ills If he wants to make a real contribution toward improving the public health in America, he should do something about cutting costs in his own towering bureaucracy and in the other departments in Washington which are literally taking food out of the mouths of the people In lower income groups, malnutrition is at the bottom of much of the disease in America and Oscar Ewing should know it."

"The real reason for the high-pressure drive for compulsory health insurance," said Dr Robins, "is that the supporters of political medicine see the opportunity for establishing a medical bureaucracy slipping through their hands More than 52 million people in this country already have provided themselves with voluntary health insurance to cushion the economic shock of illness That's a splendid start toward meeting the problem and our campaign will be designed to make all the people of the country health insurance conscious—and let them know that the finest kind of medical care can be bought on a prepaid basis, without government interference or political meddling

"The voluntary health insurance systems, during the past ten years, have had a phenomenal growth—and the real demand is for voluntary health insurance, not compulsory Mr Ewing undoubtedly knows that, and within the next two or three years, if government stays out of the business, the problem will have been largely resolved That may explain the great haste in Washington to jam through a compulsory health insurance program at this session of Congress The socializers see their opportunity rapidly disappearing "

DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL, DIRECTOR

THE greatest yearly membership gain experienced by the six nonprofit voluntary medical care insurance plans in New York State, approved by the Medical Society of the State of New York, was realized in 1948 Membership increased by 515,644 to a total of 1,539,259 as of December 31, 1948, which represents the highest enrollment of any state in Blue Shield plans

Gain in each plan and membership total at December 31, 1948, was as follows

United Medical Service, New York, gain 398,674 total 1,128,967

Western New York Medical Plan, Buffalo, gain 40,163, total 159,871

Medical and Surgical Care, Utica, gain 20,594 total 109,963

Genesee Valley Medical Care, Inc , Rochester, gain 22,508, total 68,653

Northeastern New York Medical Service, Albany, gain 28,921, total 51,699

Central New York Medical Plan, Syracuse, gain 4,784, total 20,106

Incurred benefits to members were $6,369,388, an increase of $2,687,833 over 1947, or 73 per cent

For medical care of subscribers and dependents, $6,017,004 was paid to doctors during 1948 as compared with $3,529,697 in 1947, an increase of 70 per cent This amount paid for a total of 155,435 claims as compared with 111,592 in 1947

The total number of participating physicians in the six plans is 20,883, an increase of approximately 3,800 during 1948

The Medical Society of the County of Chautauqua has voted to establish a plan for the population of the county, to be operated by the local Blue Cross plan in Jamestown, and is to be known as the Chautauqua Region Medical Plan This project is in the formative state, and a detailed statement will be made in these pages at a later date.

Present increase in enrollment points to added interest by the public in the medium of insurance as protection against the costs of medical care, and there is definitely a stronger interest on the part of the medical profession to participate in and further the publicizing of the plans The present legislative trend in Washington has awakened both the public and the doctors to the importance of maintaining the free practice of medicine unencumbered by any government intervention This can be accomplished only through the voluntary insurance principle of providing for medical care costs on a prepaid basis.

A joint meeting of the Subcommittee on Medical Expense Insurance and plan presidents was recently held to consider a uniform State-wide contract. It was unanimously agreed by the Committee that a contract combining both service and indemnity features should be considered, the point of distinction being income levels.

The contract will provide surgical, in-hospital medical care, with surgery in the home, hospital, or doctor's office, and will include maternity and fractures

The actions of the Subcommittee were submitted to the Council of the State Society at the March 10 meeting and were accepted in principle

---

HOSPITAL NEWS

Intern Shortage in City Hospitals Seen

HOSPITALS in New York City will have a shortage of interns starting July 1, it was announced in the March *Bulletin* of the Hospital Council of Greater New York.

For the nation as a whole, the council said that the number of internships available exceeded the number of medical graduates by almost 4,000 It predicted that this discrepancy would be large enough to produce serious dislocations in the operation of many hospitals.

The council contended that "complete coordination among the hospitals, medical schools and the approved bodies of internships is essential if the internship is to serve the best interest of the interns and the patients"

In the sixty hospitals in New York City that are approved for internships, the council said "only 17 per cent have appointed all the interns they require eight of the hospitals have made no appointments at all, and thirty-five have appointed some interns" "The sixty hospitals have appointed 744 interns for the year 1949–1950," the bulletin reported "No additional interns will be available, since all the medical graduates have accepted positions"

The hospitals report a need for 284 additional interns

Teaching hospitals have fared better than nonteaching ones in New York City as well as for the country as a whole The report pointed out that since internships were designed primarily for training of young physicians, the medical graduates were expected to seek the internships in teaching hospitals.

Of the total number of internships offered in the country in 1947, 46 8 per cent were in teaching hospitals and 53 2 per cent in nonteaching hospitals. Teaching hospitals reported 8 6 per cent of their positions unfilled, while 34.2 per cent of the positions in the nonteaching hospitals were vacant.

Presbyterian Hospital President Reports

AT THE annual meeting of the Board of Trustees of Presbyterian Hospital, New York City, held on March 28, Mr Charles P Cooper, president, gave his annual report and summarized the past year's work.

In his analytical report, Mr Cooper credits free enterprise in medicine as the single factor responsible for actually increasing the life expectancy of Americans in the last fifty years, from 46 to 67 years, an extension of life greater than had been achieved in the previous 2,000 years Mr Cooper reported that in 1948 the Hospital suffered a net loss of $264,206 in serving a total of 84,227 clinic and bed patients at a cost of $10,796,707

Ascribing American leadership in medicine "to our unconquerable spirit of free enterprise," he credited the same spirit for "providing the means and desire to underwrite in a volunteer fashion the costs of medical advancement"

Noting that approximately 27 per cent of the total of bed patient days represented Blue Cross subscribers, the president stated "The spread of voluntary prepaid medical insurance over larger numbers of people should be encouraged. By means of insurance, patients have the moral satisfaction of paying their own way" Concerning the government's proposed health legislation, Mr Cooper said "Every hospital should welcome free discussion in the press and in our legislatures regarding hospital problems and the quality of medical care Citizens should have the facts put before them so that they may form intelligent opinions as to how far the State should go in altering medical procedures which have proved successful"

Appoint New Directors for State Hospitals

NEW directors have been appointed for four State hospitals, according to an announcement by Dr Frederick MacCurdy, State Commissioner of Mental Hygiene

Dr Francis J O'Neill, former assistant director of the Central Islip State Hospital, assumed the post of director of the Utica State Hospital, effective April 1

Formerly senior director at the Harlem Valley State Hospital, Wingdale, Dr Alfred M. Stanley was transferred on April 16 to the Rockland State Hospital, where he will be senior director

Dr Leo P O'Donnell, now director of the Newark State School, will be promoted to the position of senior director at the Harlem Valley State Hospital, effective May 1.

Taking up new duties as director of the Rochester State Hospital will be Dr O A. Kilpatrick, who effective April 16, has been promoted from his post as acting director at Rockland.

NEWS NOTES

Dr Melvin H Knisely, chairman of the department of anatomy of the Medical College of the State of South Carolina, gave the fourth of the series of Dr Henry Joachim Lectures on the application of fundamental sciences in medicine on April 27, at the Jewish Sanitarium and Hospital for Chronic Diseases, Brooklyn Dr Knisely's topic was, "Sludged Blood and Its Clinical Implications"

Dr Harry Klapper was re-elected president of the staff of St Agnes Hospital, White Plains, at the annual meeting of the medical staff and board of governors held March 31 Other officers are Dr Grosvenor White, head of the pediatric division vice-president, and Dr Daniel MacDonald, attending physician, secretary

At the meeting it was reported that there have been no maternal deaths in the hospital in the past eighteen months, during which period 1,800 babies have been born

Dr Arthur Pense, acting director of Utica State Hospital, until December 1, 1948, and Dr Harold A Pooler, former assistant director who succeeded Dr Pense as acting director, were honored at a farewell party March 17, given by the hospital employes Dr Pooler has been appointed superintendent of the 1,300-bed Bangor State Hospital, at Bangor, Maine

The Edward Gamaliel Janeway Lecture at Mount Sinai Hospital, New York City, was delivered on April 11 by Dr Emanuel B Schoenbach, associate professor of preventive medicine and assistant professor in medicine, Johns Hopkins University School of Medicine, Baltimore His topic was "The Newer Antibiotics Polymyxin, Chloromycetin, and Aureomycin"

The Hospital for Special Surgery, New York City, oldest orthopedic hospital in the United States, has affiliated with the New York Hospital, it was announced on March 24 The Hospital for Special Surgery will move to a new 170-bed hospital for orthopedics and arthritis, to be erected on East River Drive next to the New York Hospital-Cornell Center It was emphasized that the action is not a merger, since both institutions will continue as separate corporations, but that each will avail itself of the experience and facilities of the other

The second nutrition clinic of the New York City Department of Health was officially opened in the Red Hook Gowanus District Health Center, Brooklyn, on April 6 The Brooklyn clinic will offer a consultation, diagnostic, and follow-up service to children and others over six in low income groups, who are suspected of having nutritional abnormalities

A citation, signed by King Haakon of Norway was presented to the White Plains Hospital on March 19 by Consul-General Erling S Bent of the Royal Norwegian Consulate The hospital had maintained a wing from 1941 to 1947 for the treatment of Norwegian seamen

The Greater New York Hospital Association will hold its annual dinner on National Hospital Day, May 12, at the Hotel Roosevelt, New York City, at 7 00 P M Speakers will be Dr Eli Ginzberg, director of the New York State Joint Hospital Survey and Planning Commission, and Mr George Sokolsky, newspaper columnist and radio commentator

---

WORLD MEDICAL ASSOCIATION

The World Medical Association formed in Paris in September, 1947, is hopeful of bringing about a uniform high standard of medical education throughout the world, according to Dr Louis H Bauer, of Hempstead, New York, secretary-general of the Association, who spoke on February 7 at the 45th annual Congress on Medical Education and Licensure, sponsored by the American Medical Association and meeting at the Palmer House The World Medical Association is made up of national groups in 39 countries.

Dr Bauer detailed a survey made of medical schools of 26 countries The information included scholastic requirements, length of education, and courses "This study," he said, "affords all countries an opportunity to compare standards and methods with each other"

"In many instances the national medical associations criticize the standards and methods in their countries and make suggestions as to how they can be improved," he reported "It is believed that the World Medical Association, by publishing such a report and through its member associations can be of great assistance in bringing about a uniform high standard of medical education throughout the world"—*J.A.M.A., February 7, 1949*

NECROLOGY

Milton Bodenheimer, M.D, sixty-nine, died at his New York home on March 25 Dr Bodenheimer received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1903 and interned at Mount Sinai Hospital He later became attending surgeon on the staff of the Hospital for Joint Diseases and at the time of his death was consultant surgeon to that hospital. He was also president of the medical board at one time

Dr Bodenheimer served in World War I as a major with a hospital unit of the American Expeditionary Forces in France A founder-fellow of the International College of Surgeons, fellow of the American College of Surgeons, and a member of the founders' group of the American Board of Surgery, of which he was also a diplomate, Dr Bodenheimer belonged to the American Medical Association, the New York Academy of Medicine, and the New York State and County Medical Societies

Jonas Borak, M D, New York City, Viennese radiologist and one-time assistant to Dr Sigmund Freud, died of a heart ailment on April 4. He was sixty-four years old Dr Borak, a graduate of the University of Vienna in the year 1921, came to New York as a refugee in 1939 after serving four terms in Austrian prisons A cabled query from the American Medical Association as to his reported suicide resulted in his release from the last imprisonment where he was sent for writing an article denying the Nazi race theory He left for the United States shortly after this incident with a German passport given him by a Nazi official whose mother he had treated

Dr Borak served as assistant physician in the department of dermatology at City Hospital. He was a diplomate of the American Board of Radiology and a member of the New York Rheumatism Association, the New York State and County Medical Societies, and the American Medical Association

Hans Chase, M D, a forty-eight-year-old physician of Pulaski, died on January 31 Dr Chase was graduated from Goettingen in 1925 and at the time of his death was a member of the New York State and Oswego County Medical Societies and the American Medical Association

Joe Ramey Clemmons, M.D, of New York, died April 2 at the age of fifty-two Dr Clemmons, medical director and executive vice-president of Roosevelt Hospital until his retirement in January, received his medical degree from the University of Tennessee in 1924. After serving his internship at Macon Hospital, Macon, Georgia he became superintendent of that institution in 1926 Four years later he was named assistant director of Strong Memorial Hospital Rochester which post he held until his appointment to Roosevelt Hospital in 1937 During his directorship such innovations as ambulance service for the central west side area of the city a central supply department at the Hospital, and the construction of a new private patient's building, containing the most modern equipment, were instituted At Roosevelt, Dr Clemmons formed the first "catastrophe unit" in New York City The unit, consisting of two teams of doctors and three of nurses, designed to aid in the event of a war emergency, was organized in March, 1941, and functioned throughout the war under Dr Clemmons' direction

Shortly after World War II, he was cited by President Truman for his war service as chairman of the New York State Procurement and Assignment Service for Physicians of the War Manpower Commission, which recruited physicians for the armed forces In World War I he served in France with the 36th Division

Since 1939 he had been director of the Associated Hospital Service of New York. A past president of the Greater New York Hospital Association and a fellow of the American College of Hospital Administrators and the American Medical Association he was also a member of the American Hospital Association, the American Public Health Association, the New York Academy of Medicine, and the New York State and County Medical Societies

Stanton Curry, M D, seventy-nine, died on March 26 A practicing physician in Peekskill for more than forty years, Dr Curry received his medical degree from New York University Medical School in 1898 He was for many years examining physician for the New York Central System in Peekskill and since 1939 had been president of the Peekskill National Bank and Trust Company He was an honorary member of the staff of Peekskill Hospital and a member of the New York State and Westchester County Medical Societies and the American Medical Association

Carlton George Lee, M D, fifty-seven-year-old Highland Falls physician, died on March 25 Dr Lee served as a pilot in the first World War and in the United States Army Medical Corps in World War II At the time of his death he was a staff physician at the Veterans Administration Hospital Castle Point He was a member of the New York State and Orange County Medical Societies and the American Medical Association and was a licentiate of the Medical Council of Canada. Dr Lee was graduated from the University of Alberta in 1925

William Edgar Hurley, M D, died April 4 Dr Hurley aged fifty-two, was a plastic surgeon with offices in New York City and New Brighton, Staten Island He was a graduate of the class of 1920 of the Long Island College of Medicine After the first World War he had served with the Hoover Relief Mission in Kharnov, Russia and in 1928 was with the medical division of the American Relief Association

Martin Kerpel, M D, fifty-three, collapsed and died of a heart attack on March 15 Dr Kerpel was born in Germany, received his medical degree from the University of Berlin in 1922, and came to this country twenty-four years ago He was a member of the staff of Lutheran Hospital and belonged to the New York State and Kings County Medical Societies and the American Medical Association

Anthony J Manzella, M D, aged forty-eight died on February 24. Dr Manzella, a graduate of

the University of Buffalo, School of Medicine, in 1927, was a director of the Division of Communicable Diseases of the Erie County Health Department He was appointed to this post in 1948, having served the two years previous as deputy city health commissioner of Buffalo

After serving his internship at Buffalo City and Meyer Memorial Hospitals, Dr Manzella joined the staff of Black Rock Industrial Clinic until 1929 when he began private practice in Brooklyn While in Brooklyn, he attended New York Post-Graduate for study in cardiography and served as assistant attending physician at Cumberland Hospital and as clinical assistant at Long Island College Hospital In 1933 he started practice in Newburgh and in 1938 became city health officer He obtained the degree of master of public health from the Harvard School of Public Health in 1940 and resumed his private practice in 1942, remaining until 1946 when he was appointed to the city post in Buffalo

Dr Manzella had been a member of the New York State and Erie County Medical Societies, the New York State Health Officers Association, and the American Medical Association

Edward White Perkins, M.D, New York City physician for more than fifty years, died on March 26 He was eighty-three years old For many years associated with Sloane and Presbyterian Hospitals, Dr Perkins was a graduate of the College of Physicians and Surgeons, Columbia University, in the year 1889 He was a member of the alumni associations of Presbyterian and Sloane Hospitals, the New York State and County Medical Societies, and the American Medical Association

Emanuel Salwen, M.D, fifty-five-year-old Brooklyn urologist, died on April 4. Dr Salwen, an alumnus of the College of Physicians and Surgeons, Columbia University, class of 1917, served his internship at Mount Sinai Hospital At the time of his death he was associate urologist at Maimonides Hospital and urologist at Coney Island Hospital. A diplomate of the American Board of Urology and a fellow of the American College of Surgeons, Dr Salwen had memberships in the following organizations American Urological Association, American Medical Association, the New York and Brooklyn Urological Societies, and the New York State and Kings County Medical Societies

Henry Tucker Spelman, M.D, of Brooklyn, died recently at the age of sixty-four after a year's illness Dr Spelman was graduated from the College of Physicians and Surgeons, Columbia University, in 1907 Previous to his illness he had been an associate physician on the staff of Norwegian Hospital, Brooklyn, and medical inspector of the Bureau of Tuberculosis, Department of Health He was also a member of the New York State and Kings County Medical Societies and the American Medical Association

Howard Canning Taylor, M D, eighty-two, died at his New York home on March 27 Dr Taylor received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1891 and served his internship at Roosevelt Hospital. In 1913 he was named professor of clinical gynecology at the College of Physicians and Surgeons and had held that post ever since From 1910 to 1939 he was chief of the gynecologic division of Roosevelt Hospital and in recent years had been a consultant at that hospital He was also consultant gynecologist at Tarrytown Hospital and the Greenwich, Stamford, and Sharon Hospitals in Connecticut, the Horton Memorial Hospital in Middletown In addition he was associate visiting obstetrician and gynecologist on the staff of Bellevue Hospital

A diplomate of the American Board of Obstetrics and Gynecology and a fellow of the American College of Surgeons, he served as head of the National Research Council's Committee on Human Reproduction He was a past president of the American Society for the Control of Cancer, the American Gynecological Society, the New York Obstetrical Society, and the New York County Medical Society At the time of his death Dr Taylor held memberships in the American Medical Association, the American Public Health Association, the New York Academy of Medicine, and the New York State and County Medical Societies

Emil Rudolph Zak, M.D, a specialist in internal medicine and cardiology, died on March 22 at the age of seventy-two Born in Bruenn, Austria-Hungary, Dr Zak received his medical degree from the University of Vienna in 1901 where he did various types of research, eventually becoming professor of internal medicine He was at one time chief of the Heart Station, a hospital in Vienna, and had also been physician-in-chief of the Workmen's Sickness Benefit Fund in Vienna. After the coming of the Nazis to Austria, Dr Zak went to England and in 1940 came to the United States At the time of his death he was an adjunct physician and an assistant adjunct cardiologist on the staff of Beth David Hospital, New York. He was a member of the American Heart Association, the American Medical Association, and the New York State and County Medical Societies

---

RHEUMATIC FEVER AND THE SCHOOL CHILD

Recommendations.—To aid school health authorities to develop a more rational approach in the control of disease, the Committees on School Health and Rheumatic Fever of the American Academy of Pediatrics recommend (1) that the school medical examination be improved to aid in more accurate recognition and supervision of rheumatic children, (2) that more emphasis be placed on referral by teachers and nurses of pupils believed to be below par for medical review, (3) that less emphasis be placed on restricting the physical activity of rheumatic children and more attention given to daily observation of pupils for signs or conditions suggestive of rheumatic disease, (4) that there be available, to school health services and the practitioners, diagnostic and consultation services to establish diagnosis, and (5) that these services be developed in cooperation with, and by utilization of, existing medical and public health resources in the community

—*Committee on Rheumatic Fever, American Academy of Pediatrics, 1948*

MEDICAL NEWS

Maternal Mortality in the United States in 1947

MATERNAL mortality decreased to a new low in the United States during 1947, according to figures released by the National Office of Vital Statistics of the Public Health Service, Federal Security Agency The maternal mortality rate was 1 3 per 1,000 live births in 1947 as compared with 1 6 in 1946 The number of maternal deaths (associated with diseases of pregnancy, childbirth, and the puerperium) also decreased from 5,153 deaths in 1946 to 4,978 in 1947, despite the tremendous increase in the number of births.

In 1947, the maternal mortality rate for white women was 1 1 per 1,000 live births, while that for nonwhite women was 3.3, or 3 times as great

The risk of dying associated with childbearing has been declining steadily since 1933, the first year in which data are available for the entire continental United States From 6 2 in 1933, the maternal mortality rate decreased 79 per cent to 1 3 in 1947 Maternal mortality decreased more rapidly among white than nonwhite women The maternal mortality rate for the white race decreased 80 per cent, from 5 6 in 1933 to 1 1 in 1947, and the rate for the nonwhite races decreased 66 per cent in this period, from 9 7 to 3 3

For the State of New York the number of maternal deaths in 1947 was 325, in 1946, 343, and in 1940, 576 The rate of maternal deaths per 1,000 live births for the years 1947, 1946, and 1940, respectively, were 1 0, 1 02, and 2 9

NOTE This marked improvement accomplished without any system of compulsory health insurance —*Editor*

American Academy of Pediatrics Publishes Report on Health Survey

RESULTS of a three-year study of child health services in the nation were announced recently by Dr Warren R Sisson, president of the American Academy of Pediatrics The report was compiled by the Academy with the cooperation of the U S Children's Bureau and the U S Public Health Service under the general direction of Dr John P Hubbard, Philadelphia child health specialist The survey covered every one of the nation's 3,076 counties and was begun in 1946

Deficiencies and inequalities in child care were pointed out in the report It was found that children in or near cities, almost one half of the nation's citizens under sixteen years of age, received 50 per cent more care than those in isolated or rural areas The report emphasized the need for more physicians who are well trained in the care of children and indicated that the present training of doctors in medical schools and hospitals is inadequate

The amount of medical care given the children of New York State is 60 per cent above the national average according to the report. However, it points out that the children in the nine counties comprising the greater metropolitan New York area receive 70 per cent more medical care than the children in the 53 upstate counties The Academy's findings in New York State were based on questionnaires sent out by Dr George M Wheatley, director of the New York State Study Committee of the American Academy of Pediatrics, and supplemented by data supplied by the New York State Medical and Dental Societies, the State Survey and Planning Commission for Hospitals, the Hospital Council of Greater New York, the State departments of health and education, local health departments and agencies

The report stressed the importance of improved medical training in child care for all physicians by having undergraduate and postgraduate education attend more to the preventive aspects of pediatrics and further emphasized that improved hospital facilities for child care in upstate areas would draw more well-trained physicians

Awards by Life Insurance Medical Research Fund

LIFE insurance companies of the United States and Canada will contribute $680,000 during the coming year for the support of heart disease research, it was announced last month by Mr Albert Linton, chairman of the *Life Insurance Medical Research Fund*. The awards raise to more than $2,500,000 the amount contributed by the companies since the Fund was started late in 1945

A total of $585,300 of the funds awarded will be used as grants-in-aid by a group of 35 universities and research centers in the United States and Canada for the support of some 53 different research projects being carried on by individuals or by groups of investigators All of this research is designed to provide basic information about the nature and causes of various forms of heart disease, some represents the continuation of work begun under the Fund's support in previous years

In addition to the money awarded as grants-in-aid, the Fund has also announced the allocation of $94,700 for the support of 18 graduate and nine undergraduate research fellows who will work in the field of heart disease under the supervision of experienced investigators in medical centers in this country, in Canada, and, in the case of one award, in Zurich, Switzerland.

Organized late in 1945, the Life Insurance Medical Research Fund is now supported by 147 life insurance companies in the United States and Canada and to date has distributed $2 575 000 for grants-in-aid and fellowships Because heart disease is at once the most common of all causes of death and has traditionally received less financial support for fundamental research, the Fund has so far restricted its activities to this field and particularly to research into such conditions as high blood pressure, hardening of the arteries, coronary disease, and rheumatic fever

The Fund is one of the pioneer organizations in its field and by the end of 1948 over 260 articles had been published in professional journals on the basis of work it had supported in full or in part

Among those receiving grants were the following

College of Physicians and Surgeons, Columbia University—Dr Erwin Chargaff, for research on the chemistry and physiology of thromboplastic liquids and their role in intravascular clotting, $12,600, Dr Robert F Loeb, for research on then eo-epinephrine and epinephrine content of adrenal medulla, ympathetic chains, and urines of normal and hypersensive subjects, $4,200, Dr Beatrice Carrier Segal, for research on biologic activities of streptococcus in relation to development of rheumatic fever and acute nephritis, $3,885

Mount Sinai Hospital—Dr Paul Klemperer, for research on the development and nature of connective tissue, $9,870

New York University-Bellevue Medical Center—Dr David P Earle, Jr , for research on the relation between renal function and the volume and composition of body fluids, $21,000, and Dr Colin M MacLeod, for research on streptococcal products and relation to development of rheumatic fever, $26,250

Syracuse University College of Medicine—Dr Jane Sands Robb, for research on the structure and functioning of the conducting system of the heart, $25,200, and Dr W W Westerfield and Dr J M McKibbin, for research on the effect of lipotropic substances on phospholipid and cholesterol distribution, $6,405

University of Rochester, School of Medicine and Dentistry—Dr Victor M Emmel, for research on the transition from the benign to the malignant phase of experimental hypertension, $8,925

MEDICALLY SPEAKING—

Radioisotope Unit Established at Northwestern University—The newest radioisotope unit in the middle West, and one which is uniquely constituted for the triple activities of instruction, research, and therapy, has just been established in the Medical School of Northwestern University

Equipment for the unit's laboratories is being financed with a grant in excess of $27,000 from the U S Atomic Energy Commission through the Office of Naval Research

In addition to providing instruments and other facilities for research involving the use of radioisotopes, the Medical School unit will introduce several new courses into its undergraduate curriculum and already has formulated a proposed program of postgraduate medical instruction in the utilization of radioactive elements

Book Plates—Physicians who have book plates should send copies to the Huntington Library, San Merino, California, where a collection of them is being made

National Cancer Foundation—The National Cancer Foundation, an organization devoted solely to services to advanced cancer patients, would like to make its program more widely known to members of the medical profession The work is with patients in the middle and low income groups who have had unusual expenses incidental to this long illness It does not include the indigent, as ample provision is made for them by city departments of welfare It is not possible to pay all the expenses in any case, but, rather, supplementary financial aid is given to help provide comfort and care for the patient Since every problem is different, treatment of each case varies according to its individual needs Cases are recommended to the social service department of this organization from many sources, but it is preferred that they be referred by physicians, visiting nurse associations, county medical societies, and social workers in hospitals or other community agencies However, applications from a responsible member of the patient's family are also considered Application forms may be obtained from the National Cancer Foundation, 101 Fifth Avenue, New York 3

American Academy of Neurology Established—The establishment of the American Academy of Neurology, whose purpose it is to further and encourage the practice of clinical neurology and to stimulate teaching and research in neurology and allied sciences, has been announced

Active membership in the Academy is open to every physician who has been certified in neurology or in both neurology and psychiatry Junior membership is available to physicians presently engaged in postgraduate studies in neurology or who are awaiting certification in neurology In addition, there is an associate membership for those who are not certified in neurology but whose interests are in fields related to neurology

The first scientific meeting will be held at the French Lick Springs Hotel, French Lick Springs, Indiana, on June 1, 2, and 3, 1949

Communications to the Academy should be addressed to Dr Joe R Brown, 19 Millard Hall, University of Minnesota, Minneapolis 14, Minnesota.

National Cancer Institute Grants—National Cancer Institute grants of $671,200 to finance laboratory and clinical research in cancer were announced recently by Oscar R. Ewing, Federal Security Administrator The grants were approved by Surgeon General Leonard A Scheele of the Public Health Service following recommendation by the National Advisory Cancer Council.

Among those receiving grants from the National Cancer Institute were the following

Dr William H Buschke, Manhattan Eye, Ear and Throat Hospital, study of intercellular cohesion in corneal epithelium, $5,940

Dr Joseph H Buchenal, Memorial Hospital, study of chemotherapy of experimental leukemia, $7,700

Dr Allen O Whipple, Memorial Hospital, study of experimental surgery, $7,100

Dr David A Karnofsky, Memorial Hospital, study of growth and effect of neoplastic tissue on chick embryo with particular reference to Hodgkin's disease, $9,700

Dr Emil J Baumann, Montefiore Hospital, study of factors governing selective filtration of ions by the thyroid, $7,340

Dr William S McCann, University of Rochester, study of metabolic studies on patients with neoplastic diseases, $15,066

Dr E Henry Keutman, University of Rochester School of Medicine and Dentistry, study of application of paper partition chemotography to steroid hormones in patients with cancer, $7,560

Dr Myron Gordon, New York Zoological Society, study of genetic and correlated studies of normal and atypical pigment cell growth, $19,899

Dr J J Biesele, Memorial Hospital, study of tissue culture studies of tumor growth and inhibition, $6,588

Dr Antonio Rottino, St Vincent's Hospital, study of Hodgkin's disease, $10,000

New Film on Cancer Released—A new film, titled "Cancer The Problem of Early Diagnosis," which has received the approval of the American Medical Association's Committee on Medical Motion Pictures, was made available to the medical profession recently through more than 50 state and regional distributing points by the American Cancer Society

Prints for single showings may be borrowed from state cancer society offices, state health departments, and the regional offices of Association Films located in New York City

The film, designed for general practitioners, is based on the premise that if cancer were diagnosed early and effectively treated the death rate might be reduced by almost 50 per cent

Dedication of Rochester University Psychiatric Clinic—The new $3,000,000 Psychiatric Clinic of the University of Rochester's School of Medicine and Dentistry was dedicated at ceremonies on March 21

The new institution, attached to the medical school's teaching hospital, is designed, in structure and function, to be an integral part of the general services of Strong Memorial Hospital and of the medical school rather than an isolated unit. Part of its program will be psychiatric training of medical students, physicians, career psychiatrists, clinical psychologists, nurses, and social workers

Its director is Dr John Romano, professor of psychiatry The clinic at present has accommodations for 34 in-patients, with an eventual capacity of 65 Outpatient work with both children and adults has been in progress for several months

Research Projects Announced by Atomic Energy Commission—Twenty-one new research projects in biology and medicine will be financed by the U S Atomic Energy Commission under contract with 16 universities and two hospitals With the new contracts a total of 78 research studies in biology and medicine are currently being financed by the Commission in addition to the work being done at the major laboratories of the national atomic energy program.

The use of radioactive materials for medical diagnosis, the measurement of radiation dosage from radioactive cobalt, and additional investigation of the effects of radiation upon plant and animal tissues are among the studies to be made under the new contracts.

Among those projects being financed are studies on the use of radioactive iodine in developing quantitative assay method for thyrotropic hormone by Dr S C Werner, Columbia University, and the measurement of tissue dose due to gamma and beta active radioisotopes by Dr R. Loevinger, Mount Sinai Hospital.

Sharp and Dohme, Inc., Expresses Opposition—Mr John S Zinsser, chairman of the Board of Sharpe and Dohme, Inc., in his annual report to the company declared his opposition to government health insurance. Among other things he stated,

"A variety of proposals are presently under discussion in medical circles, in the public press, and in the Congress, for the extension and improvement of medical care in this country All will agree with these objectives

"Since Sharp and Dohme is a part of the country's medical system and is greatly concerned with the health and vigor of that system, it is keenly interested in these proposals

'The management of this company strongly disapproves of Federal compulsory health insurance, believing that in the long run it would prove injurious to further medical progress and even to the maintenance of present medical standards.

"On the contrary, we believe that the objectives sought can be better attained and in a way more consistent with the free enterprise system by the extension of the present voluntary insurance plans and by the adoption of other measures such as those which have been suggested by the American Medical Association and others."

American Pioneer in Celiac Therapy Honored—Leading pediatricians and medical organizations of 19 countries throughout the world and the United States joined a large group of distinguished American laymen in paying tribute to seventy-nine-year-old Dr Sidney V Haas, pioneer in celiac therapy, at a golden jubilee luncheon given in his honor at the New York Academy of Medicine on April 5 In addition to honoring Dr Haas's original contributions to the field of pediatrics, the luncheon also marked his completion of fifty years of medical practice in New York City

On behalf of 160 physicians and medical associations in this country and abroad, Dr L. Emmett Holt, Jr , chief of children's medicine, Bellevue Hospital, presented Dr Haas with a Golden Book of Tributes containing letters praising his contributions to science of pediatrics, particularly in celiac therapy and the treatment of the hypertonic infant

Speakers at the luncheon included Robert Moses, Park Commissioner of New York City, and Dr Murray H. Bass, former chief of pediatrics, Mt Sinai Hospital.

Election of Fellows of the American College of Physicians—Announcement was made at the annual convocation of the American College of Physicians on March 30 in New York City of the election of 29 New York physicians to fellowship in the College To be eligible for fellowship, a physician must have been graduated from an approved medical school, serve three years as an associate in the College, and, if engaged in practice, his professional activity must be limited to internal medicine

Physicians from New York, thus honored were Drs Philip Goldstein, Julius Kavee, Samuel J Schneierson, Bronx, Drs Dana W Atchley, Seymour H. Rinzler, Adolph R. Berger, John E Deitrick, Walter Goldfarb, M Leonard Gottlieb, Henry Horn, Anthony M Kasich, Theodore E Oppel, Ralph F Schneider Martin D Smith, Leon N Sussman, Arthur M Tunick, Victor F Woolf, Manhattan, Drs Maxmillian Wachstein, Abraham M Kleinman, Samuel Spitz, Brooklyn, Dr William O Benenson, Flushing, Drs Leonard Horn and Frederic D Zeman, Rochester, Dr Paul A. Burgeson, Warsaw, Dr Orren D Chapman, Syracuse, Dr Samuel E Cohen, Elmira, Dr Elfred L Leech, Oneonta, Dr Robert A. Ullman, Buffalo and Dr Milton H Morris, Far Rockaway

Cancer Grants to Seven New York Institutions—Seven institutions in New York City will receive grants totaling $275,415 in support of cancer research, it was announced recently by the New York City Cancer Committee of the American Cancer Society The grants will provide for one year's

continuation of 27 promising projects already under way as well as the establishment of four new projects

Institutions receiving the grants are Columbia University, $118,816, Cornell University Medical College, $54,070, Sloan-Kettering Institute for Cancer Research, Memorial Hospital, $54,276, Mount Sinai Hospital, $12,908, New York Botanical Garden, $12,731, the Rockefeller Institute for Medical Research, $10,000, and New York University, $22,614.

Brigadier General John Reed Kilpatrick, chairman of the executive committee for the New York Cancer Committee's 1949 fund drive, scheduled to start April 4, said that the grants complete the allocation of funds available from public contributions to the 1948 campaign

MEETINGS

Past

Cornell University Medical College Alumni Association

On March 24, the fifty-first anniversary of the founding of Cornell University Medical College, 700 alumni of the College gathered for a full day's program which included addresses by outstanding alumni and visits to clinics and laboratories for demonstrations and discussions of the research projects now going on at the New York Hospital-Cornell Medical Center Speakers were as follows Dr S Bernard Wortis, 1927, professor of neurology and psychiatry, New York University College of Medicine, on "Medical Mission to Poland—1948", Dr Irving H. Page, 1926, director of research, Cleveland Clinic, on "The Nature of Arterial Hypertension," and Dr Thomas Hale Ham, 1931, Thorndike Memorial Laboratory, on "Diagnosis and Mechanism of Hemolytic Anemias" Presentation of the first annual award of the Cornell University Medical College Alumni Association was made to Dr William S McCann, 1915, professor of medicine at University of Rochester, School of Medicine and Dentistry, for his outstanding contribution to medicine Dr McCann also delivered the first annual lecture of the Alumni Association on the topic, "Some Neglected Aspects of Cardiology"

New York Council of Surgeons

"Recent Advances in the Care of the Newborn—Full-term and Premature" was the subject of a lecture by Dr Nathan M Greenstein, assistant clinical professor of pediatrics at New York Medical College, at a meeting of the New York Council of Surgeons on April 5

Four County Clinical Teaching Day

Under the sponsorship of the Genesee, Orleans, Livingston, and Wyoming County Medical Societies, a four-county Clinical Teaching Day was held on April 20 The scientific program included the following speakers Dr Frank C Combes, New York City, on "Common Skin Diseases", Dr Fred Kergin, Department of Surgery, University of Toronto, on "Lung Tumors", Dr Richard C A Jaenike, attending psychiatrist, Strong Memorial Hospital, on "Psychiatric Approach in General Practice", Dr George E Anderson New York City, on "Management of Diabetes," and Dr George T Pack, New York City, on "Gastric Cancer—The Responsibility of the General Practitioner and the Surgeon"

New York Polyclinic Medical School

A seminar in otolaryngology-ophthalmology was held by the New York Polyclinic Medical School and Hospital April 25 to 29, consisting of a review of recent advances in the diagnosis and treatment of common disorders in the fields of otolaryngology and ophthalmology with lectures, motion pictures, and demonstrations in the clinics, operating rooms, and dissecting room. Among the guest speakers were Dr August L. Beck, New Rochelle Hospital, Drs Conrad Berens, Loren P Guy, Willis S Knighton, Byron C Smith, and Alfred Weintraub, New York Eye and Ear Infirmary, Drs John M Converse, Edmund Prince Fowler, W Guernsey Frey, and David H Webster, Manhattan Eye, Ear and Throat Hospital, Dr Westley M. Hunt, St. Luke's Hospital, Dr Alfred Kestenbaum, Bellevue Hospital, and Dr John M Loré, St. Vincent's Hospital

Future

Orthopedic Alumni of Hospital for Joint Diseases

"The Results of Treatment of Bone Sarcoma," the annual Sir Robert Jones lecture to be delivered on May 12 at 8 30 P M by Dr C Howard Hatcher, associate professor of orthopedic surgery of the University of Chicago, will be the highlight of the three-day orthopedic alumni conference to be held at the Hospital for Joint Diseases from May 12 to 14 Morning and afternoon sessions of the conference will deal with advances in surgery and allied subjects with the presentation of papers and a scientific exhibit of orthopedic material

A dinner-dance will be held on May 14 in the Sert Room of the Waldorf-Astoria For further information call Dr J J Golub at Lehigh 4-5500, extension 211

Annual Chest Conference of St John s Episcopal Hospital

The fourth annual chest conference of St John's Episcopal Hospital will be held at the Hospital on May 21 Dr E K Johnson will discuss "Pre- and Postoperative Management of Thoracic Surgery Cases," and Dr Richard Sweet will speak on "Cancer of the Esophagus"

International Congress on Rheumatic Diseases

The seventh International Congress on Rheumatic Diseases conducted by the American Rheumatism Association under the auspices of the International League Against Rheumatism will be held from May 30 through June 3 at the Hotel Waldorf-Astoria The Congress will be devoted to the subject of rheumatic disease in all its phases, to-

gether with certain allied topics, and the program includes presentations of papers, clinics, and round-table discussions.

New York Academy of Medicine

A clinical research meeting will be held by the New York Academy of Medicine on June 1 The meeting, arranged by the Committee on Medical Education of the Academy, will comprise presentations of original work in clinical medicine

American Academy of Dental Medicine

The American Academy of Dental Medicine will hold its annual meeting on June 4 and 5 at the Statler Hotel, New York City Included in the program will be a symposium on psychosomatics and round-table discussions on this subject. For further information address Dr William M Greenhut, National Secretary, 124 East 84th Street, New York 28

PERSONALITIES

Honored

In memory of the late Dr Nathan B Bluestone, the Yorktown Community Nursery School has completed plans for a memorial to be known as the "Dr Nathan B Bluestone Memorial Youth Center" Dr John Frederick Erdmann, in celebration of his eighty-fifth birthday on March 27, a party given by operating room nurses at New York Post-Graduate Hospital Dr Elihu Katz, president of the Society for the Establishment of a Medical College at Yeshiva University, at a testimonial dinner March 20 for his work in the campaign to build the school.

Awarded

For outstanding achievment in preventive medicine, Dr Stanhope Bayne-Jones, president of the joint administrative board of the New York Hospital-Cornell Medical Center, the James D Bruce Memorial Medal at the annual convocation of the American College of Physicians on March 28

Appointed

Dr Theodore J Curphey, chief medical examiner of Nassau County, as chairman of the Council Committee on Public Health and Education of the Medical Society of the State of New York Dr Milton Feig, of New York and Great Neck, as district health officer for the State Board of Health in Wisconsin with headquarters in the city of Green Bay Dr C P Rhoads, as medical director of the Memorial Hospital Center for Cancer and Allied Diseases Dr Elias Rubin, Jamaica, Long Island, as chairman of the Queens Physicians Division of the United Jewish Appeal for the 1949 campaign.

Elected

Dr Thomas N Sheen, to the board of directors of the New York Tuberculosis and Health Association, and Dr Edward P Eglee, chairman of the executive committee of the organization.

Speakers

Dr Harold Peck, psychiatrist at the Children's Court treatment clinic, at a seminar on delinquency sponsored by two committees of the Welfare Council on March 14 At a meeting of the South Glens Falls Rotary Club on March 15, Dr E Yale Clarke, of Glens Falls Dr Martin Steinberg, superintendent of Mount Sinai Hospital, Dr Ralph Kaufman, psychiatrist, and Dr Samuel R. Lehrman, chief of the Psychiatric Clinic at Mount Sinai, at a seminar on psychosomatic medicine for the Chaplaincy Institute of the New York Board of Rabbis on March 16 At the fortieth anniversary conference of the National Society for the Prevention of Blindness on March 16, Dr Hunter H Romaine, consultant ophthalmologist at the New York University Reading Clinic Dr John B Pastore, executive director of the Hospital Council of Greater New York, at the graduation of student nurses at New York Medical College, Flower and Fifth Avenue Hospitals on March 18 Dr Ernest P Boas, Mount Sinai Hospital, Dr Dean A. Clark, medical director of the Health Insurance Plan of Greater New York, and Dr George T Pack, Memorial Hospital, at a forum dinner meeting on compulsory health insurance at the New School for Social Research on March 24 Dr Louis H Bauer, vice-chairman of the Board of Trustees of the American Medical Association, at the annual meeting of the Council of Affiliate Agencies of the Federation of Protestant Welfare Agencies, March 30, on the topic "The National Health Plan" On March 30, at a meeting of the New York Association of Occupational Therapists, Dr Eugene L Swan, senior psychiatrist at Rockland State Hospital Dr John C A Gerster, chairman of the New York City Cancer Committee, at the second annual dinner of the Pearl Harrow Cancer Memorial on April 2 As the 1949 Biggs Lecture at the New York Academy of Medicine on April 6, Dr Howard A. Rusk, professor of rehabilitation and medicine at the New York University College of Medicine, on "The Medical, Social, and Public Health Aspects of Rehabilitation" Dr Hart E. Van Riper, medical director of the National Foundation for Infantile Paralysis, Inc , and Dr Daniel S Cunning, on "The Tonsillectomy-Poliomyelitis Problem" at a session of the fifty-third annual meeting of the American Laryngological, Rhinological, and Otological Society, Inc , on April 18 At a conference on April 22 sponsored by the Child Research Clinic of the Woods Schools of Langhorne, Pennsylvania, Dr Richard L Frank, professor of psychiatry, Long Island College of Medicine on "The Parents "

New Offices

Dr Benjamin L. Harrison and Dr Maxwell Harrison, in Newburgh, for diseases of the eye ear nose, and throat.

COUNTY NEWS

Erie County

Dr Joseph Burchenal of Memorial Hospital, New York, spoke on "Clinical Approach to Chemotherapy of Cancer" and Dr Gray H. Twombley, also of Memorial Hospital, spoke on "The Diagnosis and Treatment of Carcinoma of the Cervix" at the afternoon Clinical Session of the Cancer Teaching Day

presented by the Erie County Medical Society on April 26 At the evening session, the stated meeting of the County Medical Society, Dr Cushman D Haagensen, director of the Institute of Cancer Research at Columbia-Presbyterian Medical Center, addressed the members Dr Haagensen's topic was "Diagnosis and Treatment of Carcinoma of the Breast"

The second annual public education meeting of the Erie County Chapter of the American Cancer Society was held on April 5 Speakers included Dr Louis Dublin, vice-president and chief statistician of the Metroplitan Life Insurance Company, New York City, on "Progress in Cancer Control," and Dr Louis C Kress, director of the Roswell Park Memorial Institute, on "Progress in Research, Diagnosis, and Treatment of Cancer"

Genesee County

The Genesee County Medical Society with the cooperation of Genesee Memorial and St Jerome's Hospitals has inaugurated the Genesee County Medical Society Blood Donor Registration, a service which has as its aim the recording of the blood types of as many persons in the county as possible so that donors will be available through the hospital files for the needs of rare blood types or to meet the demands of an unexpected emergency

Kings County

As of March 17, 1949, the Brooklyn Psychiatric Society was officially established and functioning The inaugural meeting was held on April 21 at which time the president, Dr Simon Rothenberg, delivered his inaugural address Other officers include Dr Sam Parker, vice-president, and Dr Morton Hand, secretary-treasurer

Nassau County

The regular monthly meeting of the Medical Society of the County of Nassau was held on March 29 Col William L Wilson, M C , special assistant to the Surgeon-General, U S Army, and chief surgeon of the Truman Plan for Greece and Turkey, gave a talk on the topic, "Atomic Energy and Its Relation to Medicine"

Dr J William Hinton, attending surgeon at Bellevue and New York Post-Graduate Hospitals, was the guest speaker at a meeting of the Long Island Surgical Society of the International College of Surgeons on April 12 Dr Hinton spoke on "The Present Status of Gastric Surgery with a Discussion of the Contraindications of Vagotomy"

Onondaga County

On March 17 the annual dinner meeting of the Onondaga Health Association was held with Dr Henry Van Zile Hyde as guest speaker Dr Hyde, medical director of the U S Public Health Service and United States representative on the executive board of the World Health Organization, spoke on the World Health Organization and its meetings in Geneva, Switzerland

Queens County

Members of the Queens County Medical Society heard Dr Nolan D C Lewis, director of the New York State Psychiatric Institute and professor of psychiatry at the College of Physicians and Surgeons, Columbia University, talk on the subject, "Psychosomatic Problems of Interest to the General Practitioner," at the stated meeting of the Society on March 29

Recent Friday afternoon lectures sponsored by the Medical Society included the following

April 18—Dr Jerome Schwartz, superintendent of psychiatry at Creedmore State Hospital, on "Alcohol and Other Forms of Drug Addiction"

April 15—Dr Lloyd F Craver, chief of medical service at Memorial Hospital, on "Some Aspects of Malignant Lymphomata"

"Treatment of Hypertension" was the topic of a lecture given by Dr William Goldring, associate professor of medicine, New York University College of Medicine, at the April 5 meeting of the Queens County Chapter of the American Academy of General Practice

Rockland County

Dr Sidney Schwartz, cardiac consultant to Good Samaritan Hospital, Suffern, and chief cardiologist at Montefiore Hospital, addressed the members of the Rockland County Medical Society at a meeting on March 2 Dr Schwartz spoke on the emergency treatment of acute heart attacks

At the business meeting Dr George M Richards, chairman of the doctors committee on "Aid to Echternach," and Dr John C Dingman, committee member, described plans for the collection of old and unused instruments from all Rockland County physicians and local hospitals Echternach is a town in the Grand Duchy of Luxembourg which was badly battered during the Battle of the Bulge in World War II According to reports, the hospital building, which had been completely destroyed, was now rebuilt, but there were no modern instruments available

Schenectady County

A special meeting of the Schenectady County Medical Society was held on April 7 Dr Chester S Keefer, professor of medicine at the Boston University School of Medicine and physician-in-chief of the Massachusetts Memorial Hospital, spoke on "The Choice of Chemotherapeutic Agents in the Treatment of Infections with Special Reference to Eye, Ear, Nose, and Throat Diseases"

Sixty members of the County Medical Society were guests of Winthrop-Stearns, Inc , on March 17 at an open house designed to acquaint physicians with the latest developments in the drug industry The program included a tour of the Winthrop-Stearns, Inc , plant, dinner, and a scientific seminar Dr A M Lands, in charge of pharmacodynamics research at the Winthrop-Stearns Research Institute spoke on "Insuprel and Other New Drugs in the Treatment of Asthma," and Dr Charles F Kade, Jr , in charge of nutritional research at the Institute, spoke on "Protein Hydrolysates" In addition, Dr A E Sherndal, vice-president in charge of manufacturing, explained the problems of transferring a new product from the laboratory to commercial manufacture

Ulster County

"Keeping Your Baby Well" is the title of a series of radio transcriptions which will be featured on the Ulster County Health Department's regular weekly broadcast over Station WKNY The series is distributed by the American Medical Association in cooperation with Ulster County Medical Society

WOMAN'S AUXILIARY

TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Auxiliaries Adopt Resolutions Opposing Health Insurance

MEMBERS of county auxiliaries, component units of the Woman's Auxiliary to the Medical Society of the State of New York, have adopted resolutions opposing compulsory health insurance and are to be congratulated for their cooperation in this important work, the Public Relations Bureau of the Medical Society of the State of New York has announced.

Resolutions have already been received by the Public Relations Bureau from the following county auxiliaries Allegany, Chautauqua, Oneida, Richmond, and Rensselaer Other auxiliaries, which have passed similar resolutions, have not yet filed copies with the Public Relations Bureau.

If the passage of these resolutions is to accomplish its purpose, the Bureau suggests that each Auxiliary carry out immediately the following procedure

1 Retain the original resolutions in its files

2 Send a copy, with a personal letter, to the two United States Senators, the Representatives, and state legislators from its own district

3 Send a copy to the Public Relations Bureau, Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York, the American Medical Association office at 1302 18th Street, Washington, D C, and the National Education Campaign of the American Medical Association, 1 North LaSalle Street, Chicago 2, Illinois

4 Send a copy to each of the local newspapers and radio stations in its own district

COUNTY NEWS

Chautauqua County

Mrs Harold M Childress was elected president of the Chautauqua County Auxiliary, succeeding Mrs Calvin Clark Torrance, at the March meeting of the group held in Jamestown.

Other officers chosen include Mrs Hilding J Nelson, vice-president, Mrs Lucius H Bugbee, Jr, corresponding secretary, Mrs Harold A. Blaisdell, recording secretary, and Mrs Robert Storms, treasurer

Annual reports were given of the past year's activities, and Mrs Torrance reported that there was $290 in the nurse scholarship fund.

Nassau County

Dr Theodore J Curphey, Garden City, spoke on "Pertinent Facts About Legislation" at the meeting of the Nassau County Auxiliary held March 22 in Garden City Miss Marion Fegley of the Nassau County Tuberculosis and Public Health Association spoke on rheumatic heart disease

Following the Auxiliary meeting, the members joined with the Nassau County Medical Society to hear Colonel William L Wilson, special assistant to the Surgeon General of the United States Army, speak on "Atomic Energy and Its Relation to Medicine."

Queens County

The sixteenth anniversary of the Queens County Auxiliary was celebrated on March 22 at a tea and reception for new members. Mrs S A. Alexrod and Mrs Samuel Klein were in charge of refreshments

On April 26, the regular meeting was held, with the guest speaker being Mrs R J Knox, an interior decorator, whose topic was "Personality in Home Decoration."

Schenectady County

The Schenectady County Auxiliary met on March 22 at the Mohawk Golf Club for its regular monthly session, with Mrs Gomer Richards presiding

A playreading, "The Heiress," directed by Mrs Morris Shapiro, was presented, with the following cast Mrs Beverly Vosburgh, Mrs John Lord, Mrs Donald Binder, Mrs James Blake, Mrs Herman Galster, Mrs Michael Donovan, and Mrs Kencil Mitton.

Delegates to the State convention were elected and include Mrs Milton Gipstein, chairman, Mrs Raymond Byron, Mrs Michael Slovak, Mrs Kencil Mitton, Mrs Peter Sykowski, and Mrs William Jameson

Seneca County

Mrs Hyman Abrahamer was elected president of the Seneca County Auxiliary at the meeting held March 15 in Seneca Falls Other officers chosen are Mrs Arthur Baldwin, vice-president, Mrs. Roy Wallace, secretary, and Mrs Saul Towers, treasurer

A panel discussion was held on "Socialized Medicine" with members of the Auxiliary participating

Westchester County

A membership tea was held by members of the Westchester County Auxiliary on March 1 in New Rochelle Mrs N J DeJulio and Mrs Howard Kopins are cochairmen of the membership committee

BOOKS

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue Brooklyn N Y Acknowledgment of receipt will be made in these columns and deemed sufficient notification Selection for review will be based on merit and interest to our readers

now you can obtain **both**

a RAPID peak concentration of serum penicillin

and

a SUSTAINED therapeutic concentration

with a single injection from a single container

FLO-CILLIN "96"—the *original* 96-hour repository penicillin formulation—is now available with a *plus* Soluble Penicillin G Potassium—100,000 units per cc —has been added to the FLO-CILLIN "96" formula. The soluble potassium penicillin is absorbed promptly, with a resulting initial penicillin blood concentration sufficient to overwhelm invading bacteria at the outset. The insoluble Procaine Penicillin G, with water-repellent aluminum stearate in oil, is absorbed slowly and regularly over a period measured in days Thus, with a single injection from a single container, it is now possible to obtain an initial *peak* penicillin blood level, together with a *therapeutic* blood level which is sustained for 96 hours in approximately 90 per cent of patients *

CONSTANTLY FLUID

REQUIRES NO PROLONGED SHAKING

WILL NOT SETTLE OUT

REVIEWED

Diseases of Children's Eyes. By James Hamilton Doggart, M D Octavo of 288 pages, illustrated St Louis, C V Mosby Co , 1947 Cloth, $10

This is a very practical introduction to the ophthalmology of childhood and to ophthalmology in general It is well printed, very well illustrated, and a credit to the author and publisher We commend it to the beginner who, if interested in children's eyes, will find he has made a broad approach and cannot help but continue the study to a higher level

RALPH I LLOYD

Treatment in General Practice By Harry Beckman, M D Sixth edition Octavo of 1,129 pages, illustrated Philadelphia, W B Saunders Co , 1948 Cloth, $11 50

The sixth edition of this popular treatise on therapy has been brought up to date in a highly satisfactory manner As usual, the latest edition of *Beckman* can be recommended to all the general practitioners for whom it is intended The value of the volume would be enhanced if there were a separate chapter on the use of the antibiotics The general principles are, after all, the same, no matter in which condition they are used The brief section starting on page 977 is too sketchy and treats only of toxic reactions

MILTON PLOTZ

Experimental Air-Borne Infection. By Theodor Rosebury With the coauthorship and assistance of the staff of the Laboratories of Camp Detrick, Maryland Octavo of 222 pages, illustrated Baltimore, Williams & Wilkins Co , 1947 Cloth, $4 00 (Microbiological Monographs Official Publication of the Society of American Bacteriologists)

One portion of this interesting book is devoted to the description of the cloud chamber building, the technics employed in producing clouds of labile agents, and a discussion of the distinctive features of the several varieties of atomizers employed The section dealing with the stability and infectivity of bacteria and viruses is full of imposing data. However, the material is presented in a manner so formidable that only those who are interested particularly in experimental air-borne infection will take the time to profit from a study of this important monograph

MORRIS L RAKIETIN

Minor Surgery By Frederick Christopher, M D Sixth edition Octavo of 1,058 pages, illustrated Philadelphia, W B Saunders Co , 1948 Cloth, $12

The sixth edition is revised and special sections have been added regarding antibiotics and experiences arising out of World War II Some of the sections have been revised and amplified The surgical principles are sound and noncontroversial The recommendations are direct and comprehensive and the illustrations are descriptive It is an excellent ready reference book on minor surgery and some phases of major surgical problems The book should be of inestimable value, not only for the general practitioner and the "surgical intern," but will be found worth reading by qualified surgeons

IRWIN E SIRIS

Operative Gynecology By Harry Sturgeon Crossen, M D , and Robert James Crossen, M D Sixth edition Quarto of 999 pages, illustrated St Louis, C V Mosby Co , 1948 Cloth, $15

This book has been well received for more than thirty years It is truly packed with illustrations and information Much space is devoted to the familiar Crossen technic, and the authors' interest in foreign bodies in the abdominal cavity has not abated a bit Many of the old operations for retroversion, which were never any good anyway, are described, and a chronologic table of that better for-

[Continued on page 1098]

"Imprisoned in every fat man,
a thin one
is wildly signaling to be let out."

C C Palinurus, quoted in Bull New York Acad Med 24 2 (Feb) 1948.

Overeating imprisons the "thin one", and he can signal till doomsday, but he will never get out unless the "fat man" stops overeating.

'Dexedrine' Sulfate curbs appetite, makes it easy for the overweight patient to stop overeating and thus reduces weight safely without the use (and risk) of such potentially dangerous drugs as thyroid.

Dexedrine Sulfate Tablets & Elixir

The most effective drug for control of appetite in weight reduction

'Dexedrine T M Reg U S Pat. Off for dextro amphetamine sulfate, S K F

[Continued from page 1096]

gotten era is included The chapter on pelvic inflammatory disease and parametrial cellulitis is excellent evidence that the authors know more about these subjects than many others who have written textbooks on gynecology CHARLES A GORDON

Dermatologic Therapy in General Practice By Marion B Sulzberger, M D, and Jack Wolf, M D Third edition Large duodecimo of 663 pages, illustrated Chicago, Year Book Publishers, 1948 Cloth, $7 75

In the last war, the earlier edition of this book, with its explicit directions concerning diagnosis, treatment, and the proper methods for its application, proved of enormous value to those members of the profession who found themselves in one of the services of our country

The authors of this volume are able to speak with the authoritative knowledge which long practice in teaching and experience has granted them The illustrations which accompany the text are excellent and definitive, but, today, with color printing at its highest perfection, the absence of color plates for diagnostic assistance is much to be regretted

NATHAN THOMAS BEERS

The Epithelia of Woman's Reproductive Organs. A Correlative Study of Cyclic Changes. By George N Papanicolaou, M D, Herbert F Traut, M D, and Andrew A Marchetti, M D Quarto of 96 pages, illustrated New York, Commonwealth Fund, 1948 Cloth, $10

The book is a monograph on the various epithelial structures in the female genital tract It correlates cytologic changes occurring in the epithelia of the vagina, cervix, uterus, and tubes Physiologic and embryologic relationships are included It is based on a ten-year study of material obtained from 233 patients

The authors are pioneers in the development of the vaginal smear technic A comprehensive bibliography and 23 beautifully colored plates accompany the text ALEXANDER H ROSENTHAL

Oxford Loose-Leaf Medicine, Supplements. 16 reprints Octavo New York, Oxford University Press, 1947 Available only to subscribers

This is a collection of monographs on subjects within the field of internal medicine replacing obsolete sections in the Oxford Loose-Leaf Medicine In general, they are excellent essays fully worthy of inclusion in this well-known system The chapters devoted to edema and multiple myeloma, good as far as they go, are too sketchy Those on arterial hypertension by Ayman and on kidney disease by Christian retain their usual standard of excellence

MILTON PLOTZ

Occupational Medicine and Industrial Hygiene By Rutherford T Johnstone, M D Octavo of 604 pages, illustrated. St Louis, C V Mosby Co, 1948 Cloth, $10

This book covers the various types of potential industrial illnesses caused by the noxious materials released during manufacturing processes in which chemicals and metals are involved It furnishes details of symptomatology, pathology, and treatment of these types of illnesses with complete case history reports of an interesting nature

Graphically illustrated, it contains many interesting charts of tests to determine toxic agents The Workmen's Compensation Provisions and the State regulation and classification of occupational diseases are well worked out J J WITTMER

The Medical Clinics of North America. Chicago Number January, 1948 Octavo Philadelphia, W B Saunders Company, 1948 Published Bi Monthly (six numbers a year) Cloth, $16 net, paper, $12 net

This is another useful collection of clinical reviews, chiefly on endocrinology Radioactive iodine, hypogonadism, endocrine management of breast and prostate malignancies are a few of the more important chapters There is one very good summary of precordial leads in electrocardiography by Katz which is worth careful study

The volume again is warmly recommended

ANDREW BABEY

Dermatology for Nurses By G H Percival, M D, and Elizabeth Toddie, S R N Octavo of 116 pages, illustrated Baltimore, Williams & Wilkins Co, 1947 Cloth, $4 50

This book should have a place in the library of every training school for nurses Its illustrations in both monochrome and color are superb, and the instructions for nurses in the handling of skin cases are intensely informative and valuable, having been written by a nurse of vast experience Dr Percival gives the salient features of most of the ordinary skin diseases, with instructions as to their diagnosis and treatment He still clings to gentian-violet in the infective lesions and mentions penicillin in one or two lines NATHAN THOMAS BEERS

Private Enterprise or Government in Medicine By Louis Hopewell Bauer, M D Octavo of 201 pages Springfield, Illinois, Charles C Thomas, 1948 Cloth, $5 00

No better protagonist for private enterprise in medicine could have produced a more complete exposition of the problems involved than the author His well-documented thesis makes it "must" reading for all who are interested in the future of the practice of medicine as it would affect both the physician as the donor and the public as recipient of the best medical care BENJAMIN M BERNSTEIN

Brief Psychotherapy A Handbook for Physicians on the Clinical Aspects of Neuroses. By Bertrand S Frohman, M D With the collaboration of Evelyn P Frohman Large duodecimo of 265 pages Philadelphia, Lea & Febiger, 1948 Cloth, $4.00

Brief Psychotherapy is a simple evaluation of every-day psychology in clinical medicine as applied by the good old family doctor The author in clear language tells the family physician how to organize his daily application of psychology into a scientific pattern called psychotherapy

The reviewer recommends this book.

MORRIS ANT

Headache and Other Head Pain. By Harold G Wolff, M D Octavo of 642 pages, illustrated New York, Oxford University Press, 1948 Cloth, $12

Wolff explores each type of headache from the aspects of experimental physiology, pathology, diagnosis, and treatment, with particular emphasis on psychotherapy There is an especially detailed study of migraine, emphasizing the mechanism whereby emotions are translated into functional and even anatomic changes

Migraine, histamine headache, hypertension headache, subarachnoid hemorrhage, and the neuralgias are only a few of the conditions analyzed in such detail that the physiology points clearly to diagnosis and treatment

This book can be highly recommended to any one interested in the subject of headaches

MORTON HUREWITZ

White House Physician By Vice-Admiral Ross T McIntire, Surgeon General of the Navy, in collaboration with George Creel Octavo of 244 pages New York, G P Putnam's Sons, 1946 Cloth, $3 00

When a doctor sees a patient daily for twelve years, and sees him always with the professional eye, his estimate of that patient's health is based on sounder data than the judgment of those whose opinion is determined by viewing a photograph And yet it cannot be denied that the appearance of the late president before his last sojourn to Warm Springs created a feeling of deep apprehension

What a responsibilty for a doctor to bear for so many years! Oft times was Dr McIntire faced with the problem of whether the patient or the welfare of the world were the more important Generally the decision was made by the patient And in that decision was revealed the wonderful character of the man

But Nature will not be denied Burdened physically by the tragedy of polio, and mentally by continued overwhelming responsibilities, his tissues had to succumb to the inevitable effects of wear and tear And, happening when it did, it became one of the great tragedies of history

One reads this book with a feeling of increased reverence for the chief character and a high degree of admiration for the physician S R BLATTEIS

An Integrated Practice of Medicine A Complete General Practice of Medicine from Differential Diagnosis by Presenting Symptoms to Specific Management of the Patient. By Harold Thomas Hyman, M D In Four Volumes and Index Octavo of 4,336 pages, illustrated Philadelphia, W B Saunders Company, 1946 Cloth, $50 set

Dr Hyman's *Practice of Medicine* is easily the best set of its kind available today In these volumes is contained a systematic discussion of all the problems likely to be encountered As might be expected from this gifted teacher, the relations of the basic sciences to clinical practice are lucidly explained, and as might be expected from an experienced practitioner, bedside management of the patient is expertly covered A feature of this "system" is a thorough discussion of the minor specialties so that the set may be considered an encyclopedia of medical knowledge It would be difficult to think of a more welcome addition to any doctor's library

MILTON PLOTZ

The Shame of the States By Albert Deutsch Octavo of 188 pages, illustrated New York, Harcourt, Brace & Co , 1948 Cloth, $3 00

Albert Deutsch is a writer, author, and a recorder of social conditions In 1946 and 1947 he visited about forty mental hospitals in different states, usually accompanied by a photographer He amassed a huge amount of documentary material dealing with the various psychiatric hospitals Some of these articles were published in *PM* but most of them were published in the book under review

The picture that he portrays is a most sordid one that should prick the public conscience and arouse the interest of state officials and public-spirited citizens to improve them He found conditions in public hospitals most shocking and horrible. The majority of them were ill-equipped, understaffed, and overcrowded, the food poorly prepared and inadequate He found hundreds of naked men and women herded in filth-infested wards, many of whom were in a semistarved condition, hundreds of sick people were shackled and bound to their beds And he discovered indisputable evidence of deaths caused by criminal negligence and manhandling There are many photographs of these revolting conditions

In the book he exonerates the physicians attached to these institutions and points out the handicaps under which they work, the poor pay, and the lack of facilities for improving their professional standards Moreover, he emphasizes the utter helplessness of members of the family of the mentally sick because of fear, shame, and confusion It is to the public at large that he directs this book so that adequate and proper methods should be used in improving the care of the mentally sick in our state hospital system It is a sad commentary that the author, who is an exponent of socialized medicine, should have found such conditions existing in our system, which is a pure form of state medicine This book should be read by all physicians and by all other intelligent people IRVING J SANDS

The Medical Clinics of North America. Nationwide Number March, 1948 Octavo Philadelphia, W B Saunders Company, 1948 *Published Bi-Monthly (six numbers a year)* Cloth, $16 00 net, Paper, $12 net

Another very practical and sensible set of discussions is added to the popular series of *Medical Clinics* A stiff tempering is applied to the early enthusiasm for vagotomy Arguments both for and against surgical treatment of silent cholelithiasis are a timely presentation in the current controversy over cancer of the gallbladder The Toronto group offers an excellent set of *clinics in biliary tract disorders* MAURICE TULIN

Mental Health in Modern Society By Thomas A C Rennie, M D , and Luther E Woodward, Ph D Octavo of 424 pages New York, Commonwealth Fund, 1948 Cloth, $4 00

This happy combination of authorship by a practicing psychiatrist and professionally trained social worker with ministerial background brings to the front for professional and lay reading a timely analysis of mental hygiene problems and their prevention and treatment which have grown out of the war and postwar periods

The volume, written in nontechnical language, is illustrated with case examples and pertinent diagrams All those interested in mental hygiene must consider this a fundamental book to be kept within easy reach FREDERICK L PATRY

MISSING—SEVEN CLAUSES

Our 21 years of specialized estate and insurance planning for professional men shows that using the hidden values and securing the missing clauses prevents losses and increases policy benefits 10% to 40% without changing policies or increasing the cost. Write or phone for an appointment at your office or ours and we shall be glad to show you how these clauses will increase the value of your policies. This is a public relations service to the medical profession without obligation.

when the diagnosis is seborrheic dermatitis...

Remember that **Pragmatar**— the outstanding tar sulfur salicylic acid ointment— is now recognized as one of the most effective preparations available for the treatment of seborrheic dermatitis, and particularly for the general care and hygiene of the seborrheic scalp

Pragmatar is also extremely useful in fungous infections, eczematous eruptions, psoriasis and pityriasis rosea

Pragmatar

Highly effective in an unusually wide range of common skin disorders

FORMULA cetyl alcohol coal tar distillate, 4%, near colloidal sulfur, 3%, salicylic acid, 3%— incorporated in a special washable base
Available in 1½ oz jars

Smith, Kline & French Laboratories, Philadelphia

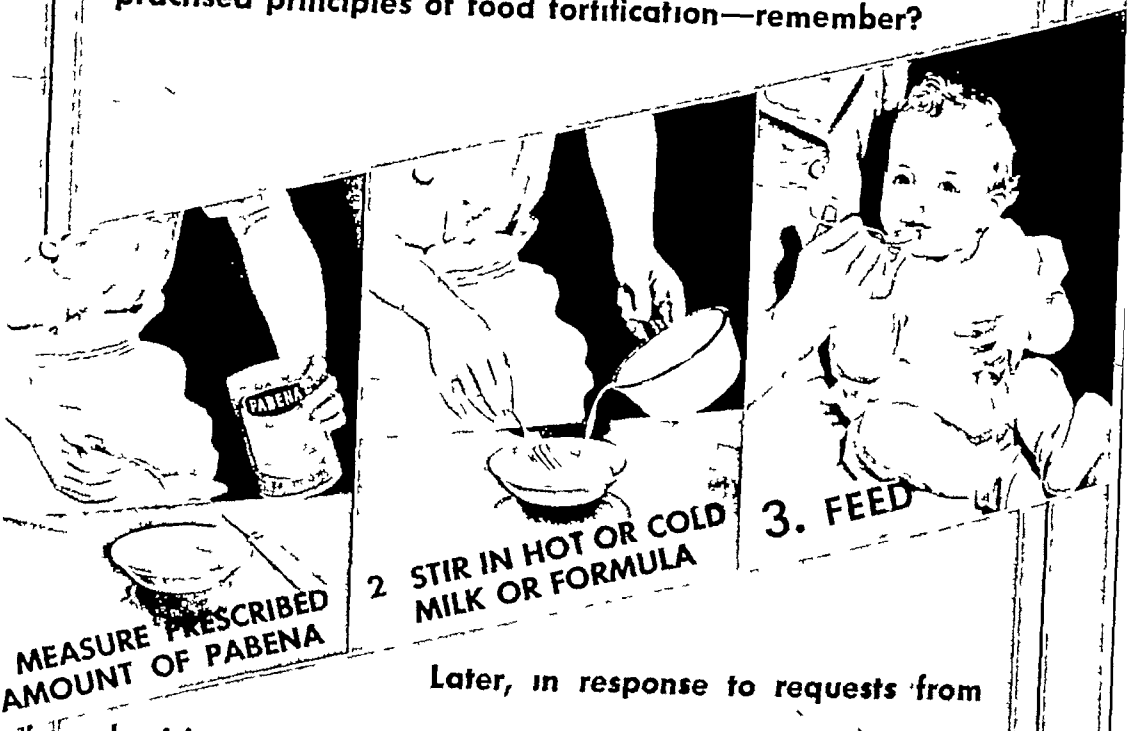
natural preference

A revealing test[1] recently was conducted on a group of cardiac patients in congestive failure, treated with intramuscular injections of different mercurial diuretics, the identities of which were unknown at the time to both patients and observers. The results showed that the majority clearly evinced a decided—and natural—preference for a diuretic agent that caused the least pain and discomfort—

MERCUHYDRIN®

Similarly, Gold *et al*[2] prefer MERCUHYDRIN in their routine treatment of the failing heart because "it is less irritant to the muscle and is less apt to produce pain"

MERCUHYDRIN is also preferred by the treating physician because of its dependability It is well tolerated systemically,[3,4] excellent water and salt diuresis is obtained,[1,4,6] and the diuretic response by intramuscular injection is the same as by intravenous injection.[1,4] With a systematic schedule of early and frequent administration producing controlled diuresis, MERCUHYDRIN aids greatly in prolonging the life, decreasing the invalidism and adding to the comfort of the cardiac patient. Symptoms of failure, such as peripheral edema, paroxysmal dyspnea or acute pulmonary edema, are prevented or minimized, and the distressing consequences of intermittent massive diuresis are obviated.



DOSAGE: MERCUHYDRIN 1 cc or 2 cc. intramuscularly or intravenously injected daily or as indicated until a weight plateau is attained. Subsequently the interval between injections is prolonged to determine the maximum period permitted to intervene between maintenance injections

PACKAGING: MERCUHYDRIN (mersalluride sodium solution) is available in 1 cc. and 2 cc. ampuls.

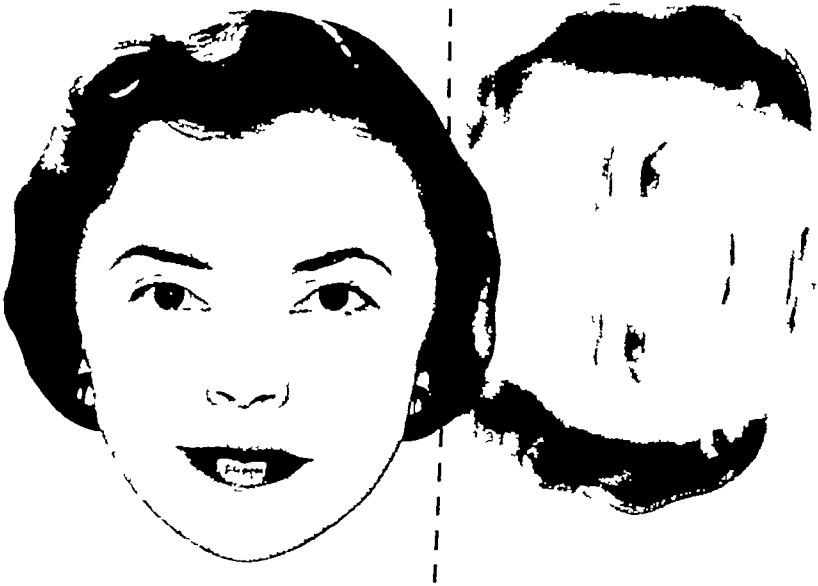
Announcement

NATIONAL POSTURE WEEK

will be observed this year

OCTOBER 17 — 22

We make this announcement so early in the year because many hundreds of physicians, surgeons, industrial physicians, health officers and other members of the profession have over the last ten years scheduled the event for May



The change to October has been made in deference to requests from schools, colleges, adult education groups and community welfare organizations like the "Y's" They now look forward to wider and more effective participation because they can key the event into their health education and physical fitness programs early in the school term, thus avoiding vacation season interruptions

As National Posture Week enters upon its second decade, it is our privilege to thank the many, many physicians who have given it their approval as a worthy contribution to public health education We pledge ourselves to carry on in the future as we have in the last ten years with National Posture Week and the daily work of The Samuel Higby Camp Institute for Better Posture We shall do this to the limit of our resources in accordance with the ethical precepts of the profession.

S H CAMP and COMPANY • JACKSON, MICHIGAN
World's Largest Manufacturers of Scientific Supports
Offices in New York • Chicago Windsor Ontario • London, England

Note: *Physicians may at any time ask for good posture booklets for distribution to their patients and for posters suitable for office and instruction display All are authentic Details and descriptions on request to—*

THE SAMUEL HIGBY CAMP INSTITUTE FOR BETTER POSTURE
Empire State Building New York 1 N Y (Founded by S. H Camp & Company, Jackson Mich.)

AT LAST! EFFECTIVE RELIEF IN BRONCHIAL ASTHMA

——"*inconspicuous side effects*" [1]

Prompt, complete relief in bronchial asthma and associated conditions yet "causes very little central nervous stimulation and produces little or no pressor action."[1]

85%–90% effective relief in over 1400 patients during an exacting 8-year clinical study

Increased vital capacity better feeling of well being essentially free from undesirable side actions

Its name is **NETHAPHYL®**

Each capsule contains Nethamine® Hydrochloride 50 mg Butaphyllamine® 0.12 Gm and phenobarbital 15 mg
Also available in half-strength.

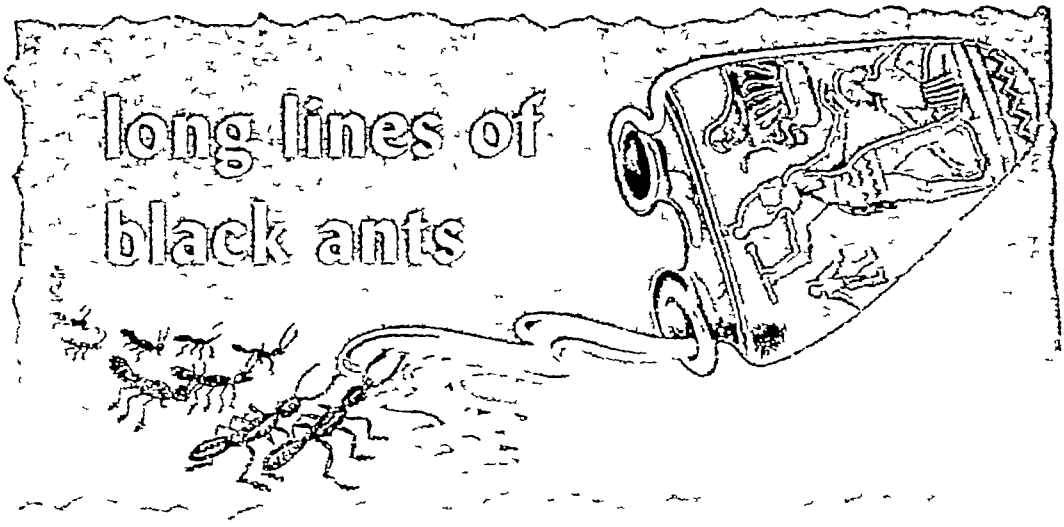
Here's what throat specialists reported about Camel Mildness—

In a recent coast-to-coast test, hundreds of men and women smoked Camels—and only Camels—for 30 consecutive days They smoked on the average of one to two packs a day Each week throat specialists examined the throats of these smokers, a total of 2470 careful examinations, and reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION due to smoking CAMELS"

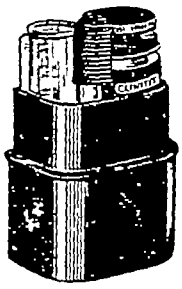
Money-Back Guarantee!

Try Camels and test them as you smoke them. If, at any time you are not convinced that Camels are the mildest cigarette you've ever smoked return the package with the unused Camels and we will refund its full purchase price plus postage. (*Signed*) R. J Reynolds Tobacco Company Winston-Salem, North Carolina.



According to a Nationwide survey:

MORE DOCTORS SMOKE CAMELS



than any other cigarette

Doctors smoke for pleasure too and when three leading independent research organizations asked 113 597 doctors what cigarette they smoked, the brand named most was Camel!

There is a complete line of Beech Nut Strained and Junior Foods.

Long lines of black ants attracted to madhumeha, "honey urine," led the ancient Hindu wise men to observe and recognize diabetic urine, which they described as "astringent, sweet, white and sharp" Avid insects became an acknowledged means of diagnosis Almost equally primitive methods of urine-sugar detection remained in effect for a score or more of centuries, until modern copper reduction tests were perfected, refined and simplified

Simplest of all today is the reliable *Ames* tablet method, performed in a matter of seconds Urine-sugar levels are determined by direct, easily-learned steps The use of *Clinitest* (Brand) reagent tablets has eliminated the inconvenience of external heating Interpretation of routine urine-sugar testing follows readily from color scale comparison

when MIGRAINE attacks

FIRST EFFECTIVE

oral TREATMENT

OF MIGRAINE ATTACK

Sandoz proudly announces the *first effective oral* treatment of migraine—

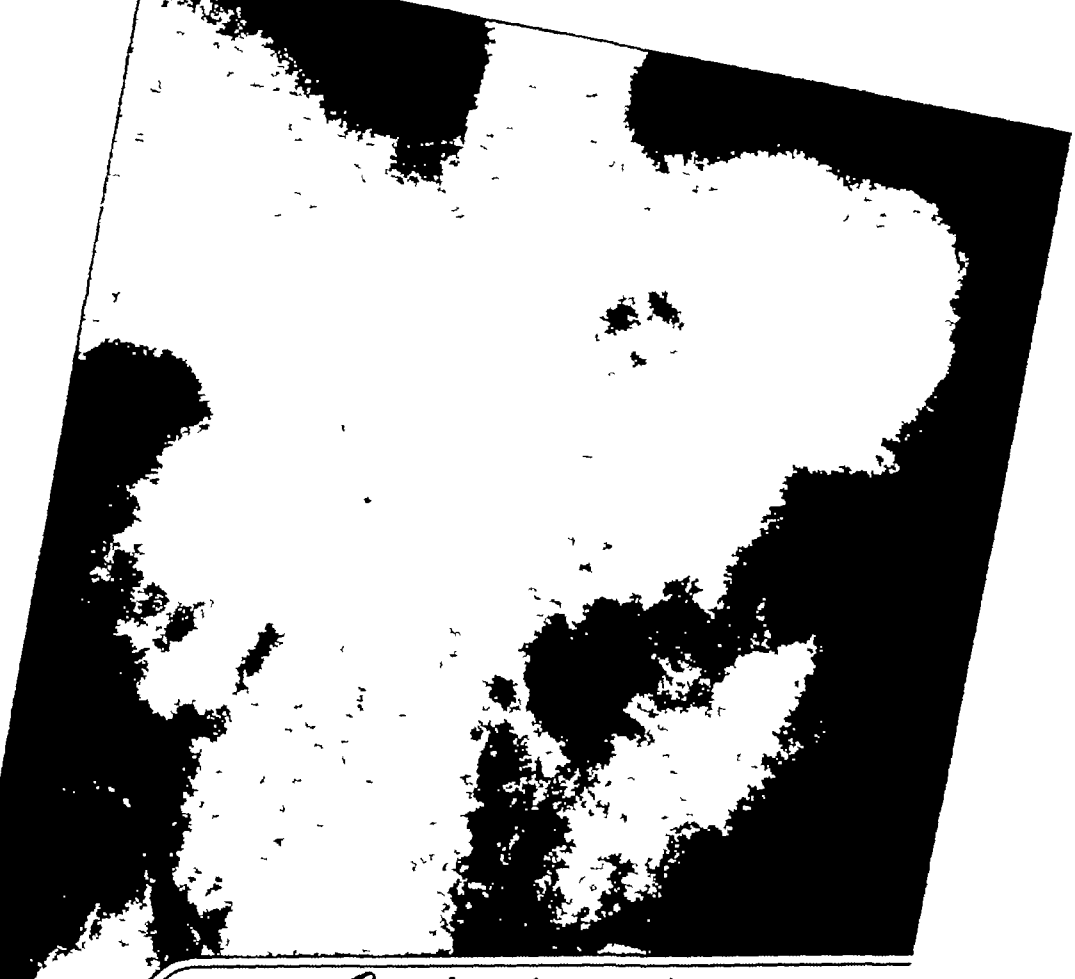
Clinical investigation[1] demonstrated that 80% of a series of cases experienced good results Best results were obtained in migraine, histamine and tension headaches

Friedman,[2] in a large series of migraine cases, found Cafergone 55% more effective than ergotamine tartrate alone

Later reports[3 4] were equally favorable

Cafergone

(ergotamine tartrate 1 mg / caffeine 100 mg)



(Experimentally identified as E.C. 110)

Your help now may spell the difference between unprovided-for old age and economic security

Women in business who are nervous emotionally unstable and generally distressed by symptoms of the climacteric almost inevitably experience a reduction in efficiency as well as earning power

"Premarin" offers a solution Many thousand physicians prescribe this naturally-occuring oral estrogen because

1 *Prompt symptomatic improvement usually follows therapy*

2 *Untoward side-effects are seldom noted*

3 *The sense of well-being so frequently reported tends to quickly restore the patient s confidence and normal efficiency*

4 *This Plus (the sense of well being enjoyed by the patient) is conducive to a highly satisfactory patient-doctor relationship*

5 *Four potencies provide flexibility of dosage 2 5 mg 1.25 mg , 0 625 mg and 0 3 mg tablets also in liquid form, 0 625 mg in each 4 cc (1 teaspoonful)*

Ayerst

While sodium estrone sulfate is the principal estrogen in Premarin ' other equine estrogens estradiol equilin equilenin hippulin are probably also present in varying amounts as water soluble conjugates

LEG ULCERS

the DAXALAN-DOME-PASTE BANDAGE TECHNIQUE

AS INTRODUCED BY DR WILLIAM M. COOPER Director Department of Peripheral Vascular Diseases—New York Polyclinic Medical School and Hospital.

This technique is based on a 3 point program—

1. Reduction of dermatitis with wet dressings of DOMEBORO TABS *(BUROW S SOLUTION)*
2. Combat local infection and stimulate healing with thick application of DAXALAN in the center of the ulcer and surrounding areas.
3. Overcome venous insufficiency stasis and edema by wrapping DOME PASTE BANDAGE around the entire leg to supply compression

when Milk becomes a dietary dilemma

Problem When casein or other animal protein sensitivity renders all natural or processed milks* contraindicated in the pediatric dietary, because of eczematous, gastro-intestinal or other reactions, how can allergy be avoided and proper infant nutrition still be maintained?

Solution Replace milk with Mull Soy, the liquid hypoallergenic soy food—completely free of offending animal proteins Mull-Soy is a biologically complete vegetable source of all essential amino acids, and closely approximates whole cow's milk in fat, protein, carbohydrate, and mineral content when diluted 1 1 with water It is quickly prepared, palatable, easily digested and well tolerated—equally desirable for infants, children or adults.

**Goat's milk and processed cows milk have unmodified casein factors*

attacking arthritis

at the G-I level

With so many arthritics exhibiting evidences of constipation and hypofunction of the gallbladder, liver and kidneys—it is today generally conceded that "proper handling of the gastro-intestinal tract may in some cases be the most important factor in successful management."* The Occy-Crystine formula is frequently used with benefit—to provide effective, non-irritant cathartic and cholagogic action, it is also sulfur-bearing

Composition Occy-Crystine is a hypertonic solution of pH 8 4, made up of the following active ingredients—sodium thiosulfate and magnesium sulfate, to which the sulfates of potassium and calcium are added in small amounts, contributing to the maintenance of solubility

*Nuzum F R.: In Diseases of the Digestive System ed by S A. Portis Lea & Febiger 1944

relax the grip of spasm

The secret of Donnatal Elixir's unusual spasmolytic efficacy lies in its precise balance of the principal *natural* alkaloids of belladonna, plus its minimal content of phenobarbital • By blocking smooth muscle response to cholinergic nerve impulses these alkaloids act synergetically to break the links of spastic reaction and the sedative ingredient helps allay any psychogenic component • Controlled clinical studies—plus broad professional experience—attest its value in gastro-intestinal biliary urogenital respiratory or central nervous spasm

for both somatogenic and psychogenic cases

Candy

MORE THAN JUST FOOD

Although candies are an excellent source of caloric food energy, and supply many valuable nutrients derived from the milk, cream, butter, nuts, peanuts, and eggs used in their manufacture, they provide more than calories and nutrients

Candies make a worth-while contribution to the joy of living They are among the foods which provide true gustatory satisfaction Taken at the end of a meal, they create a sense of having eaten well and are conducive to an aura of satiety which can have a beneficial influence upon the digestive processes

The child, the housewife, the worker, and the convalescent —all appreciate a piece or two of candy as the finishing touch of the mid day or evening meal

THE NUTRITIONAL PLATFORM OF CANDY

1 Candies in general supply high caloric value in small bulk.

2 Sugar supplied by candy requires little digestive effort to yield available energy

3 Those candies in the manufacture of which milk, butter eggs fruits nuts or peanuts are used to this extent also—

(a) provide biologically adequate proteins and fats rich in the unsaturated fatty acids;

(b) present appreciable amounts of the important minerals calcium, phosphorus and iron;

(c) contribute the niacin and the small amounts of thiamine and riboflavin contained in these ingredients

4 Candies are of high satiety value; eaten after meals they contribute to the sense of satisfaction and well being a meal should bring eaten in moderation between meals they stave off hunger

5 Candy is more than a mere source of nutriment—it is a morale builder a contribution to the joy of living

6 Candy is unique among all foods in that it shows relatively less tendency to undergo spoilage chemical or bacterial.

The New Oral Treatment for

New Concept

Psoriasis and neurodermatitis are treated systemically in a new therapy developed clinically by Perlman[1]

The medication used is a refined grade of undecylenic acid specifically selected for oral administration Preliminary reports on clinical usage show definite response in a majority of the cases treated

Why and how this new form of undecylenic acid works is not yet known It is an odd numbered carbon atom unsaturated straight chain fatty acid, and may play an important role in abnormalities in fatty acid metabolism

Description

The undecylenic acid used by Perlman and others for their cases is now available under the name of Declid Undecylenic Acid Capsules

It must be emphasized that all the clinical work reported has exclusively employed only this particular grade of undecylenic acid Ordinary commercially available undecylenic acid supplied for *external uses* is not recommended since its possible effects when taken internally are unknown

Declid Undecylenic Acid is supplied in soft gelatin capsules 0 44 g Uncapsulated the acid is an oily water insoluble liquid with a fatty odor and bitter taste

Clinical Results

Favorable responses in 25 cases of psoriasis and neurodermatitis are reported by Perlman[1]

In the cases reported so far these improvements have been noted in varying degree in the different patients 1 Subsidence of itching 2 Complete or partial disappearance of lesions 3 The probable prevention of recurrence by maintenance dosage

Declid Undecylenic Acid Capsules, 0 44g each, are supplied in bottles of 100

In cases of psoriasis associated with arthropathies, Perlman- noted in a preliminary report that arthritic pains diminished or disappeared following oral undecylenic acid treat

On Prescription Only at Drug Stores

DECLID UNDE

Psoriasis and Neurodermatitis

ment. He has found relief and improvement from symptoms in 6 cases of arthritis and bursitis not complicated by psoriasis and urges further research by others.

Tolerability

Declid Undecylenic Acid has been administered in large daily dosages over long periods without severe side reactions or toxic symptoms.

After taking Undecylenic Acid some patients complain of a bitter taste in the mouth, mild nausea belching or dyspepsia These are relieved by antacids Increased bowel activity is sometimes noted When justified reduced dosage or temporary cessation of treatment is advised. These side effects in most cases, do not reappear when full dosage is resumed.

Dosage

Declid Undecylenic Acid is not a fast-acting drug Quick response should not be expected. The optimum dosage has not been determined. The physician must evaluate each case and adjust the dosage to the response.

The capsules should be taken between meals — *not* on a full stomach Suggested dosage schedule *First week* Four Declid Capsules 3 times daily *Second week* 6 Capsules 3 times daily *After second week* 8 to 10 Capsules 3 times daily if needed and continued for several months or until complete disappearance of lesions Tolerability is enhanced by taking the capsules with a carbonated beverage water or ginger ale

If high dosages are taken over long periods frequent urinalyses and blood counts are recommended.

Adjunctive Therapy

In some cases the response to Declid Undecylenic Acid has been accelerated by external use of a medicated ointment such as ammoniated mercury 3% and salicylic acid 3% in anhydrous lanolin petrolatum base.

Contraindications

Oral therapy with Declid Undecylenic Acid is new and much is still unknown about its effect on metabolism Therefore *it should be administered with caution,* and not to debilitated diabetic or hypertensive patients or those with coronary or gall bladder symptoms

Why Many Physicians Write It

CARSTAIRS

when whiskey is indicated

MORE and more well informed physicians are recommending light blended whiskey to their patients when whiskey is medically indicated Reason

Neutral spirit blends contain few congeners, such as fusel oil, tannins, aldehydes, esters, furfurals, acids, etc That means they're not only light but mild, too What's more, they're usually around only 86 proof (43% alcohol by volume)

One of America's leading whiskies of this type is Carstairs White Seal It is blended with care by expert distillers devoted to the highest quality standards Their insistence on perfection has made Carstairs famous as the Perfectly Balanced Blend

Whenever whiskey is indicated, may we suggest that you recommend that superb blend—Carstairs White Seal—to the patients in *your* care?

The Medical Man who Cares says

INTRODUCING...

THE KOROMEX JELLY REFILLABLE UNIT

Physicians acclaim the new Koromex all inclusive contraceptive unit This fine container is ivory-colored plastic, permanent dust proof attractive for home use and ideal for traveling It contains two regular size tubes of Koromex Jelly which rest in individual compartments a Koromex Diaphragm stored in the ingeniously constructed cover compartment and a Koromex Measured Dose Plunger Applicator that rests securely on its own rack.

Where pregnancy is contra-indicated recommend the complete Koromex Jelly Refillable Unit to your discriminating women patients.

For those of your patients who require a slightly less lubricating but equally effective spermicidal preparation a similar companion package containing two tubes of Koromex Cream instead of Koromex Jelly is also available

ACT E INGREDIENTS BORIC ACID 2 0% OXYQUINOL H BENZOATE 0 02 AND PHE YLMERCUR C ACETATE 0 02% IN SUITABLE JELLY OR CREAM BASES.

Findings from the Saratoga Spa records*

CARBON DIOXIDE BATHS

Many observations have been made on the changes which occur in the alveolar carbon dioxide tension, the skin temperature, and the respiratory metabolism of human subjects who have been submerged in baths of either carbon dioxide water or plain water

The alveolar carbon dioxide tension showed a 5 to 10 per cent rise during baths in the carbon dioxide water, and returned to the resting level about twenty minutes after the bath There was no significant change during baths in plain water

There was no essential difference in the skin temperature during the carbon dioxide and plain water baths

There was a marked increase in the elimination of carbon dioxide in the expired air during the time the patient was in the mineral water bath This increase did not occur in the plain water bath

No evident variation in the oxygen consumption occurred with either bath

The possible source of the excess carbon dioxide is discussed The evidence supports the theory that this extra carbon dioxide is obtained by absorption of the carbon dioxide in the water through the skin and its subsequent elimination through the lungs

It is, therefore, concluded that the results obtained in the treatment of patients with carbon dioxide mineral water baths depend, in part, at least, on the absorption of carbon dioxide through the skin and its subsequent influence on the circulation and nervous system which occurs in the process of its natural elimination by way of the blood stream and the lungs

* *As printed in American Heart Journal, Vol 29 No. 1 Pages 44-61 January 1945.*

The SARATOGA SPA

'Physician, Give Heed to Thine Own Health"

Many physicians have come to the Spa for the same kind of treatments that have helped their patients here After a restorative "cure" at the Spa, you, too will return to your practice—refreshed—revitalized—ready for the busy days that lie ahead

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

Optimal Nutrition

SO VITAL FOR OPTIMAL HEALTH

In the achievement and maintenance of optimal health, no other single influence looms so vital as sound nutrition In fact, so important is this principle to preventive medicine that *optimal nutrition* has become the basis of all modern day health programs

When nutritional health is threatened, as in dietary restrictions often imposed by disease, or during convalescence, or when the nutrient intake is insufficient because of other reasons, the *multiple dietary supplement* Ovaltine in milk is especially useful for overcoming nutrient deficiencies of the diet

Three glassfuls daily may readily supplement even poor diets to adequacy Easy digestibility makes its many valuable nutrients—vitamins, minerals, biologically complete protein, and food energy—quickly available The pleasing flavor adds to its wide applicability and usefulness

The table below gives the amounts of nutrients in three glassfuls of Ovaltine in milk

THE WANDER COMPANY, 360 N MICHIGAN AVE , CHICAGO 1, ILL

Ovaltine

*Three servings daily of Ovaltine each made of ½ oz of Ovaltine and 8 oz of whole milk * provide-*

CALORIES	676	VITAMIN A	3000 I U
PROTEIN	32 Gm	VITAMIN B_1	1 16 mg.
FAT	32 Gm	RIBOFLAVIN	2.0 mg.
CARBOHYDRATE	65 Gm	NIACIN	6.8 mg.
CALCIUM	1 12 Gm.	VITAMIN C	30 0 mg
PHOSPHORUS	0.94 Gm.	VITAMIN D	417 I U
IRON	12 mg.	COPPER	0.5 mg.

*Based on average reported values for milk.

Two kinds, Plain and Chocolate Flavored. Serving for serving they are virtually identical in nutritional content.

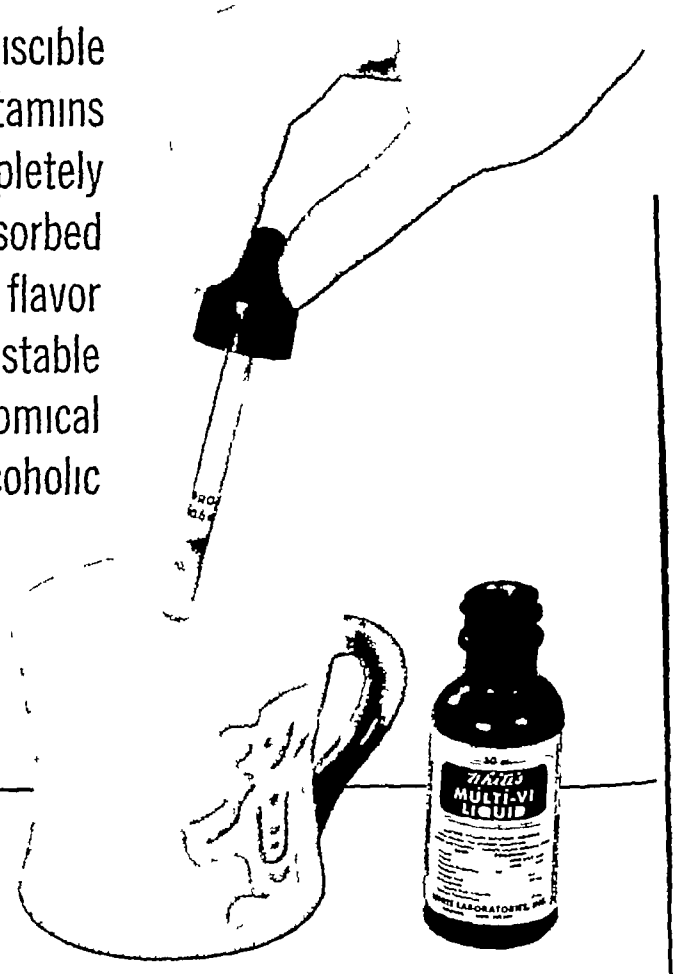
These are nutritional gaps in human milk

. THEY CAN AND SHOULD BE CORRECTED

Both human and cow's milk fail to provide sufficient amounts of practically all essential vitamin B factors for optimum nutrition in the average diet of early infancy

The gap (shown in gray) between optimal levels of these vitamins and the amounts supplied by human milk (shown in red) is illustrated in the chart to the right White's Multi-Beta Liquid is specifically formulated to correct these "nutritional gaps" in the infant diet

"It is suggested that the diet of normal neonatal infants, as well as premature, be supplemented by the addition of B complex vitamins to both breast fed and artifically fed infants from the onset of feeding"



Kasdon S C and Cornell, E L Vitamin B Complex in Neonatal Feeding, Am Jl Obs & Gyn. 56.253 (Nov) 1948

White's Multi Beta Liquid, in a dosage of five drops or more daily, raises the infant's intake of all clinically important vitamin B factors to adequate protective levels Notably stable, non alcoholic, freely soluble in milk mixtures and orange juice White Laboratories, Inc , Pharmaceutical Manufacturers, Newark 7, N J

White's **Multi-Beta Liquid**

ONE OF White's INTEGRATED PEDIATRIC VITAMIN FORMULAS

water miscible
all essential vitamins
disperses quickly, completely
readily absorbed
pleasant flavor
stable
economical
non-alcoholic

White's

MULTI-VI LIQUID

One of White's INTEGRATED pediatric vitamin formulas

Now these advantages are all available to physicians in this single, pleasantly flavored, *aqueous* multiple-vitamin formula in "drop dosage" form The vitamin D content is Vitamin D_3 which, unlike viosterol, is chemically identical with the Vitamin D of cod liver oil Provides average infant with adequate protective amounts of all clinically important vitamins at a cost of about two cents per day In bottles of 10 and 30 cc

WHITE LABORATORIES, Inc , Pharmaceutical Manufacturers, Newark 7, N J

FORMULA: Each 0.6 cc. contains:

Vitamin A	5000 U S.P units
Vitamin D_3	1000 U S.P units
Thiamine Hydrochloride	1 0 milligram
Riboflavin	0 4 milligrams
Pyridoxine Hydrochloride	1 0 milligram
Sodium Pantothenate	2 0 milligrams
Nicotinamide	10 0 milligrams
Ascorbic Acid	50 0 milligrams

External Cod Liver Oil Therapy

DESITIN OINTMENT

Contains Crude Cod Liver Oil Zinc Oxide Talcum Petrolatum and Lanolin

Used effectively in GENERAL PRACTICE for the treatment of Wounds Burns Indolent Ulcers Decubitus Intertrigo Skin Lesions Hemorrhoids Anal Fissures, etc

In PEDIATRICS for the treatment of Diaper Rash Exanthema Chafed and Irritated Skin caused by Urine Excrements or Friction Prickly Heat and in the nursery for General Infant Care

Fatty acids and vitamins are in proper ratio thereby producing optimum results Non irritant, acts as an antiphlogistic allays pain, stimulates granulation favors epithelization Under Desitin dressing, necrotic tissue is quickly cast off Dressing does not adhere to the wound. In tubes 1 oz. 2 oz. 4 oz., and 1 lb jars

Desitin Medicinal Dusting Powder is superfatted with crude cod liver oil in a non irritating powder base. Indications In infant care in the treatment of IRRITATED SKIN SUPERFICIAL WOUNDS DECUBITUS, INTERTREGO PRURITUS and URTICARIA. In 2 oz. Shaker Top Cans

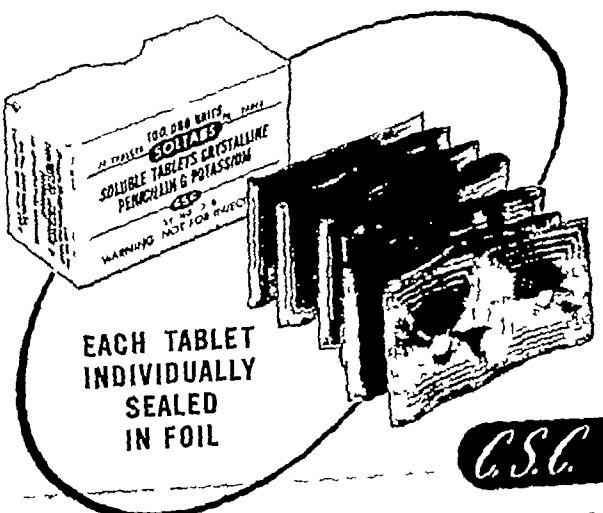
SOLTABS®

CSC



The New Registered Name for SOLUBLE TABLETS CRYSTALLINE PENICILLIN G POTASSIUM

For convenience in prescribing, SOLTABS has been adopted as the new name for Soluble Tablets Crystalline Penicillin G Potassium-C S C When you use the name Soltabs on your prescription you are assured of your patients' receiving the original penicillin soluble tablet

Now in 2 Potencies

100,000 AND 50,000 UNITS PER TABLET

Repeated requests for a higher potency tablet have resulted in the introduction of 100,000 unit Soltabs These tablets, like the 50,000 unit tablets, contain neither binder or excipient Soltabs are widely used in pediatrics for oral administration of penicillin dissolved in the milk formula or in water Also applicable in aerosol inhalation therapy where they greatly simplify dosage calculation and preparation of solutions for administration

SUPPLY

Soltabs—Soluble Tablets Crystalline Penicillin G Potassium-C S C —are supplied in boxes of 24 tablets, 50,000 units or 100,000 units per tablet, each tablet individually sealed in foil

Facts About Conception Control

Clinicians generally favor the use of an occlusive device supplemented by a sperm-immobilizing agent for optimum protection However, authoritative studies have established that a high degree of protection is afforded by use of a jelly alone—provided that the jelly has rapid spermatocidal action together with adhesive and cohesive properties sufficient to provide a dependable barrier

When dependence must be placed on the "jelly alone method, there is no better product available than "RAMSES"* Vaginal Jelly† because

1 It provides rapid spermatocidal action

2 It possesses dependable adhesive and cohesive properties—will not melt or run at body temperatures

3 Direct-color photographs show that it will occlude the cervix for ten hours

RAMSES Vaginal Jelly is available in regular and large-size tubes through all pharmacies

ACCEPTED Chemistry Pharmacy Medicine

The reaction rate of Amphojel and its component gels.

the double action of AMPHOJEL®

antacid
demulcent

Amphojel — Aluminum Hydroxide Gel, Alumina Gel Wyeth — is unique because it is a colloidal mixture of two essentially different types of alumina gel, one having an antacid effect the other a demulcent action

The "antacid gel" instantly stops gastric corrosion and establishes a mildly acid environment

The "demulcent gel" provides a prolonged local protective effect, and might be likened to a "mineral mucin"

Thus, through its double action, Amphojel gives you an ideal preparation for use in the management of peptic ulcer

SUCTION SOCKETS

Artificial legs without hampering straps have been the shining hope of amputees Recently, the development of the Suction Socket Leg for above knee amputees seemed to realize this hope

We understood what this type of limb could mean to the amputee But we knew that these limbs were not perfected Thus in 1947, we joined with the Committee on Artificial Limbs and the VA in a program of research on the Suction Socket Limb Under this program veteran cases have been awarded by the VA to companies having certified suction socket fitters To date we have fitted well over 100 suction socket cases of which 90% have been satisfactory

Results of research show only about 20% of cases suitable for suction sockets Results also show that close cooperation with doctors is necessary Hanger is continuing research toward the amputee's great hope and will keep the medical profession informed of its progress

A Look at the Record

At hearings on H R 782 by the House Committee on Expenditures in the Executive Departments, Dr John W Green, a member of the House of Delegates of the A.M.A., spoke on behalf of that body favoring the creation of a Department of Health under a Secretary with cabinet status rather than a department covering education, welfare, and health

The American Medical Association is strengthened in its position that there should be a single Department of Health by the reports recently submitted to the Hoover Commission. It is apparent that one of the nation's greatest interests is in the health of its citizens, and health is of such a nature that, to be most effective, it must be individualized The Association has recently issued a program emphasizing the importance of this point of view Dr Green said that examination of the minutes of the House of Delegates of the American Medical Association shows that considerable thought was given over a period of years to the formulation of a separate Federal health agency References and records of action taken appear repeatedly in the minutes. As early as 1884 at the annual session it was urged that a separate Department of Health be established under a cabinet officer In 1891, a committee of 23 members was appointed to petition Congress on this matter Further references appear in the minutes of the annual sessions each year from 1891 up to and including 1902 The subject apparently was not discussed during the three succeeding years, but reappears annually from 1906 to 1913, and from 1917 to 1930 After five years, a resolution was introduced into the special session of the House held in Chicago in 1935 urging the President of the United States to establish a separate Department of Health. At the session of the House of Delegates in San Francisco in 1938, the House adopted the following recommendation of the reference committee on legislation and public relations " your committee recommends that the house of delegates reiterate its demand for a Federal executive department to be designated as the Department of Health, with a doctor of medicine at its head who shall have general supervision and direction of the affairs of the Federal govern-

ment pertaining to the health of the people" From the foregoing it will be seen that the American Medical Association has repeatedly gone on record as being desirous of seeing legislation passed leading to the formulation of a separate national Health Department Current opinion in the Association at the present time is to the effect that this department should be a department separated from other activities of the government

Congress in 1879 passed legislation authorizing a National Board of Health The functions and relations of this unit with other departments were very poorly defined in the law, and no money was appropriated for its activities The legislation remained on the statute books without any action until 1893, at which time it was repealed

It has been estimated that educators are concerned in some manner with approximately 28,000,000 members of the population Social security has contact with about 51,000,000 people, including recipients as well as taxpayers Medicine, on the other hand, has a much broader and more personal contact and, in fact, enters into the lives of all of our people

There is some difference of opinion as to whether the secretary should have the qualifications of a practicing physician, or whether his duties could not be discharged as well if he were not a medical practitioner We cannot accept the statement which has been made, that a physician competent to manage such a department or bureau cannot be found [1] To us it seems that the first function of such a department should be to guarantee the public that it will have available adequate medical care This involves decision and perspective in the medical and public health fields which only a trained practicing physician can possess Good administration is vital, and the secretary should have as his aide an undersecretary who is a thoroughly trained administrator

The medical and allied professions have always responded admirably to the call of government for the security and defense of this nation Under these proposals the country's medical personnel and facilities lend themselves to effective cooperation and support of any defense measure or plan of organization adopted

[1] Dr Ray Lyman Wilbur former Secretary of the Interior a member of the cabinet of President Herbert Hoover 1929-1933

Publications of the Society

The columns of the JOURNAL are now, as in the past, principally devoted by the Society to the publication of the excellent scientific papers representing the research and clinical observations of the membership and of guests invited to the Annual Meeting A large number of new contributions to scientific progress in medicine as well as extended clinical observations and reports emerge from each meeting

Subject only to necessary editing to compress the contents and illustrations within the limitations of paper available and mechanical costs of production, no restrictions impede the free progress of scientific and clinical knowledge One of the purposes of the establishment of the JOURNAL was to encourage in the membership of the Society potential medical authors, another purpose was to create a medium for the distribution to the membership of a continuous record of official business, so that each physician could know and preserve if he wished a handy reference to the transactions of his State Society These purposes have been fulfilled

As the Society grew, the necessity for a new function arose, that of interpreting the doctor to the public The JOURNAL could not be adapted to this purpose In consequence, a Bureau of Public Relations was established to undertake this function Writing for the public differed greatly from the kind of scientific expression to which physicians were trained and was acknowledged to be a special technic However, such a bureau had to be integrated with the scientific publication and with the *Directory* This was accomplished finally about 1937 by the establishment of a House of Dele-

gates Committee on Publications, with the Bureau of Public Relations represented by its Director as a member

Through releases to the press, and by publication of its mimeographed *News Letter*, the Public Relations Bureau conveys news of the Medical Society of the State of New York to sources outside the profession and to the component county societies This news is in compressed form and can be circulated quickly following the occurrence of any newsworthy e
in terms the man on the
comprehend

These are the functi
tions of the Society, i
under the guidance o
Committee and the Pub... Relations Committee The former also publishes the *Directory* at intervals ordered by the House of Delegates, and this is sent free to every member of the Society in good standing

Current Editorial Comment

Name Committee Head Dr Theodore J Curphey, Chief Medical Examiner for Nassau County, has been named chairman of the Council Committee on Public Health and Education of the Medical Society of the State of New York.

Dr Curphey was appointed to fill the place left vacant by the death last December 20 of Dr Oliver Wendell Holmes Mitchell, professor of hygiene and public health at Syracuse University As chairman of the Committee of Public Health and Education, Dr Curphey will carry on the program of postgraduate medical education which last year provided lecturers and teachers for a total of 180 medical groups in various parts of the State This program, which the late Dr Mitchell was instrumental in developing with the cooperation of the New York State Department of Health, has become increasingly important in bringing to practicing physicians many of the latest developments in the medical sciences

The Legislative Bureau. This important function of the Medical Society of the State of New York, headed by the Executive Officer, Dr Robert B Hannon, and the hard-working Council Committee on Legislation, merits far more recognition than is seemingly accorded to it by our membership In this State the legislative session is short, commencing in January and ending usually late in March or early in April Of recent years the flood of bills submitted has become ever greater, and those directly or indirectly affecting medical education, research, and the practice of medicine in the State have become more complex and wider in scope

The excellent *Legislative Bulletin* prepared by Dr Hannon and sent out by the Executive Office in Albany provides information and comment on all legislative proposals affecting medicine and the public health, together with notice of the state of progress of the individual measures The editors of the JOURNAL regret that, because of the short legislative session, and the unavoidable lag in editing and printing of material, we are precluded from making extended comment on current legislation in our columns for the benefit of our membership However, the *Legislative Bulletin* and the *News Letter* of the Public Relations Bureau do reach a large number of key personnel, legislative chairmen of the constituent county societies for example, within a short time after important legislation is introduced at Albany

Although the JOURNAL cannot report "spot news," it can remind the membership of the Medical Society of the State of New York of the importance of personal communication with members of both branches of the legislature Only if the assemblymen and senators know your opinions can they act upon them Assist your Executive Officer by making your views known

What Every Doctor's Wife Should Know An exceedingly valuable booklet with this alluring title has been issued by the Public Relations Bureau of the State Society It is a study guide in the problem of medical care prepared by the Woman's Auxiliary of the Nassau County Medical Society and constitutes an excellent basis for similar groups throughout the State Great credit is due to the ladies who have instituted this important activity, and the booklet is worthy of attention Doctor's wives can do a great deal to bring the problems associated with medicine to the attention of their individual communities

DEVELOPMENTS IN PUBLIC HEALTH

From the New York State Department of Health

William A Brumfield, Jr , M D , Editor

Medical Profession, Hospital, and Health Department Cooperation to Improve Care of Newborn Infants

It is unnecessary to dwell on the fact that every newborn infant in a hospital should be surrounded by a system of safeguards designed to afford the maximum feasible protection from infection The solution of the complex problem of managing a nursery in such a way that high standards of care are maintained around the clock requires from the medical profession the type of leadership and teamwork with the hospital administration, nursing profession, and health departments referred to below

One of the potential disasters facing every hospital administrator, physician, and nurse responsible for the care of newborn infants is epidemic diarrhea of the newborn The clinical picture, which is grossly the same in the various outbreaks, is apparently due to a variety of etiologic agents The mechanism of spread is not always evident from epidemiologic study The mortality rate varies from zero to fifty per cent with no objective criteria for predicting the ultimate outcome An approach to control must be in part specific and in part empiric and aimed at preventing the introduction and spread of infection in hospital nurseries The adoption and application of minimum standards for nursery care of newborn infants is the inevitable answer to the problem in the light of our present knowledge

The basis for the standards adopted by the Public Health Council has several components Epidemiologic study of twenty-eight epidemics of diarrhea reported in New York State during a six-year period, comprehensive survey of scientific literature, recommendations of the American Academy of Pediatrics, recommendations of the Children's Bureau, analysis of the Michigan State Health Department's five-year research studies of etiology and prevention, and laboratory studies in the Division of Laboratories and Research, State Department of Health [1]

Appropriate committees of the Medical Society of the State of New York were consulted, together with executives of the State Hospital Association, the chairman of the subcommittee on terminal heating methods of the American Hospital Association, professors of pediatrics in New York State, and many other consultants and investigators interested in the problem

During the last eight months of 1948 the standards have been presented to the upstate hospitals through official notifications and appropriate literature dealing with the problem Eleven institutes on diarrhea of the newborn were attended by 982 hospital administrators, nurses, practicing physicians, and health officers Consultation to individual hospitals by health department personnel is continuing to assist the hospitals in establishing policies and procedures which will meet the principles of nursery care established by the regulations effective January 1, 1949

The standards have been endorsed individually by members of the Committee on Fetus and Newborn of the American Academy of Pediatrics and sent by the Committee to its subcommittees in forty-six states and the territories with the recommendation that similar legislation be secured Current editorial comment has approved the new regulations [2] Thus the New York State cooperative effort by the medical profession, hospitals, and health departments to improve the standards of nursery care emerges

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Appetite as a Guide to Nutritional Needs

It is not uncommon for a physician who has prescribed a specific corrective diet to hear his patient say, "Doctor, my appetite will guide me Somehow I just don't like things that are not good for me" Such a comment may be related to a fairly common belief that when animals and children are left to their own devices, uninfluenced by education, example, religion, or other considerations, they will select an adequate diet if appropriate foods are available If this is true, many of the studies in the interest of better nutrition are obviously unnecessary and even wrong Since the busy physician infrequently has his attention called to the pros and cons of this complicated question, it is the purpose here to review briefly the ideas and the experiments which are pertinent to the subject

Appetite is the basis of a voluntary food consumption which is stimulated by pleasurable sensations and particularly by the body's need of food Richter adheres to the view that appetite can serve as a reliable guide to nutritional needs [1] He explains the phenomenon on the basis of instinct or "sixth sense" and supports this hypothesis by reports which indicate that parathyroidectomized rats show an increased appetite for calcium, adrenalectomized animals for sodium, and pancreatectomized animals a decreased carbohydrate and increased fat appetite These findings, together with studies of various purified or synthetic nutrients, have caused this group to conclude that a close relationship exists between appetite and nutritional needs which is reflected in specific choices in response to the internal environment and independent of experience [1,2]

Others who are impressed by the important role that appetite can play in the right food selection believe that ability to discriminate depends, not on instinct, but on an association between the distinctive character of the diet and the beneficial effects experienced from its consumption Thus they speak of a "learned" or "educated" appetite, which results in right choices [3]

There is little support for either of these views that appetite, either through a "sixth sense" or by becoming educated, results in correct nutrient selection Scott and his associates have published a series of papers on the subject during the last five years These studies have dealt with various proteins, fats, carbohydrates, minerals, vitamins, and flavors In discussing the results, Scott stresses the significance of hunger for calories but considers that preferences for specific kinds of foods "to be haphazard as regards nutrition," leading with equal probability to good or bad choices [4]

Davis has published two studies on infants who, when weaned from the breast, were never subjected to parental guidance in their eating habits, nor had they been given processed or "well-seasoned" foods [5,6] The author reports that the infants chose, from a supply of simple and natural foods, diets which were satisfactory for their development The foods made available were of high nutritional quality, however, and sweet desserts, candy, and processed foods were not included The eating was under a supervised self-demand schedule, which is now recognized to give better results than a precise clock-run regime It is clear in these studies that, by reducing the

possible errors of selection to a minimum and by promoting the proper attitude toward food, the results were good It was not clearly demonstrated, however, that these results reflected an instinctive or learned appetite based upon specific nutritional needs

The evidence which has been reviewed for this page reveals many striking examples of wise choices based on instinct or beneficial experience Many experiments reveal, however, examples of a total failure to take advantage of an opportunity to choose a diet in accordance with nutritional needs, even under apparently very favorable conditions On the basis of the present evidence it must be concluded that, in general, appetite is an uncertain guide to nutritional needs except in the case of calories

With the advantage of some experimental evidence, physicians may find it of interest to question further those patients who believe they are endowed with a power of selection of food which is nutritionally adequate They may find that some patients use the device of rationalization to evade the emotional impact which they experience with a change of food habits At present, it appears certain that the doctor should insist on his diet prescription and not leave to chance the inclusion or deletion of valuable nutrients

DEVELOPMENTS IN PUBLIC HEALTH

[Continued from page 1148]

as a pioneer effort attracting national interest The success of the program rests with the physicians, administrators, and nurses responsible for the care of the newborn Sound medical leadership and support of the administration and of the nurses is mandatory if a hospital is to succeed in providing continuous high level protection for infants Physicians should lead the way in establishing policy through committee action, through setting the level of nursery technic by example in handwashing, gowning, prompt use of "suspect" nurseries, and supporting nurses in their efforts, and through interpreting favorably to the public simplified technics, changes in hospital routine, and restrictions on visitors No person is in a more responsible or opportune position for the protection of the newborn and the education of the public than the practicing physician

HISTAMINE IONTOPHORESIS IN THE THERAPY OF MULTIPLE SCLEROSIS

HAROLD A ABRAMSON, M D , New York City

(From the First Medical Service and the Laboratories of Mount Sinai Hospital)

THE treatment of multiple sclerosis by the intravenous administration of histamine, reported by Horton and his coworkers, has met with success in certain cases [1–4] Intravenous administration of this drug, however, has several disadvantages (1) The veins must be punctured repeatedly for months and possibly years, (2) sterile equipment must be employed, (3) a physician or other highly trained personnel must administer the treatment, (4) it is expensive, and (5) hospitalization is desirable

Previous investigations by the writer and his coworkers have shown that if histamine is introduced into the human skin by iontophoresis* (electrophoresis), the drug may remain in the pores of the skin for as long as two weeks [5–8] Histamine depots in the skin are readily demonstrated by using the positive pole over the depot to produce a secondary whealing reaction after the wheal has disappeared, or, by using the negative pole, the drug may be withdrawn electrophoretically into the absorbent material The histamine in the absorbent material may then be demonstrated by iontophoresis into another site by wheal formation Although there was evidence that barriers existed within the pores to prevent diffusion readily, it appears on the basis of the data to be presented here that these barriers are broken down with sufficiently high concentrations of histamine and that histamine is released spontaneously into the blood stream from the depots in the skin without an imposed electrophoretic field

It is the purpose of this communication to show that comparatively large doses of histamine may be given by iontophoresis without damaging the skin in cases of multiple sclerosis By using the direct current in this way the general pharmacologic vasodilating effect is readily obtained by the iontophoretic technic By suitably controlling the area of the electrode, the concentration of the drug, the current, and the time, iontophoretic therapy is essentially transformed into the equivalent of intravenous therapy without, however, puncturing the skin No sterile solutions are required The electrical method is feasible without damage to the skin and does not require hospitalization. Most important is the fact that it is simple enough to be used in the home by the patient and his family, after proper instruction and using equipment costing less than $50 It is anticipated that the simplicity of the equipment will adapt itself to fulfilling the criteria of therapy suggested by Brickner and Franklin and Franklin and Brickner, who stated, "The hypothesis calls for continued vasodilatation of the vessels of the nervous system as well as for the prevention of spasm Both these measures should be enforced for twenty-four hours a day A drug-free interval of even a few minutes would suffice for an attack."[9–11]

Although the iontophoretic method has not been employed continuously for twenty-four hours, the flexibility of the method provides for its rapid modification so that the drug may be administered either interruptedly or continuously, as desired, without injury to the skin Following our method of therapy, secondary flushes have occurred spontaneously in about half of the patients, thus providing evidence that histamine may be released from the skin depots hours after the iontophoretic treatment It is the purpose of this preliminary communication to make available for study and use in therapy the procedure and clinical results thus far achieved

Method

In general, the previous technic, described by the writer for the iontophoresis of epinephrine in asthma, was employed, with certain modifications required for histamine [12 13] Only one lead of the equipment was used, although it is possible to treat three separate areas of the skin, either in

This research was supported in part by grants from the Josiah Macy Jr Foundation and the Foundation for Research in Pulmonary Disease.

The author is indebted to Mrs. Erna Teige for obtaining much of the data and assisting in the development of the technic.

* Apparently Ebbecke was the first to introduce histamine into the human skin by iontophoresis (personal communication of Dr P Rous)

succession or simultaneously Canton flannel, 3 inches wide and 12 inches long, was folded twice over lengthwise, so that the final area was approximately 12 square inches This was applied to the anterior aspect of the forearm with the required concentration (up to 1 per cent) of histamine acid phosphate solution, and contact was made with an electrode of aluminum foil which was held by a rubber pad and strap against a flat, copper positive plate * Current up to 8 ma with this area has been employed, although not more than 5 ma have been recommended for home therapy The current density, therefore, has generally not exceeded 2/3 ma per square inch This current density may be exceeded, but it is believed that no change should be made until further investigations have been made on the patient's general reactions and the blood pressure

The blood pressure, pulse rate, oscillometric index, and temperature were followed, as well as the subjective response of the patient The patient is told to expect a flush and possibly throbbing of the blood vessels in the head This relieves most of the anxiety connected with the first experience of the flush In general, the length of each treatment is fifteen minutes with the concentration of the solution increased in three steps from 1/4 to 1 per cent with the current increased from 2 to 8 ma, depending on the reaction of the patient Oscillometric readings were obtained in the upper part of the forearm Certain patients complained of abdominal discomfort which was probably due to the liberation of gastric hydrochloric acid An antacid mixture of glycine, three parts, and calcium carbonate, seven parts, was routinely administered in the form of tablets, two before and two after therapy ** Further details of the investigative and therapeutic plan will be presented in the brief descriptions of cases studied during the past year

Case Reports

Case 1.—W B was an adult male, thirty years old, who had had multiple sclerosis for eight years There had been a variety of symptoms which need not be discussed here This patient was first treated by wetting canton flannel with 12 cc of distilled water and then crushing and spreading 10 tablets of histamine acid phosphate, each containing 1 mg of histamine, on the side of the canton flannel to be in contact with the skin In this way a high concentration of histamine was placed adjacent to the skin without using much histamine The canton flannel may be used again after rinsing in tap water and wringing in a dry towel to remove excess liquid With approximately 5 ma for fifteen minutes the primary flush appeared on the face in eight minutes with a wheal lasting several hours It is of interest that with this technic, employing a comparatively small quantity of the drug, the flush appeared for ten consecutive days (the weekend interrupting therapy) after eight to ten minutes of therapy Note in Table 1 the oscillometric readings obtained from June 3 to June 16, using ten tablets as the source of histamine There was little, if any, change in the oscillometric index As a matter of fact, it appears that with this dosage of histamine there was a slight decrease in the oscillometric index with a shift of the index pressure curve to a different position There was usually a slight decrease in the diastolic pressure After ten days of this type of therapy the primary flush took somewhat longer to appear Whether the variation in the reaction of the patient was due to the difficulty of getting a uniform distribution of the histamine on the surface of the canton flannel, or whether it was due to an increased tolerance of the skin toward histamine cannot be stated at this time However, in order to avoid irregularities in the distribution of the histamine on the canton flannel a 1 per cent solution of the drug was made up and with suitable dilution was employed in therapy

The technic was now changed, and 10 cc of 1/4 to 1 per cent solution of histamine was used to wet the canton flannel directly When the canton flannel was saturated with 10 cc of 1 per cent solution, the flush usually occurred at the end of four to five minutes with warmth occasionally felt in both legs Oscillometric data obtained on the forearm from July 19 to July 22 are indicated in Table 2 A slight drop in the diastolic pressure occurred with little, if any, change in the oscillometric index On occasion, the index was apparently increased slightly This was also observed occasionally with individuals weighing less than this particular patient, but no consistent increase in oscillometric index was found

During the period of therapy this patient was able to resume dancing and stated that he could snap his fingers, which he had been unable to do previously He worked full time and was on his feet a good deal in his occupation When therapy was discontinued during his vacation, there was a slight numbness in the little finger which was apparently not improved when he resumed therapy At the end of a week's vacation with no therapy, his fatigue increased, and he was not able to dance as well It is of interest that a wheal formed spontaneously on the forearm at the site treated with histamine on exposure to the sun during his vacation, about four days after the last treatment This is further evidence that histamine depots remain within the skin and can be activated not only by electrical forces but by other physical modalities, e g, light

This patient also experienced secondary flushes hours after the administration of histamine, usually occurring in the afternoon five or six hours after the depot was established It is not known how long the primary flushes lasted It is believed that on this patient the primary flush lasted less than an hour

Thus far, the patient has received 55 iontophoretic treatments on the anterior aspects of the forearm without any observable injury to the forearm. It is believed that too little histamine has been given to this patient and that, if therapy is continued, higher

dosage with greater frequency of treatments would be desirable Most striking in this patient, as well as in others, was that immediately after therapy the gait was definitely improved, even though the patient has been sitting in a cramped position for fifteen to twenty minutes and the blood pressure had dropped considerably On the other hand, as mentioned previously, the numbness in the fingers did not decrease during therapy

Case 2.—Y S, thirty-two years of age, married, had had multiple sclerosis for five and a half years Her gait had deteriorated progressively so that it has been difficult for her to get about for the past four years On her first visit, 1/4 per cent histamine solution was given for fifteen minutes with a current of 3 1/2 ma. The first flush was observed at ten minutes The oscillometric index, if anything, showed a slight drop, with the blood pressure dropping from 118/88 to 100/80 The next morning the patient reported that she was worse Therapy was continued, however, and the dose increased to 1 per cent histamine The blood pressure invariably dropped after this therapy, usually starting at 115/80 and dropping to approximately 90/60 The primary flush began at six minutes It is of interest that this patient was much better after treatment with the 1 per cent solution and was almost able to walk alone, in spite of the fact that the blood pressure dropped considerably As the dosage and current was increased, the primary flush began at five minutes with an accompanying throbbing at the back of the head and secondary flushes occurring at home several hours after therapy at the office Headaches occurred which might be connected with the release of histamine from the skin Therapy will be continued at home

Case 3.—F B, aged fifty-one, was an advanced case of multiple sclerosis confined to a wheelchair His symptoms were worse in hot weather During the summer of 1948, he was treated with 1 per cent histamine solution. This is mentioned specifically because the usual primary flush was not observed, although the patient reported that he had felt better since beginning therapy His vision especially improved This patient also reported secondary flushes within twenty-four hours after the histamine depot had been established in the skin. This patient, as well as others, have reported that therapy improved their ability to focus on an object There is a striking increase in muscular strength Therapy is being continued at home

Case 4.—J S was a thirty-six-year-old married woman with two children She had had multiple sclerosis for approximately four years Two years before she improved slightly following a course of intravenous histamine She had much difficulty in walking when she was first seen by the writer and was unable to use the subway or go shopping Treatment was begun on July 12, 1948, with 1/4 per cent histamine solution, the current being 2 ma for fourteen minutes With this dosage the primary flush appeared at about seven minutes The relationship of the blood pressure to the dose of histamine and the onset of the flush is given in Table 3 Note that with increased dosage the flush begins earlier and the drop in blood pressure is, in general,

TABLE 2.—OSCILLOMETRIC INDEX (FOREARM) AND BLOOD PRESSURE AFTER HISTAMINE IONTOPHORESIS (1 PER CENT HISTAMINE)

more noticeable The oscillometric index was essentially unchanged The plan of initiating therapy prior to permitting home therapy is well brought out in Table 3, which should be consulted for details It is of importance that this patient took approximately 100 mg of niacin daily during the time of and simultaneously with her histamine therapy and that she was able to take two treatments per day without immediate untoward effects Shortly after beginning therapy, the patient seemed much better and was not as much fatigued on walking about She was able to use the subway and to go shopping alone She stated, "My legs don't jerk as much from the joints" Her vision was much improved, and she has been placed on home therapy

It might be argued that the improvement in this case may be due to factors other than those connected with the administration of histamine For example, niacin was taken simultaneously

TABLE 3.—BLOOD PRESSURE DOSAGE PLAN AND FLUSHES (CASE 3)*

* Patient received her own equipment on July 21

It was quite possible that this striking improvement was due to a synergism between histamine and niacin Dr R M Brickner, who referred this patient for therapy, informed the writer that in his opinion, it was not a spontaneous remission but was due to the pharmacologic action of the histamine Further data, of course, must be obtained, and the future history of the patient under this type of therapy must determine whether or not the therapeutic technic is responsible for the clinical results

Seven other cases are under study at this time All of these patients showed some type of significant improvement, not only connected with a general feeling of well-being during the course of therapy, which might be psychologic, but also in vision and in muscular coordination which is most likely connected with the pharmacologic action of the drug

Discussion

The reaction of the patient becomes more favorable as the dose of histamine is increased The present technic initiates therapy with a solution containing 1/4 per cent of histamine acid phosphate, with a current of 2 ma for ten minutes This is increased slowly to what appears to be, for the present, an optimal therapeutic level of 5 ma for fifteen minutes with a 1 per cent solution The relationship of increasing dosage to the more favorable therapeutic results leads the writer to believe that the therapeutic result is due to vasodilatation rather than to psychotherapy No more than two treatments per day with maximum dosage have been given Further investigations will probably lead to a technic of safely increasing the number of treatments per day The drop in blood pressure however, will probably be the limiting factor to the dose administered in a single treatment Our present policy is to give the patient at least ten office treatments before a galvanic machine is to be purchased by the patient who, with his family, learns the technic of iontophoresis for self-administration

The following memorandum is given to the patient beginning home therapy

DIRECTIONS TO PATIENTS FOR THE SELF ADMINISTRATION OF HISTAMINE IN THE THERAPY OF MULTIPLE SCLEROSIS

1 Attach the electrodes to the iontophoresis machine making certain that the red plug matches the red socket. This is the positive pole The negative pole is the inert reference electrode and can be placed anywhere on the body or as demonstrated to you in the doctor's office The positive pole may be placed on the anterior aspect of the forearm If you decide to use another location of your body, please come to the office so that your reaction to that site may be tested, since absorption varies in different parts of the body The rate of the absorption from the site must be predictable. For example if the histamine is administered in the thigh the absorption of the histamine will be accelerated.

2 Obtain a piece of canton flannel 12 inches long and 3 inches wide, and fold over as directed Have a sheet of aluminum foil ready for the positive pole of the galvanic machine.

3 Dissolve one gram of histamine acid phosphate (Ergamine Phosphate—Burroughs Wellcome) in 100 cc of distilled water If distilled water is not available tap water may be used temporarily Measure out 10 cc or approximately 2½ teaspoonfuls of this solution using a plastic measuring spoon, and spread uniformly on the dry canton flannel Keep the remaining solution in the refrigerator

4. Place the canton flannel wet with the solution on the anterior aspect of the forearm place the negative reference electrode on the designated place making certain that there are no cuts or pimples under the electrode area. If metal touches the skin or if there are cuts, bruises or pimples there will be a concentration of electricity in that area and an intense burn will be felt All jewelry should therefore, be removed. Otherwise, the reaction as you know is simply itching with slight irritation

5 After the electrodes are firmly in place make certain that the rheostat is down to zero and turn the current on Slowly increase the current. If burning occurs make certain that the electrodes are uniformly in contact with the skin and that there are no breaks in the skin Increase the current slowly to 5 milliamperes. This should not be exceeded before discussion with the doctor

6 Maintain this current for fifteen minutes or as otherwise directed.

7 If fainting occurs, an injection of ½ cc of epinephrine 1 1000 will instantly relieve the symptoms due to the histamine.

8 Keep the following record of each treatment
Name
Time beginning of treatment
Time, completion of treatment
Total time
Flush appeared after _____minutes
Current of_____milliamperes
General reaction after therapy (include occurrence of secondary flushes)

It is believed that prolonged iontophoretic therapy with histamine, combined with vasodilators by mouth (e g , niacin), provides a greatly simplified form of therapy with excellent therapeutic possibilities at the present time It may also prove effective in other degenerative diseases of the central nervous system.

Summary and Conclusions

Successful reports by Horton and his coworkers in the therapy of multiple sclerosis by the intravenous administration of histamine has led to a program of iontophoretic therapy with strong histamine solutions It had been shown previously that if histamine is introduced into the human skin by iontophoresis, histamine depots are formed Eleven patients with multiple sclerosis have been treated by iontophoresis of histamine with sufficiently concentrated solutions and sufficient current density to produce both primary flushes during therapy and, in some instances, secondary flushes some hours later The data indicate that histamine in the dose and form administered does not produce important changes in the oscillometric index in the arm but does produce a drop in the blood pressure, especially the diastolic pressure In general, therapy increases muscular coordination, muscular strength, and improvement of vision The advantages of the therapy proposed are (1) the veins need not be punctured over prolonged periods of time, (2) sterile equipment need not be employed, (3) it is readily administered at home, (4) it is inexpensive, (5) hospitalization is not necessary, and (6) it can probably replace intravenous therapy

On the basis of the data presented thus far, it is believed that prolonged iontophoretic therapy with histamine, possibly combined with vasodilators by mouth, provides a greatly simplified form of therapy with good therapeutic possibilities

For the past year 18 patients have been on home therapy following the procedure outlined above Four of these patients are wheelchair cases The period of home therapy has ranged from one to nine months In this series there have been no relapses One patient was treated with benefit at the beginning of a severe acute remission. The technic is now being applied in one case of Parkinson's disease

Jones in a paper presented at the fifth annual meeting of the American College of Allergists April 15 1949 reported that he has treated 60 cases of multiple sclerosis by histamine iontophoresis using the technic described in this paper Jones agrees with the advantages of the electrophoretic method as outlined here and finds that with histamine iontophoretic therapy there is a temporary increase in muscular coordination and strength which lasts longer with iontophoresis than with the intravenous method Twenty-five of his patients are being treated at home with 35 in the hospital as outpatients There were two of 62 who felt better under intravenous therapy

FRIEDLANDER BACILLUS PNEUMONIA TREATED WITH STREPTOMYCIN

ERWIN EDWARD BENZIER, M D , JACOB SCHWARTZ, M D , F A C P , and MAX A ELIAS, M D , Brooklyn, New York

(From the Medical Service of the Beth-El Hospital)

PNEUMONIA due to Klebsiella pneumoniae (Friedländer's bacillus) is a relatively rare condition According to Solomon, it comprises from 1 to 3 per cent of all pneumonias and occurs almost exclusively in the later decades of life [1] There is a considerable preponderance of males over females, and it almost never occurs in children In a series of 2,000 cases of pneumonia, Cecil, Baldwin, and Larsen found an 0 4 per cent incidence of pure infections with K pneumoniae [2]

Bacteremia is found in 70 per cent of cases according to Bullowa [3 4] Pure cultures of the Friedländer's bacillus are obtained from the sputum, from the lung juice, and frequently from the blood

Prior to the work of Heilman, the mortality rates in several series of cases varied between 80 and 100 per cent [1 3 4 5] The results of this study suggested that streptomycin might be useful in the treatment of infections caused by micro-organisms of the Friedländer group Since that time several cases of complete recovery in Friedländer pneumonia with the use of streptomycin have appeared in the literature Geier reported a case in which complete recovery resulted with the use of both streptomycin and sulfadiazine [6] Learner and Minnich's case recovered promptly with the use of streptomycin [7] Bishop and Rasmussen also reported a case of Klebsiella pneumonia treated with streptomycin [8] Final x-rays of the chest in all three cases showed complete resolution

The following case is reported to show a complete and rapid discovery from a Friedländer's pneumonia without any ensuing complications

Case Report

D H , a sixty-three-year-old white man, was admitted to the hospital on September 15, 1947, with a chief complaint of fever of two days duration, sweating, and a thin watery nasal discharge

The patient had been well and active until September 13, 1947, when he returned from work with a temperature of 102 F and profuse sweating but no chills The following day the above symptoms persisted, and, in addition, the patient developed a cough productive of a tenacious mucoid sputum which was not bloody

The past history was not remarkable except that the patient was adequately treated for syphilis in 1943 with arsenic and bismuth

Physical examination revealed a well-developed, well-nourished white male lying quietly in bed and sweating profusely Although he was lethargic, the patient responded quickly and accurately to questioning He was moderately dyspneic, but no cyanosis was noted The temperature was 104 6 F , pulse was of good quality with a regular rate of 110, respirations 26 per minute Blood pressure was 140/90 Eye, ear, nose, and throat examination revealed no significant abnormalities except for a thin watery discharge coming from the nose The pharynx was red and injected, but no exudate or ulceration was noted The tongue was dry and coated white There was no palpable lymphadenopathy The trachea was in midline The thorax was symmetric, and no splinting was noted Examination of the lungs revealed normal breath sounds throughout both lung fields Examination of the heart revealed no enlargement either to the right or left The sounds were regular, rapid, and of good quality No murmurs were audible The abdomen showed no palpable masses or enlargement. There were no deformities of the extremities Rectal examination revealed a smooth, normal prostate Neurologic examination was entirely negative

Laboratory data was as follows The urine on admission showed no abnormal findings The blood count revealed 4,100,000 red blood cells, 83 per cent hemoglobin, 7,250 white blood cells with 74 per cent polymorphonuclears, 25 per cent lymphocytes, and 1 per cent eosinophils

A diagnosis of acute respiratory disease was entertained at the time of admission

Roentgen examination taken on September 17 (two days after admission) showed no evidence of recent or active parenchymal infiltration or pleural involvement (Fig 1)

In view of the patient's toxicity and temperature, although physical and laboratory evidence did not reveal a pneumonic process at the time of admission, the patient was placed on penicillin, 50,000 units every three hours, on September 17 (two days after admission)

Beginning on September 18 (three days after admission), physical examination of the lungs revealed dullness at the right base with occasional fine crepitant rales at both bases A diagnosis of bronchopneumonia was entertained In addition to the penicillin, which the patient was receiving at this time, sulfadiazine 2 Gm initially and 1 Gm. every four hours with equal amounts of sodium bicarbonate was administered

On September 19 the patient had a severe chill and became cyanosed and dyspneic The pulse was thready The blood pressure was 80 systolic,

FIG 1 Roentgenogram showing no evidence of recent or active parenchymal infiltration or pleural involvement.

60 diastolic, pulse 110 and regular Examination of the chest at this time revealed dullness and fine crepitant rales in both lung fields, most marked at the bases The heart sounds were difficult to hear The patient was placed in an oxygen tent and 1 2 mg of digitoxin was administered A daily maintenance dose of 0 2 mg of digitoxin was given

On September 20, B Friedländer was grown from the sputum cultured on September 17 In addition, the blood culture was also reported as positive for B Friedländer Thus, the penicillin was discontinued, and streptomycin 1 Gm. initially and 0 25 Gm every four hours was given Within twenty-four hours the condition of the patient began to improve.

On September 23 the patient's temperature was normal He appeared clinically improved and was no longer lethargic, cyanosed, or dyspneic X-ray of the chest on this date revealed a diffuse proliferative infiltration throughout the pulmonic fields with the greatest involvement in the lower lobes (Fig 2) These findings were consistent with a diagnosis of bronchopneumonia Streptomycin was discontinued on September 25, and a blood culture taken September 23 was reported negative

The following day the temperature rose to 101 6 F Examination of the lungs revealed dullness and crepitant rales at both bases posteriorly Streptomycin therapy was again begun and continued until October 3, the temperature having been normal for four days All blood cultures after the first positive one were negative Radiographic examination of the chest on October 8 showed a pleural thickening at the left costophrenic angle, but there was no evidence of any parenchymal infiltration (Fig 3) The patient was discharged on October 9, 1947 At no time were any toxic manifestations to the streptomycin noted.

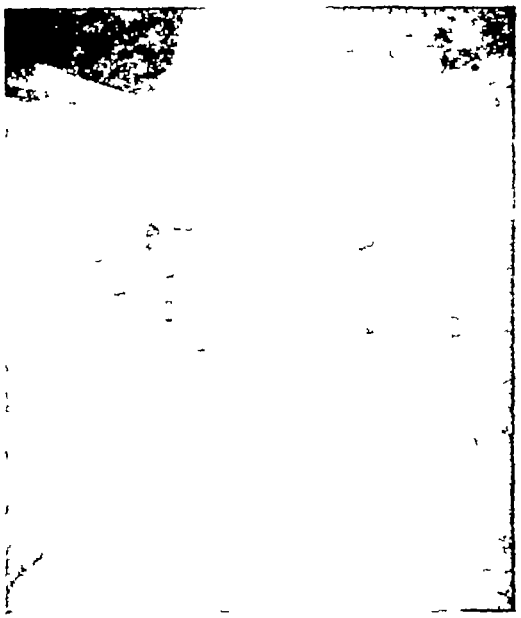

FIG 2 Bilateral proliferative infiltration of the lower lobes with areas of exudation extending upward toward the hilus Periphery of lungs relatively clear, diaphragms of normal height and contour, there is no evidence of pleural involvement

Discussion

Solomon in 1940 reported that acute Friedländer pneumonia terminates fatally within a relatively short time [1] The surviving patients may recover completely or pass into the chronic stage

The entire illness of Klebsiella pneumonia may be divided into two stages first the acute stage, where there ensues, in the majority of cases, an aputrid necrosis of the lung and, quite frequently, pleural effusion, either purulent or serous Second, if the patient survives, there occurs the stage of chronic pulmonary suppuration with one or more thin-walled abscesses, bronchiectasis, or fibrosis, or a combination of the processes which may persist indefinitely with exacerbations and remissions Because of the presence of cavities in the lung and the frequent upper lobe involvement, the chronic form of the disease is very commonly mistaken for tuberculosis

Death may occur at any point in the clinical course, but occasionally, if the lesion is not too extensive, there may be apparently complete resolution.[1] Baehr, Shwartzman and Greenspan noted in a series of 198 infections with Klebsiella pneumoniae only two cases of pneumonia in which clinical and bacteriologic evidence during life left no doubt that the B Friedländer was the primary focus of pulmonary infection They

FIG 3 Pleural thickening at the left costophrenic angle and no evidence of parenchymal infiltration

emphasized that in reporting cases of primary B Friedländer pneumonia it is important to exclude secondary invasions by this organism in cases of primary pneumococcus pneumonia, influenzal pneumonia, chronic bronchiectasis, lung abscesses, and tuberculous cavitations, and metastatic infections of the lung from a primary focus of B Friedländer infection within the abdomen [9] Solomon takes issue with the opinion expressed by Baehr and his coworkers that the Friedländer's bacillus is a secondary invader in pneumonia [10]

Since streptomycin is now available, the need for proper evaluation and bacteriologic study of sputum and blood is increased, in order that a diagnosis of Friedländer pneumonia be made early in the course of the disease By early diagnosis and prompt treatment with streptomycin, the common complications of acute Friedländer's pneumonia as listed by Solomon may be diminished or even prevented It should be emphasized that once tissue destruction has taken place, the results, even with streptomycin, are not favorable

Summary

1 The incidence of Friedländer's pneumonia, the incidence of bacteremia, and mortality rates prior to the advent of streptomycin are discussed

2 Cases of complete recovery from Friedländer's pneumonia with streptomycin found in the literature are cited

3 A case showing complete and rapid recovery from Friedländer bacillus pneumonia by early diagnosis and treatment with streptomycin is reported

4 The need for careful bacteriologic study of patients with acute respiratory disease is stressed so that early treatment with streptomycin may be instituted in cases of Friedländer pneumonia, in order to reduce the incidence of chronic cases resistant to treatment

U N CHILDREN'S FUND BEGINS ANTISYPHILIS DRIVE

A $2,000,000 campaign to combat syphilis and protect new-born infants from the disease is being undertaken by the United Nations International Children's Emergency Fund, it was announced recently

The fund's program is reported to be the first an tisyphilis program undertaken on an international scale

Allocations already have been made for disease-prevention projects in Bulgaria, Finland, Hungary, Poland, and Yugoslavia With money allocated by the fund's twenty-six nation executive board, antisyphilis campaigns will be carried out in these countries under the joint auspices of the fund and the United Nations World Health Organization

The first program to protect children and expectant mothers will be started in Poland with a $384,000 allocation An initial contribution of $225,750 has been set aside to begin an antisyphilis project in Yugoslavia Similar programs have been planned for Bulgaria, where 1,000 pregnant women and 3,900 children will be aided under a $51,000 grant, and Hungary, where $65,000 has been set aside to treat 5,250 mothers and 200 infants.

The Polish campaign, fund officials explained, will serve as a model for other countries, since plans already are under way to extend the programs to Italy and Czechoslovakia. The fund's executive board has recommended also that conditions be surveyed in Albania, Greece, Rumania, and China

SPA THERAPY IN DISEASES OF THE SKIN

EUGENE NEUWIRTH, M D , New York City

(From the Department of Physical Medicine, Mount Sinai Hospital, and the Arthritis Clinic, St Luke's Hospital)

NATURALLY occurring thermal and hot springs (mineral waters) have been used internally and externally for the treatment of systemic and local diseases since time immemorial In our country, however, the therapeutic potentialities of natural mineral waters and other natural spa media have never been fully appreciated, particularly with regard to cutaneous affections The importance of personal experience with health resort measures as employed in the treatment of dermatologic disorders was stressed in a recent article by Cipollaro [1] He points out that most American dermatologists, including himself, have had little personal experience with health resorts E Wohlstein and the author have found natural sulfur waters and natural sulfur mud very useful in the treatment of a number of dermatoses [2-5] This essay deals with our experience in this respect

In Europe, bathing in natural mineral waters and the employment of other spa media, such as mud, peat, and moors, are well developed and recognized procedures in the treatment of cutaneous diseases Spa care has proved therapeutically effective, especially in chronic and recurrent dermatologic disorders resistant to ordinary dermatologic measures It should, however, be emphasized that many recalcitrant, chronic, and recurrent cutaneous disorders which do not respond to usual dermatologic management, also fail to improve at a spa

Spa Benefits

The curative effects of natural spa media have been variously ascribed to spirits residing in the springs, to the chemical properties of dissolved minerals, to radioactivity, to thermal action, to the sweating process, and to psychic factors It is argued again and again that the curative value of natural mineral waters is in no way superior to that of artificially medicated or even ordinary water To date, however, all attempts with artificially medicated waters have failed to duplicate the benefits derived from the use of natural spa products The failure is not fully explained by the absence of trace elements in the artificially medicated substances [6]

Psychic influences undoubtedly play an important role in bringing about improvement in a patient's psyche and soma, but they are part and parcel of the many benefits which a stay at a spa offers life for a shorter or longer period of time under conditions wholly different from those at home, retreat from worries, anxiety, and the fast tempo of every day living, beauty of the scenery of the spa which is often situated in a picturesque valley, favorable climate, freedom from environmental pollens and dust, rest and relaxation, individually adjusted diets, outdoor exercises and sports in prescribed amounts, interesting excursions, entertainment, sitting in the "cure park" or on the "cure terrace" and listening to the "cure music" or to fellow sufferers who report improvement in their condition or in that of others, drinking mineral waters—all tend to enhance the dominating purpose of every spa, namely, getting well The will and determination on the part of everyone connected with the spa management, physicians, personnel and inhabitants, in every way to help the patient regain his health is of inestimable value The natural advantages of the spa, the spa regimen, and the spa measures together bring about notable improvement in the general health—the physical, mental and emotional states of the patient These factors substantially aid the recovery of cutaneous diseases of patients with psychoneurotic backgrounds, as of idiopathic generalized pruritus, prurigo, lichen planus, and urticaria chronica

Classification of Spa Waters

Spa waters exert a stimulating or a soothing influence upon the body Sulfur spa waters exert a stimulating action. In general, however, spa waters are classified on a chemical basis, according to the predominance of one or the other cation or anion In sulfur or sulfuretted waters, the sulfides, thiosulfates and sulfates of sodium, calcium, and magnesium predominate Sulfuretted waters are charged with hydrogen sulfide gas Other spa waters are sulfate or earthy waters, alkaline and alkaline-saline waters, and waters which contain iron, arsenic or iodine

Percutaneous Absorption.—Generally speaking, electrolytes in an aqueous solution do not penetrate the intact skin of mammals The skin is impermeable to salts containing physiologic (sodium calcium) or nonphysiologic cations (lithium, rubidium, strontium) [7] Some anions, however, seem to penetrate the skin. Iodine has been recovered from the urine after iodide solutions were applied to the skin Lipoid soluble substances, such as hydrogen sulfide, penetrate unbroken skin A certain degree of solubility of substances in water together with high lipoid

solubility represent the optimum for transepidermal absorption [7] The absorption barrier is in the transitory layers between the cornified and noncornified epithelium Breaks in the epidermal barrier such as are caused by cutaneous lesions permit the absorption of substances which otherwise would not penetrate the skin

Sweating Process.—Through spa measures, heat is imparted to the body by conduction while loss of heat is prevented This results in a rise in the body temperature and a speeding up of general metabolism To bring about heat loss, copious sweating is induced with subsequent evaporation of the water from uncovered areas of body surface High moisture content of the environment impedes evaporation of the sweat and thus helps to check heat loss

Patients as well as many physicians have always attached therapeutic value to profuse sweating It is asserted that "poisons," notably "acid" substances, especially lactic acid, are eliminated in increased amounts in the sweat In this connection, the alleged value of sweating in nephritis may be recalled

Along with increased sweating, water vapor and carbon dioxide escape through the overventilated lungs The ingestion of large quantities of mineral water promotes elimination through the urine and the bowels

Internal Administration.—The sulfur spa water may also be administered by mouth Sulfur mineral water often exerts a mild laxative effect The physiologic action of the mineral water of the springs ingested at the source is partly due to the water as such and partly to the ionic dissociation of the molecules of the mineral compounds present in the water (ionic therapy)

Bathing, in conjunction with drinking spa water, hastens the elimination of drugs used for internal and external dermatologic treatment Sulfur spas have long been known to be effective in ridding the body of drugs such as mercury, bismuth, arsenic, and gold In former times, patients afflicted with syphilis were often referred to sulfur water spas to carry out mercury rubs Patients with rheumatoid arthritis seem to tolerate injections of gold salts much better when undergoing simultaneously treatment at spas with sulfur water

The author administered sulfur spring water also by intravenous and intramuscular injection for nonspecific desensitization

Mineral Muds

Mineral muds are well suited for packs as they usually are of a buttery consistency and have a high degree of plasticity, low specific heat, poor heat conductivity, and high specific gravity Part of the therapeutic action of most muds can be attributed to their content of microsco of quartz, diatoms, coccoliths, needles, and t like, which produce hyperemia of the skin b mechanical stimulation Among the chemic substances contained in muds, the sulfur co pounds deserve special mention The presen of lipoid soluble sulfur compounds, such hydrogen sulfide, is important, for these co pounds are able to pass through the unbroke skin The sulfur acts both as a nonspecif stimulant and as a chemical for indicated sulfu therapy

Technic.—Mud is applied in the form o baths or packs The temperature of the mu baths ranges from 100 to 106 F or higher Mu as well as peat can be given at higher tempera tures than water because the point of therma indifference for these products is higher Becaus full as well as three-quarter mud baths are apt to cause exhaustion, the application of mud in the form of general or partial packs is the method of choice in the treatment of diseases of the skin. This involves the following procedure the whole or parts of the body are covered with four-inch thick layers of hot mud, then wrapped in oil cloth, white sheeting and woolen blankets Mud packs are usually followed by a bath in the sulfur spa water after which a dry pack is applied, i e, the patient is wrapped in a hot sheet and a woolen blanket Massage, consisting of rubbing and kneading, of the whole body is the next step This is followed by topical medication The skin surface being cleared of scales, fatty material, and debris, and the glandular and follicular pores being freed of greasy scales permits closer contact of topical medications with the diseased skin, whereby transepidermal absorption of lipoid soluble substances through the appendages is promoted

Rest in bed for at least two hours concludes the treatment This procedure is repeated three to five times a week.

The temperature of the mud used for packs is 110 to 126 F, that of the sulfur water ranges between 100 to 104 F The separate stages of treatment (full or partial mud bath, or general or partial mud pack, thermal bath, and dry pack) last on the average from fifteen to twenty-five minutes, depending mainly upon the temperature of the spa media The factors which determine the temperature and the duration of the spa procedures are the nature of the cutaneous disorder, the extent of skin area to be treated, the general health, appearance, and age of the patient, and the condition of the heart and blood vessels

Mud Pool Baths.—The mud pool is a large pool, the bottom of which is covered with hot mud (knee deep) into which hot sulfur springs discharge The water in the pool is shoulder high

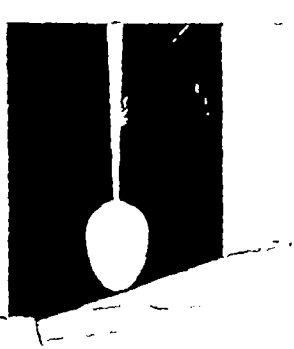
designed for the  *young*

cillin 100-Sulfas' (penicillin and the sulfonamides) has been found
atically effective in treating many of the common bacterial infections
ildhood It is particularly indicated in the following

Pneumonia
Acute Sinusitis
Upper Respiratory (and related) Infections

purulent rhinitis	bronchitis
nasal pharyngitis	tonsillitis
streptococcal sore throat	otitis media

Bacillary Dysentery
Urinary Tract Infections



cillin 100-Sulfas' is so pleasant tasting and easy to swallow
children enjoy taking whatever amount you prescribe
teaspoonful (5 cc) supplies crystalline potassium penicillin G
000 Units), sulfadiazine (0 167 Gm), sulfamerazine (0 167 Gm),
methazine (0 167 Gm) Available in 2 fl oz bottles

Mud Pool Baths—The mud pool is a large pool, the bottom of which is covered with hot mud (knee deep) into which hot sulfur springs discharge The water in the pool is shoulder high

The temperature of the mud pool bath is about to 106 F When the patients move about r stir up the mud causing it to mix with the er to form a suspension The duration of e baths ranges from twelve to fifteen minutes ess The other steps involved in this pro- ire include dry pack, massage, local applica- of the drug to be used, and bed rest

ictions

he body responds to the application of hot products to the skin with local, focal, and emic reactions The local reactions are char- erized by vasodilatation and increased flow of od at the site of application, evidenced by in- e local erythema The flow of lymph and pedesis of leukocytes are heightened These cesses increase tissue metabolism and quicken ie respiration, and supply oxygen and nutri- t in amounts necessary for meeting the needs he tissues The physiologic effects produced he action of spa products applied to the skin note resorption of the products generated by pathologic process involving the skin, en- ce resolution, and stimulate tissue repair requently, within twenty-four hours after spa atment, the cutaneous lesion exhibits a de- ed reaction which is manifested by an intensi- ation of the symptoms and signs This is own as focal reaction.

The heat applied to the cutaneous surface is ned inward with consequent rise in body tem- rature, and enhancement of general circulation d metabolism It is claimed that thermal, emical, and mechanical stimuli as embodied in a measures effect the release of histamine or stamine-like substances with consequent vaso- latation and cutaneous erythema [8] Part of the influence of the substances seems to be exerted brough the autonomic nervous system and the ndocrine glands The influence of spa measures n the endocrine glands through the mediation of he skin and the autonomic nervous system be- omes apparent in the systemic reaction ("cure eaction," "cure crisis") The systemic reaction xhibits symptoms and signs similar to those of rotein shock therapy

Undesirable Effects

Not to be confused with systemic reaction is he "cure exhaustion" (thermal debility) Lassi- ude and general malaise are caused by too fre- uent and too prolonged bathing in spa media hat are too hot

Mention should also be made of the dermatitis which occasionally develops as a result of contact with sulfur spa water and sulfur mud The skin becomes dry, red, and desquamates, vesicles may also form. The cutaneous manifestations quickly regress when bathing is omitted, they may recur in patients with very sensitive skins The type of contact dermatitis due to spa media varies with the spa

Profuse sweating may cause miliaria

Types of Dermatoses Benefited by Spa Therapy

The various members of the eczema group are often favorably influenced by spa treatment Marked benefit may be obtained by patients afflicted with widespread or localized types of neurodermatitis, and by patients with contact dermatitis (dermatitis venenata) The eczema- toid condition secondary to intense pruritus and scratching in the anal and pudendal regions characterized by redness, infiltration, thickening, induration, and weeping frequently responds to spa measures, especially in combination with colonic irrigations and vaginal douches with natural sulfur water However, one should al- ways search for underlying etiologic factors Acute or subacute eczematous eruptions do not benefit from spa therapy

The cutaneous manifestations complicating varicose ulcers and the ulcers themselves, par- ticularly the sclerotic and torpid ones, are often successfully managed by bathing in the hot sulfur springs and by the use of mud, massage, and rest In obstinate decubital and x-ray ulcers, epithe- lialization is greatly enhanced by mud packs Lymphedema with hypertrophy of the skin and subcutaneous tissues affecting the extremities are satisfactorily improved by mud packs, thermal baths, massage, and rest

Recent chilblains and congelations, even of mild severity, fail to respond to spa treatment, but old and severe cases of dermatitis congelationis are definitely improved Such treatments have been carried out successfully in desperate cases where dermatologic measures have failed

Raynaud's disease and erythromelalgia are also amenable to spa measures In a case of Von Recklinghausen's disease (neurofibromatosis) with painful tumors, the sensation of pain vanished with spa therapy and the tumors be- came soft Patients with neuralgic sequelae after herpes zoster as well as patients with cutaneous manifestations produced by injuries to peripheral nerves causing burning pain (causalgia) are fre- quently referred for the application of mud packs

In many cases of psoriasis, spa measures are employed to advantage Generalized and even universal eruptions may clear up after treatments with mud On the other hand, cases with a few erythematous and scaly patches may prove to be unresponsive to spa therapy About 1 per cent of patients suffering with psoriasis also have

THE CLINICAL IMPORT OF BLOOD CHOLINESTERASE DETERMINATIONS IN CHOLINERGIC EPISODES AND STATES IN THE HUMAN

CYRIL SOLOMON, M D , ROBERT D BARNARD, M D , and HARRY G GOLAN, M D ,
Hollis, New York

(From the Terrace Heights Hospital)

THE discovery of adrenalin was followed by the exhaustive work of Cannon which purported to show that this hormone was the chemical mediator of the thoracolumbar autonomic nervous system.[1] The theory was utilized by experimental physiologist and clinician alike and had a large part in the therapeutic development of adrenalin and other sympathomimetic amines Less spectacular but of equal importance was the hypothesis of Dale that the parasympathetic autonomics and the somatic nervous system were mediated by the liberation of a muscarine-like substance at synaptic and myoneural junctions [2] This hypothesis was vindicated when Loewi demonstrated that stimulation of the vagus was followed by the appearance of acetylcholine (ACh) within the heart muscle [3] The classic "vagal" heart slowing was apparently due to liberation of ACh. The latter could be demonstrated if the blood of the animal whose vagus was stimulated was passed through another animal by cross circulation. The heart of the second animal would slow on stimulation of the vagus of the first This particular nerve action, therefore, had a "humoral" or "hormonal" basis Similar circumstances were soon shown to exist at all synaptic and myoneural junctions

Since nerve action is rapid and evanescent, whereas humoral activity is usually sustained, an explanation of the unprotracted response on vagus stimulation had to be forthcoming Loewi found within the heart muscle an enzyme capable of inactivating ACh The same or a similar enzyme was also found in practically all tissues, and it was decided that the presence of this enzyme was a necessity, otherwise stimulation of a nerve, releasing ACh, would cause an effector response sustained long after its period of physiologic utility It might even result in acetylcholine poisoning, since the latter substance is diffusible and could obviously be carried by the blood stream (as in the above experiment) away from its site of formation

Naturally enough, the highest concentration of this enzyme (which hydrolyzed the ester linkage in ACh and was, therefore, termed "cholinesterase" and represented by the symbol, ChE) was found in nerve tissue, but it was also found to be present in appreciable and constant concentration in such a typically non-nervous tissue as the blood A great many of the investigations were restricted to serum ChE concentration determinations alone, whereas the bulk of the blood ChE in the human is erythrocytic [4] For that reason, significant variations in the concentration of the whole blood enzyme (which represents the true potential of this fluid as a systemic ACh neutralizer) were overlooked Because the serum and erythrocyte ChE ratios frequently alter without absolute total variation, wide fluctuations in the serum ChE concentrations did not permit conclusion as to their significance Milhorat was able to show a parallelism between serum ChE depression and clinical severity of certain conditions, Antopol and his coworkers found an increase in hyperthyroidism and a decrease in anemias and debilitated states, and ChE determinations in serum were considered to be of diagnostic value in barbiturate addiction, jaundice, and hepatic cirrhosis [5–8] Serum ChE lowering was also found in eclampsia, and here again diagnostic and prognostic significance has been stressed [9–11] Low serum ChE values were encountered in nephropathies and hepatopathies On the latter basis, a hepatic origin of serum ChE has been assumed

Serum ChE variations in health and disease have also been reported by other investigators, among which Faber and Cruxatto and Hurdobro, while admitting marked variation from the average in various diseases, discount any diagnostic significance to the figures [12–16]

Reports on whole blood cholinesterase figures lead to other conclusions Figures for whole blood ChE, while still sparse, are nevertheless sufficient to indicate a remarkable constancy for any individual during health, a fair constancy between healthy individuals, and definite patterns of departure from the average in disease The pioneer work of Sabine in which the partition of whole blood ChE between serum and erythrocytes was measured—a classic apparently overlooked until attention was again focused on it by the more recent work of Davis and that of the author's group—showed that blood ChE values were somewhat elevated in the hypochromic or "secondary" anemias, whereas in pernicious anemia they were lowered, rising during remission [17–20] Sabine concluded that the elaboration of blood ChE was a bone marrow function Measurement of both serum and erythrocytic ChE fractions by Weber confirmed the reported

arthritis (arthropathic psoriasis) The arthritis is usually of the rheumatoid type and effects most severely the terminal interphalangeal joints, especially those of the toes Exacerbations and remissions of the skin lesions run parallel with the articular symptoms and signs To secure best therapeutic results, in addition to spa measures, other physical agents such as natural sunshine or quartz light as well as internal drugs and topical applications are employed

Patients with exfoliative dermatitis may experience slight to moderate relief from itching and chilliness and may notice objective improvement through spa measures In a case that followed psoriasis and where the eruption was universal, mud treatments brought about a remarkable improvement after six weeks Following the employment of mud, sulfur petrolatum (10 per cent) was applied to the skin Wohlstein successfully treated by means of mud packs a case of pityriasis rubra (Hebra) that was previously managed by Unna with ink baths and adrenalin ointments

Two cases of pityriasis rubra pilaris were unaffected by spa treatments Cases of chronic lichen planus with generalized or localized eruptions usually derive benefit from spa therapy In a case of pityriasis lichenoides chronica (Parapsoriasis guttata) the therapeutic result was excellent In ichthyosis, spa care softens the skin and diminishes scaling

The use of hot mud packs for the deep-seated nodes of acne indurata and also for the lesions of acne conglobata may accomplish good results In cases of chronic furunculosis, favorable and unfavorable results are obtained with spa measures Packs with hot sulfur mud help to accelerate the involution of the nodular manifestations of sycosis vulgaris and tinea barbae Treatment with mud packs hastens regression of rheumatic nodules

Various forms of cutaneous tuberculosis, particularly papulonecrotic tuberculids, scrofuloderma and erythema induratum (Bazin) are favorably influenced through spa care Wohlstein employed mud in cases of rosacea, ulerythema ophryogens, and in lupus erythematodes

Summary and Conclusions

1 The role of spa therapy in diseases of the skin is discussed

2 Therapeutic spa measures are outlined

3 There is no routine spa treatment Treatment must be individualized for each patient

4 Spa care takes the patient away from the dreary, everyday chores and sets him in a new environment with a hope of a "cure" The spa per se, the scientifically regulated regimen, and the spa measures combine to establish optimal general health

5 Sulfur spring waters and sulfur mud act as stimulating agents in a number of chronic, stubborn diseases of the skin which fail to respond to ordinary dermatologic care

6 The United States abounds in mineral springs and other natural products at spas possessing facilities for their use in diseases of the skin to make it unnecessary to go to foreign resorts *

7 Spa care should be looked upon as a valuable supplement to the recognized therapeutic armamentarium of dermatologists practicing at a spa

8 Spa therapy is an established component part of physical dermatotherapy

123 East 84th Street

* In 1930 approximately 100 000 Americans were treated at European spas †

I wish to acknowledge my deep appreciation to Dr V H. Mendelsohn who read the manuscript and gave valuable aid to the author

A M A EDITORIAL CONDONES SHOE-FITTING FLUOROSCOPES

The x-ray fluoroscope machine used in many shoe stores "simply cannot be really safe in the hands of those untrained to its use and relatively ignorant of its dangers," says an editorial in the April 9 issue of the *Journal of the American Medical Association*

ChE in the human.[40-42] There is thus an explanation for the efficacy of certain cholinergics as "desensitizers" to cholinergic episodes, although such "desensitization" is nonspecific in the allergy sense. Again the term "atopy" is preferable.

3 Fibrillary-pyrexial-tetanic reactions are composed of the classic rigor, chills, and fever symptoms The somatomotor phase may vary from fibrillary twitchings to the coarse spasms of tetany, the last, however, being readily distinguishable from the clonus of the epileptoid phase of syncope Here, again, the reactivity to typhoid vaccine is purely nonspecific, the same type of reactor evincing a fibrillary pyrexial response to any cholinergic stimulus whatever, whether this be of the nature of infection, metabolic disturbance, or emotional stress

Any cholinergic stimulus or group of stimuli can additively summate to produce a cholinergic reaction, and the latter is liable to manifest itself in any single one or any combination of the reactions described The ultimate form of a cholinergic reaction or state will depend more on the constitutional predisposition of the reactor than the specific nature of the cholinergic episode or stimulus inducing the reaction Thus, emotional stress, infection, the administration of ACh or histamine or essential estrapenia will produce one set of symptoms in one individual and an entirely different train of manifestations in another It also follows logically that there may be a group of individuals in whom estrapenia or the imposition of cholinergic stimuli will produce no manifest reaction whatever

Malignant Estrapenia and the Blood Dyscrasias

Sabine demonstrated the primary role of the bone marrow in the elaboration and maintenance of the blood ChE In the malignant hematologic dyscrasias are found the most profound systemic evidences of cholinergic intoxication.[26]

In support of Sabine's theory, those anemias characterized by actively regenerative marrows, as well as polycythemic bloods, yield high ChE values.[17] Following blood donation and a transient fall in ChE, there is a sharp compensatory rise which, after a few days, carries the blood ChE above its predonation level.[25]

In macrocytic anemias, whether of the Addisonian or nutritional type, or in the anemias associated with subacute bacterial endocarditis, polyarteritis nodosum, glomerulonephritis, or generalized malignancy, the ChE values are low, indicating the actual hypoplastic nature of these anemias However, it is in the malignant hematologic dyscrasias that the extremely low values are found In one of our cases of acute leukoblastosis, it was the lowest value ever recorded—1 28 unit per cc.[43] This lowering specifies that in the malignant dyscrasias we are dealing primarily with a bone marrow depression and not the reverse Liver extract or folic acid is not converted to ChE by the leukotic marrow The situation in the malignant dyscrasias is different from that of pernicious anemia where the ability for this conversion exists Hence, in the acute leukemias, as in the other malignant dyscrasias (granulopenia, irradiation purpura, aplastic anemia, thrombopenia, lymphosarcoma, endotheliolymphogranulomatosis), our attempts at rational therapy are restricted to such measures as will elevate the blood ChE substitutively Unfortunately, although we may be dealing with potentially remittable conditions, we have as yet no effective method of raising the blood ChE directly Blood transfusion has a limited effect, massive plasma infusion appears to be somewhat better Urethane, barbital, alpha-tocopherol, and ascorbic acid each have a slight in vitro activating effect on the blood ChE, and their use would, therefore, appear to be indicated.[44-46] Purified ChE preparations are due for trial

It is in the differentiation of the malignant from the benign hematologic dyscrasias that the diagnostic value of the blood ChE determination resides.[43] In the benign systemic lymphoses ("infectious mononucleosis" and reactive lymphadenomatosis), these values are normal, or even somewhat elevated, particularly in the longstanding conditions Some of the values appear to be in the atopic range

Miscellaneous Cholinergic Conditions

The blood ChE level is not the sole determinant of the presence or absence of a cholinergic state There exists a variety of conditions in which a cholinergic basis can be incriminated but in which estrapenia is not a feature In the few cases of chronic ulcerative colitis in which blood values have been obtained, there appear to be the somewhat elevated values (and not infrequently a similar morphologic blood picture seen in "infectious mononucleosis") Both conditions are frequently precipitated or aggravated by a cholinergic stimulus Blood ChE is definitely lowered in arthritis deformans, markedly so in the case of Felty's syndrome analyzed by Nigro and Barnard who reached the conclusion that this syndrome was an atopic-exudative form of cholinergic state.[47] Barnard and Sprinz found the mechanism of death in acute leukoblastic leukemia to be identical with that of either peptone or anaphylactic shock in its entirety, including the terminal outpouring of heparin into the blood.[25,48]

Irradiation death appears to have a similar mechanism Any penetrating radiant energy depresses the marrow and leads to a sharp drop in blood ChE Atopic phenomena appear, and

rise in the former in the chronic allergies and showed the whole blood ChE to be elevated in the latter [21-24] This is denied by Alles and Hawes [25] Berger reported an increase both of blood ACh and ChE in "functional disturbances of the autonomic nervous system "[26]

We must accept the verity of the suggestion, inherent in many reports that, in the human, occasional or even frequent ACh "flooding" from the nervous system does occur—that, as Alexander has pointed out, the human is a "cholinergic" animal [27-29] It is believed that, because of the large relative size of the nervous system of the human, this system may act, in effect, as a massive endocrine organ for the elaboration of systemically escaping cholinergic substance A special mechanism has to be extant to cope with the cholinergic "seepage," and, presumably, for this reason the blood ChE is higher in man than in any other mammal [4]

Blood Donor Syncope and Related "Shock" States

The importance of ACh "flooding" became evident during the war with close medical observation of the three forms of cholinergic response syncope of blood donors, typhoid vaccine reactions, and the shock responses

During the war, several million healthy subjects made blood donations Seven per cent developed a syncope syndrome (weakness or actual fainting, pallor, hypotension, hypothermia, and hyperdrosis) One out of 100 of this 7 per cent had an epileptoid or tetany phase, or both, accompanying or complicating the syncope syndrome The syncope was frequently protracted into a condition indistinguishable from surgical shock, and occasionally there was precipitation of a coronary occlusion.[30]

The marked similarity of blood donor syncope to "primary" or "neurogenic" shock was arresting and repeatedly noted [31 32] Blood donor syncope also duplicates the syndrome produced by intravenous injection of ACh, provided the subject has the same well-defined set of physical and psychologic stigmata that characterizes the individual who faints either in anticipation of, during, or following blood donation [33] Such subjects have a diminished skin vascularity and a well-developed panniculus adiposus (even the absence of any degree of obesity) [34] The blood ChE is within normal limits but may be lower than the average [35] The response to the endogenous ACh is unique in this type of reactor

When the total blood ChE is lowered by bleeding (moderately by withdrawal of a pint, markedly by loss of a quart), the circulating ACh in these subjects, causes vagal cardiac inhibition [17 36] This is one of the muscarinic effects of ACh By nicotinic effect, there is marked constriction of the skin capillary bed (hence the pallor), capillary arteriovenous dissociation, mild "forward" cardiac failure, and syncope [34] Thus the blood donor syncope syndrome is an example of a *cholinergic reaction* Blood donation or its anticipation leading to such a reaction is a *cholinergic episode*

Typhoid Vaccine Reactors and Atopic Cholinergic Reactions

Because of current interest in shock states and the apparent relationship of blood donor syncope thereto, another class of syncope reactors, those from typhoid vaccine administration, was investigated [37] Within a one- to two-day interval following the administration of the second dose of the Rawlings strain typhoid vaccine used by the Army, some of the subjects had a syncope reaction similar to blood donor syncope In a similar percentage the syncope reaction was accompanied or complicated by an epileptoid phase. Further inquiry revealed that other subjects undergoing typhoid immunizations would exhibit different reactions There was, however, in all reactions, a common nosologic feature in that such reactions occurred only during a certain interval following the second dose of vaccine and in individuals of certain definitive body type

Reactions to typhoid vaccine could be classified, along with the reactors, into three major categories, epileptoid-syncope, atopic-exudative, and fibrillary-pyrexial-tetanic

1 Epileptoid-syncope reactions and reactors have been described under the heading of blood donor syncope

2 Atopic-exudative reactions are apparently allergic or anaphylactic in nature and may be divided into two subtypes

(*a*) Visceral atopic—usually manifested by an attack of bronchial asthma, sternutation with conjunctivitis and rhinorrhea, and/or gastrointestinal hypermotility

(*b*) Cutaneous atopic—usually urticarial but occasionally petechial or frankly purpuric

Blood ChE studies have not given much information on the underlying mechanism of the acute atopic attacks Much of the published evidence is contradictory [21-25] Histamine is a cholinergic drug, and anaphylaxis in animals is accompanied by estrapenia [38 39] However, in the instance of cholinergic reactions, it is dangerous to draw conclusions for the human on the basis of animal experiments, since humans are probably unique in their reactions to cholinergic stimuli

Following repeated sensitizations, in the chronic allergies, or after prolonged administration of cholinergics (acetylcholine, histamine, insulin), there is protracted elevation of blood

ELUSIVE MENTAL CASES

Indecision

B Liber, M D , F A P A , New York City

(From the Mental Hygiene Clinic, New York Polyclinic Hospital)

IT IS normal for anyone to be in doubt about what to do, to be uncertain of the best way out of a difficulty, or to take a resolution and not abide by it Some degree of instability or lack of persistency cannot be regarded as abnormal However, as in all human actions, the problem, the tendency to abnormality, begins when there is an excess Doubt, hesitation, indecision, and uncertainty are abnormal when they are exaggerated or excessive

It is not abnormal to make doubly sure that the match has been completely extinguished before throwing it away, that the lights are out and the doors locked before leaving the house Some of us may be more attentive to such details than others However, to peer into the utter darkness to see whether there is still some light left or to keep pacing back and forth to and from the house without ever being convinced is an obsession If one goes further yet and cannot depart for fear that he is overlooking something important and, at the same time, is aware of his abnormality or exaggeration and deeply unhappy about it, then we have a mental disorder—doubting insanity

It stands to reason that whenever we are willing or whenever we wish to do something, we ask no questions, we raise no objections We do it But when we interpose some doubts, some inhibitions, when we connect the action with as many unpleasant feelings as we can, we make it hard or impossible to act If our doubts are of a grave nature and, try as we may, they fail to disappear, and if, on the other hand, the original desire or duty to perform the act persists, an inner clash or conflict arises, the problem remains unsolved, and we suffer

Uncertainty and doubt are akin to obsession and compulsion, but instead of forcing a patient to make some senseless motions, they interfere with his doing what he considers necessary Just as there are positive or active compulsions and obsessions, so there are negative or passive ones

These situations, if viewed from a group or social viewpoint, correspond to the positive and negative taboos in primitive society and, among civilized people, to the positive and negative superstitions which have developed into a good many religious commands and prohibitions (*Gebot* and *Verbot* as the Germans would say, or in a somewhat different sense the *saase* and *loh saase* deeds of the Hebrews) None of the tribes, groups, or individuals who obey such rules are abnormal, nor are they regarded as such, although they are imbued, knowingly or unknowingly, with thoughts and duties related to obsession and compulsion, and, while they betray no uncertainty now, originally they showed more than one tendency

The following examples, notwithstanding their monotonous character, are illustrations of some of the most frequent forms of the doubting mania as it is presented first in medical offices and eventually in psychiatric practice Of course, there is always a motive behind this lack of decision, whether we discover it or not

Case Reports

Case 1—A woman with an overwhelmingly large fibroid uterine tumor had been advised to have it removed and had hesitated for years She had heard that the menopause caused such growths to "shrink." Although she was also told that this was an impossibility when the size was so extensive, she insisted in carrying her now greatly protruding abdomen At last a psychiatrist, to whom she was sent and who made her tell her life story, discovered the why of her annoyance This childless female, in her yearning for an offspring, was reluctant to do away with something that resembled a pregnancy At the same time, she correctly guessed that a hysterectomy, which she knew was inevitable in an operation of this kind, would result in sterility That her gradually developing growth may have been the reason for her sterile condition all through her married life, she did not realize All through those years she was decent in every respect, well adjusted and with outwardly normal behavior She was a model housewife, had no trouble with her husband, and was highly esteemed by her acquaintances No one in her family, none of her friends or doctors, except the one who contacted the psychiatrist, suspected any mental aberration She finally agreed to the operation—and the true complication began thereafter Now she regretted having submitted to it She doubted its necessity She had heard of a woman conceiving, notwithstanding the presence of a tumor She felt that all her hopes were shattered forever She even threatened the surgeon with a law suit

Just then she was persuaded to adopt a baby, which she did, only to restore it within a short while to the institution whence it came No sooner had she done that than she reconsidered this decision

death is due to thrombocytopenic purpura Radiation leukemia has the same explanation as the "spontaneous" acute type, an attempt at compensatory overactivity of the marrow which fails in anything but the elaboration of undifferentiated leukocytes It is possible that blood ChE determinations will replace the less exact morphologic checks now used as a safety measure in x-ray, radium, and nuclear physics technicians

In the evaluation of blood ChE determinations, it is important to bear in mind that, as determined in the blood-donor survey, only 7 per cent of individuals react to estrapenia by manifest cholinergic phenomena If the recent studies on di-isopropyfleurophosfate in humans had not been limited to just a few individuals, some "cholinergic" reactors in that series would have been uncovered, and the results in such individuals might be tragic Whereas 7 per cent makes up a small percentage of the population, this group variously known as "vagotonic" or "asthenic" makes up a much higher percentage in the morbidity bracket

Rheumatic fever and the benign systemic lymphoses are examples of possible atopic conditions in which a normal or elevated blood ChE is extant As Lichtwitz points out in regard to rheumatic fever, it is "not caused by a specific micro-organism—but by a sensitization to antigens—in most cases products of micro-organisms [which] may be pathogenic or nonpathogenic Such sensitization might also arise in response to foreign proteins that are not of microbic origin"[49] Antigens such as pneumococcus toxin and even peptones are strongly antiesterase [50–52] Among the list that could be added to Lichtwitz's sensitization substances are those cholinergics which may be produced endogenously choline, iminazolyl, and guanidyl derivatives The prolonged administration of systemic elaboration of any cholinergic will stimulate the compensatory overproduction of ChE in those individuals with a functioning bone marrow Whether cholinergic phenomena still persist because of the inadequacy or insufficiency of this compensation is not as yet known

In no instance need they be specific, and it is possible that the clinical dissidence is due to individual constitutional reactivity Paralleling the individual's peculiar humoral response to a cholinergic episode, there is probably some degree of variability in the tissue response as well Thus, the possible existence of "lymphoid" or "endothelial" types of constitutional reactors is predicated [53] This interesting phase of the varied morphologic response of cholinergic episodes awaits further investigation

Summary

The role of blood cholinesterase studies in the elucidation of the mechanism of cholinergic episodes, reactions, and states in man is outlined Such determinations have been of particular importance in the adjudication of action of cholinergic endogenous substances and of specific diagnostic value in the differentiation of the malignant from the benign hematologic dyscrasias

the more spacious sleeping rooms" of the second apartment The husband said, almost seriously, that he "was so sick and tired of her, he would let her have both apartments" He cited instances about her similar behavior in other circumstances

A moment came when she did not dare ask for a reversal She was criticized pitilessly by her family and even if she wanted to she could make no decision, because she saw advantages and disadvantages in both places

In this case and in the matter of rooms, the analysis failed to disclose the precise mental mechanism of the unsolved doubt, but it seemed to have something to do with the sleeping accommodations for her and her husband, which she had hoped to change with a new apartment Apparently her disillusionment came when she found out that no desirable arrangement of the sleeping rooms, either in one or in the other apartment, was possible

Case 5—A woman, while extremely anxious to please her husband, also suffered from jealousy Although she found it necessary to accompany him wherever he went, she turned down his invitation to go with him on a business trip by ocean to South America A year later, after much insistence on his part, she accepted, but refused at the last minute, so that her boat ticket had to be returned to the company's office He departed without her, and then she felt miserable and spent a few months in sadness and regret

The next time he traveled abroad she followed him, but, in spite of a fine, smooth sailing, she was "awfully afraid of the water, trembled during the passage both going and coming, was tense, expected a shipwreck every minute, and was relieved only when touching ground in an American port" The third year she let him sail alone, and the time spent without him was a torture

When questioned in detail, she attributed her "fear" of the water to an incident that occurred in her girlhood, when a boy, a school colleague, was drowned in a lake in her presence Another element was combined in this distant event From the emotional appearance of her face and from her entire behavior while telling the story, it was evident that the young friend had meant more to her than a fellow student, although her true sentiments toward him were still unknown to her, or rather hidden from her by a subconscious purposeful effort There was the—perhaps hopeful—possibility of a shipwreck and of a drowning of her companion, which, naturally, she would hate to witness

Her "fear" was not an obstacle to such an interpretation It really amounted to a "fear-fulfillment" and was created, as it always is in such cases, by the subconsciously submerged "censor" That she did not love her husband, who had replaced in her life somebody dearer to her, would be clear to anyone who understands the significance of her jealousy To make matters worse, he, although quite fond of her, happened not to be a demonstrative type or to show his affections constantly For example, not given to much talking, he read a newspaper in her presence whenever they happened to be together

He too came to the psychiatrist and was advised to pay more attention to her and even to initiate her in his own work. He gladly consented and allowed her to spend a few hours daily in his office and to become interested in his business. This helped so much that she took part eagerly in his new voyage, without giving a thought to the water Now she became aware of the purpose of these commercial missions and participated actively in them, contributing a good deal to their success

In all of these cases, the patients were rational, useful, and able to work. In none of them were their problems appreciatively conspicuous so as to appear abnormal Their abnormality was elusive

---

FAMILY PHYSICIAN BACKBONE OF THE MEDICAL CARE SYSTEM

Dr Ward Darley, speaking on February 4 at the fourth annual National Conference on Rural Health in the Palmer House, Chicago, sponsored by the American Medical Association, cited the trend toward specialization in medicine This, he said, is wreaking havoc with patient-physician relationships.

"Medical care," he said, "no matter how superior it may be from the scientific standpoint, cannot be truly effective unless the patient-physician relationship is such as to permit the physician to make the maximum use of his own personality as an agent of comfort and therapy The general trend to impersonalize medical care, and thus deny our people one of the essentials of the best medical care, will be our undoing unless we do something to keep the personal physician, the general physician, the family physician, the general practitioner—call him what you will—in the scheme of things

"In rendering his services, the family physician will not infrequently need the specialist's help During a period of specialist care, however, the physician should keep in the closest possible touch with his patient's problem. We must realize that the health of a patient and the health of his family is not alone concerned with what may be taking place in the operating room, but with what may be taking place at home." The general practitioner, in his opinion, should be a physician "who is primarily interested in health and the prevention of disease"

"His interest in the individual will be one of continuity," he said, "not a series of short periods of interest that correspond with isolated episodes of illness The general practitioner is the only one already closest to our people and, if it were not for him, our problem of maldistribution of medical care would be infinitely worse than it is"

and applied for the child again At that time it was no longer available and, of course, no other infant would be accorded to her She was now on the list of the unreliable foster mothers However, she succeeded in adopting an illegitimate child by dealing directly, without anybody's intervention, with the young mother But again, within a brief time, she brought the child back to the despairing girl Within the next few years she repeated the same thing with other infants It was during the economic depression, and it was easy to plunge into the prevailing poverty and choose a child among the unwanted ones Once a physician was the intermediary between her and a person stricken with undesired maternity Her ready cash attracted some mothers and, in one case, even a couple She always managed to dispose of the babies by either returning them or giving them away to another sterile woman She never found fault with them and seemed to know that the defect was within herself

After many failures she visited the psychiatrist again, and then the search for a child, her effort to taste of motherhood, ended after several sessions of psychotherapy She joined a society of women visiting and helping mothers and newborn babies after their return from the hospital She is still active in this field

Case 3 —A man, fifty-six years old, living with his wife and two grownup children, had no complaint of physical ailments He was upset and at first reluctant in telling of what his disturbance consisted After some coaxing he said, "What I suffer from is so ridiculous that anybody would condemn me or call me a fool"

For many years he and his wife had owned a food store A year before his family had prevailed upon him to sell it and to start a less fatiguing and less exacting business He followed their advice, but then his difficulty started For a time he went every day to the old store and volunteered his services freely to the new owner Later, when he connected himself with another business of the same kind, his wife worked with him there and, although conditions were favorable, he found them unsatisfactory Thinking fondly of the days when he possessed the old place, of all the trifles related to it, he was often unable to sleep, or his dreams were full of the images of his customers of long ago whom he remembered affectionately Then his wife went to the new proprietor of the shop and succeeded in buying it back for a sum double the amount paid for it The patient, again together with his wife, took possession of his previous establishment, and for a brief time he was happy But shortly his indecision came back, and now he felt something was changed Some new, and to him unknown, situation had been added, or something had disappeared The "charm" which he had associated with the store had evaporated. The imaginary "poetry" with which he had endowed the prosaic counter had deteriorated in his imagination and now failed to inspire him.

At this time he was more unhappy than ever He discontinued working, stayed completely away from the store, and let his wife and clerk run it This patient suffered from a depressive psychosis, but his condition was not easy to discern for anyone not familiar with his indecision His behavior in ordinary matters was exemplary

This man, while openly on the best of terms with his wife and apparently well adjusted to her, really harbored a deep-seated aversion toward her He resented always being associated with her at his work He did not know that what he really wanted was to have a job without her

As soon as he gave up the idea of a store entirely and found an occupation in which she could not possibly join, he was cured

Case 3 —A man had had in his commercial career a similar experience, in this case regarding a factory and a partner in business To show his obsessive indecision he mentioned his necessity to "check the mailbox every half hour, knowing full well that the mailman could not have made a new delivery so soon" But he did not begin to suffer intensely from his mental condition until he "decided" to get married

When he was thirty-five, he loved a girl who responded quickly to his courtship During the months in which he saw her there were days when he was ardently attached to her and other days when he was in doubt about his feelings Sometimes his attentions were exaggerated, and he made a nuisance of himself At other times he neglected her, and the girl was in despair Her telephone calls and letters remained unanswered He vacillated so long she finally told him there was another suitor Then he became incensed and went to see her He worshipped her again and made the greatest effort to reconquer her But, as soon as she consented and broke with the other candidate, the patient cooled off and was indifferent. Now she did not wait long to carry out her threat and married the other man This threw the patient into melancholy

After a short time, however, he consoled himself by finding another girl, and a third, and a fourth. He pledged marriage to each one in all sincerity Yet just as sincerely he disengaged himself

At last he did marry and was sure that his problem was solved However, within a week or so he discovered his lack of interest in his wife and wanted to be released The more she loved him and clung to him, the more he felt guilty The more unhappy he was, the more faithful she grew It all ended in a separation, but he remained uncured His indecision in respect to women as well as in other matters persisted

Case 4 —In the blissful days before the present housing shortage, when living rooms were to be had for the asking, a woman, after considering several apartments, rented one The next day she regretted having done so, because she was sure that she preferred the one she had seen before. She went to the landlord who had leased the apartment to her and he agreed to refund the deposit. A few days later, however, she was convinced that the first apartment was better "It had more windows and a healthier exposure" This time, too, she succeeded in making the change But she regretted "the more comfortable kitchen and

On admission, he was in acute respiratory distress, sitting up in bed and perspiring profusely Expiratory stridor was noted, and the lungs were filled with musical and moist rales Temperature was 102 F, pulse 88, respiration 30, and blood pressure 108/74 Blood count and blood chemistry were normal There was no eosinophilia Serology was negative Urine examinations were negative (14) He was placed on sulfadiazine therapy and continuous oxygen, along with adrenalin and aminophylline as needed and ephedrine and phenobarbital capsules. Wheezing was audible to the unaided ear, and respiratory distress and cyanosis were severe in spite of oxygen and medication Circulation time (decholin) was normal Benadryl was started December 13 Cyanosis increased, and the patient exhibited signs of exhaustion He was placed on penicillin Atropine, demerol, adrenalin aminophylline, and ephedrine were ineffectual On the following day there was slight improvement coincident with a slight drop in temperature Pyribenzamine was substituted for Benadryl in the same dosage (50 mg every four hours) He received daily infusions of 1,000 cc of 10 per cent glucose in saline, each containing 2 cc of adrenalin

Suspecting the presence of a foreign body in one of the bronchi, bronchoscopy was ordered on December 16 but was cancelled because of the poor condition of the patient All medication except penicillin was discontinued On December 17 there was marked improvement, the chest was clear although expiration was prolonged, and respiration still appeared labored He continued fairly well until December 20, a period of three days In the interim he was bronchoscoped There was no evidence of foreign body It was noted that there was intermittent spasm of both main bronchi during the procedure The mucosa was reddened There was considerable thin, serous fluid aspirated from the lower portion of both main bronchi which refilled rapidly A second bronchoscopy was done on January 23 when it was noted that the mucosa was less red

On December 21 he again went into status asthmaticus, and his temperature rose to 102 F The next day it was 104 F There were signs of consolidation at the left base, but the status asthmaticus subsided completely X-ray revealed accentuation of vascular markings This was apparently an episode of pneumonitis During this period the penicillin was increased to 50,000 units every three hours from the 30,000 which he had been receiving previously Recovery from this intercurrent infection was uneventful, and, although his chest became clearer, the cough persisted.

On January 7 he again went into status asthmaticus Some measure of relief was obtained with infusions of 10 per cent glucose in saline containing adrenalin Additional therapy consisted of aminophylline suppositories and sedation. He continued in this condition until February 4 (almost one month) The patient continued to lose weight and remained cyanotic A bronchogram with lipiodol was negative for bronchiectasis Allergy work-up was negative, and it was the opinion of the consultant that the sinuses were the source of the allergens Sinus x-rays revealed clouding of the left frontal, ethmoid, sphenoid, and maxillary sinuses The turbinates on the left side were enlarged A left antrum puncture was done on December 11 The returning fluid was clear, and a diagnosis of hyperplastic maxillary sinusitis was made Penicillin aerosol during this period was ineffectual

On February 4 he again developed signs of pneumonitis X-ray revealed evidence of pneumonia The temperature rose to 104 F, and with this there was subjective improvement Wheezing and respiratory distress came on again as soon as his temperature returned to normal, and evidence of the pneumonic process cleared (February 14) On February 17 he had a violent chill lasting ten to fifteen minutes, followed by a rise in temperature to 103 F The cause was not determined X-ray of the chest was negative, but by February 20 the patient was almost symptom free

At this point it was suggested that, in view of the remission of symptoms during febrile periods, it might be wise to institute some form of fever therapy as a therapeutic measure Triple typhoid vaccine intravenously was suggested It was decided to withhold this treatment until he had had a trial of penicillin and streptomycin by inhalation, along with both antibiotics intramuscularly This was done, and by March 10 he was so improved that he was left alone However, on this date he again went into status asthmaticus All medication was then discontinued, and he was given triple typhoid vaccine, 25 million organisms well diluted in saline, intravenously This was followed by a chill and rise in temperature to 100 F By the next morning there was marked clinical improvement Respiration was easier, and the patient stated that he had had a comfortable night On March 11 he was given 50 million organisms There was a temperature rise to 103 6 F On the next day only a few scattered wheezes were found in the chest There was no cyanosis and the patient was able to lie flat in bed with no respiratory difficulty He was given a third dose, again 50 million organisms, followed by a rise in temperature to 105 F, with continued improvement He received two more injections (March 14 and 17), each followed by a temperature rise to 104 F

By March 18 the chest was clear, there was neither dyspnea nor cyanosis, and his general condition was excellent On March 20 he was allowed out of bed, and on March 27 he was discharged Only once, during the week before discharge, did he develop a sense of fullness in his chest which lasted one hour This cleared spontaneously He has been, and still is, under observation as an office patient (nineteen months) He has had no acute episodes but complains of tightness in his chest at night and in damp, foggy weather He receives up to 1 5 cc. of the vaccine subcutaneously (undiluted) at intervals of two to three weeks with instructions to rub the local area on arriving at home He was gradually built up to this dose from an initial dose of 0 1 cc This is usually followed by a rise in temperature of 101 to 102 F and eases the tight feeling On rare occasions there have been scattered musical rales

RESPONSE TO INTRAVENOUS TYPHOID VACCINE IN INTRACTABLE STATUS ASTHMATICUS

MORRIS FOGEL, M D , Brooklyn, New York

(From the Medical Service of Coney Island Hospital)

THE literature contains numerous reports on the use of fever as a mode of treatment of allergic states, with particular reference to its effectiveness in the termination of episodes of status asthmaticus and the general amelioration of symptoms thereafter [1–7] Much has been written on the use of pertussis vaccine along with suggestions as to reasons for its ability to produce desired effects [8–10] Autogenous vaccines are mentioned, and in passing, the use of intravenous typhoid is also considered, but with caution in that it is suggested that its use endangers the general health of the patient, especially in cases of elderly patients with or without generalized arteriosclerosis [2,3,11,12] The consensus of opinion apparently favors the elevation of temperature to therapeutic levels through the use of an external heating mechanism in the form of a heating cabinet of one form or another The most widely used is the Kettering Hypertherm which utilizes a cabinet through which hot moist air is circulated resulting in a gradual and controlled rise in temperature which is sustained for a period of several hours

Apparently, there are no detailed reports on the use of intravenous typhoid vaccine, nor an evaluation of its effectiveness in status asthmaticus The results obtained with fever therapy appear to be encouraging, but in the absence of elaborate equipment it would appear that any method used, if carefully controlled and if capable of producing the desired results, would be acceptable The use of triple typhoid intravenously in the treatment of chorea is well established, and its use is not questioned As to the danger involved in the handling of elderly patients, carefully controlled dosage should reduce this to a minimum and allow for its administration at any hospital

Klewitz used a mixture of killed bacteria (pyrifer) intravenously, given at four- to five-day intervals for three doses, obtaining temperature rises to 102 F No specific details are given as to results of therapy [11] Feinberg and Osborne noted that the advent of intercurrent infections in cases of asthma usually resulted in temporary amelioration of symptoms It was on this basis that they utilized a high-frequency current to elevate the body temperature of asthmatics Of 42 patients treated, 70 per cent of whom had complications, such as emphysema, chronic bronchitis, or bronchiectasis, and all of whom had not been relieved by the usual methods of treatment, 80 per cent improved clinically The authors note that perhaps persistent treatment with fever might have given better results and suggest it as a method of therapy where other methods fail [4] In another report 11 cases were treated with the Kettering Hypertherm [3] Eight (73 per cent) were much improved Hyde and Fairfax treated 20 cases of asthma with a humidified heating cabinet (Hypertherm), giving one treatment daily until what they termed a "primary response" was obtained [1] This was characterized by decreased bronchospasm, increase in moist rales, and a productive cough with a subjective feeling that the attack was going to end The number of treatments varied from one to four Seventy-five per cent showed clinical improvement One year later, all cases exhibited some symptoms, but they responded to home remedies and adrenalin where they had been refractory before The authors believed that repeated short elevations to 102 F were as effective as, if not superior to, longer and higher fever sessions, with less strain on the patient Philips and Shikany suggest a minimum of ten treatments with 15 to be preferred [6] The optimum number of treatments apparently has not been completely established

The case to be presented is one in which the use of standard New York Board of Health triple typhoid vaccine intravenously produced rather startling results where all other measures had failed

Case Report

P S , a thirty-eight-year-old white man, unemployed, formerly a hotel manager, was admitted to Coney Island Hospital on December 11, 1946, complaining of an inability to breathe for ten days with failure to respond to medication On the evening of admission he had received an injection of adrenalin and an ampule of aminophylline intravenously with no relief Three weeks previously, he had developed a cough with malaise and mild vertigo After two days in bed he improved, but the cough persisted Ten days before admission, while ascending a flight of stairs, he suddenly became dyspneic and remained so

His past history revealed pneumonia in 1942 while in military service It was subsequently learned that he was receiving Veterans Administration compensation for service-connected asthma which apparently followed this episode of pneumonia

THE ROLE OF BRONCHOSCOPY IN THE PREOPERATIVE DIAGNOSIS OF CARCINOMA OF THE LUNG

ADRIAN LAMBERT, M D , F A C S , New York City

AS SURGERY for cancer of the lung has progressed, more emphasis is being placed on the importance of early diagnosis It is timely, therefore, to evaluate the advantages and point out the limitations of bronchoscopy as a diagnostic procedure and as a factor in determining operability or inoperability

Peripheral tumors of the lung in their early stages cannot be visualized through the bronchoscope, and, therefore, they constitute the most favorable type for operability if exploration is done early More centrally located tumors can be visualized through the bronchoscope at an earlier stage in their development and produce symptoms earlier, but, because of their proximity to the heart, the esophagus, and great vessels, a relatively short extension of the process may preclude resection Centrally located tumors cannot be seen unless they protrude into the lumen of a bronchus that is visible through the bronchoscope Upper lobe branch bronchi can be seen for a short distance with the retrograde mirror, but the secondary branch bronchi are difficult to visualize A tumor in the dorsal branch of the lower lobe is difficult to see unless it protrudes into the main division of the lower lobe bronchus Similarly, a tumor may encircle a smaller branch bronchus, while its site of origin in the mucosa escapes detection

In view of the more radical approach to surgery in cases involving the mediastinum, the following points should be noted at bronchoscopy so that the surgeon will have as much information as possible before exploration [1]

Compression of the trachea laterally is significant as it implies the presence of a mass or of enlarged glands in the lateral tracheal chain. Involvement of the tracheal wall in the tumor process is, at present, considered a criterion for inoperability Resection of the trachea has been done experimentally, but it is not yet feasible in human surgery [2] Whether the mass can be resected or the glands removed can be determined only at operation. Pressure in itself does not imply inoperability Widening of the carina indicates the presence of an enlarged lymph node which is usually malignant However, such a gland has been successfully removed in the presence of a tumor, so that this finding does not in itself denote inoperability The surgeon should be aware of the presence of this gland before operation so that he will have an accurate picture of the extent of the disease process

Angulation and deviation of the main bronchus may be caused by atelectasis of the lung segment supplied by one of the lesser bronchi on the diseased side, due to compression of the lumen with tumor tissue If this mass is visible through the bronchoscope, its distance from the carina should be noted, also the branch bronchus involved in the tumor process, and, if possible, the site of origin of the tumor Pedunculated growths extending into the trachea or main bronchus from one of the lesser bronchi may give the impression of inoperability until it has been found that such extension has occurred Longitudinal striations in one of the bronchi imply compression from without If this pressure is below the carina, the tumor may be operable Bleeding is always suggestive of a neoplasm, especially if granulation tissue is visible

The use of the Papanicolaou stain to determine the presence of malignant cells in the bronchial washings has given the bronchoscopic examination increased significance [3] This test is based on the fact that tumors shed cells in their growth, and, therefore, washings or aspirated tumor secretions will contain individual cells that can be identified as malignant

A tumor should be classified as being as malignant as its most malignant cell [4] Therefore, the finding of a single cell with characteristics of a carcinoma should be sufficient to justify the diagnosis of carcinoma This technic requires the services of a skilled cytopathologist and is valuable in securing a positive preoperative diagnosis However, in suspected cases, an exploratory thoracotomy should not be postponed on the basis of a negative cell diagnosis, since a tumor in its early stage may not be within the range of this technic Whereas, formerly, a positive diagnosis was obtained by bronchoscopy in approximately 58 per cent of cases, it is now possible with this technic to secure a preoperative diagnosis in about 90 per cent of cases [5 6] Biopsy or cell washings should be taken in all cases in order to differentiate carcinoma from benign granulations seen in the presence of a foreign body or associated with tuberculosis or suppuration

In a recent series of resections for nonmalignant suppuration it was found that some of the bronchoscopic findings show a similarity to those usually found in malignant disease. In the accompanying table it will be seen that rigidity, angulation, and constriction of the main

in his chest At all other times the chest has remained clear He has regained his weight, and his general condition is excellent

Of all the laboratory work done, the only significant findings were a variable eosinophilia, ranging from none to a count of 18 per cent The highest count was coincident with the period of unexplained fever and diminished as his clinical condition improved Four sputum cultures were done All were negative for acid-fast bacilli Two revealed nonbudding yeasts, one revealed Micrococcus catarrhalis, and the last disclosed M catarrhalis and predominent Staphylococcus albus The latter was considered a contaminant Four sputum examinations were made for evidence of eosinophilia Three were negative, and one disclosed 1 5 per cent eosinophils

It should be mentioned that at various intervals he was given helium and oxygen and nicotinic acid by mouth and vein In the belief that there might be a psychogenic element involved, he was given repeated doses of sodium amytal intravenously with no effect other than narcosis The asthmatic state persisted while he dozed or slept sitting up

Discussion

Comment on the case itself would be superfluous at this point Practically everything in the therapeutic armamentarium was tried before resorting to hyperpyrexia as a mode of therapy Just why the treatment was effective is in the realm of conjecture Sputum cultures w remarkable If the sinuses contained org to which this patient was allergic, then o postulate the bacteriostatic or bacter action of the hyperpyrexia However cannot be proved in that the antral wa were clear and the fluid was not cultured. no positive statement can be made

Only one case is presented The usual responds more readily to ordinary measures did this one Perhaps if more of the se intractable cases of this type could be this form of therapy, a better evaluation be made

Summary

A case of status asthmaticus, prolon intractable, and resistant to all therapy, sponded dramatically to intravenous typh therapy

DISTRIBUTION OF NATION'S DOCTORS

A study which will provide accurate information about the supply and distribution of doctors in the United States for the first time is being made by Frank G Dickinson, Ph D , Chicago, director of the American Medical Association Bureau of Medical Economic Research Using information furnished by state and county medical societies, Dr Dickinson has divided the nation into 757 medical service areas, somewhat similar to the trade areas that have been used in studying buying and selling habits of the population Because doctors and patients often cross state and county lines to give and receive medical care today, the traditional methods of computing the supply and distribution of doctors by counties and states do not provide an accurate picture The number of persons per doctor in any county is a meaningless figure, and the state is too large to be used as a medical service area

A progress report on the study appearing in the April 9 issue of the *Journal of the American Medical Association* shows that every person in the United States lives in one of these 757 medical service areas and that there are doctors in each area on whom persons in the area usually depend for their medical care Although some persons live near the border of each medical service area and some live in counties that have no doctors, no one lives outside a medical service area People in each area obtain most of their medical care from doctors in that area The average number of counties per area is four The areas vary in shape and size, and few of the boundary lines coincide with the boundaries of counties Two hundred and twelve areas cross state lines and 545 are entirely within states The larger areas are in the less densely populated western states, including Texas, New Mexico, Arizona, Nevada, and Idaho

There are 1,090 primary medical service centers, of which 87 offer every type of medical treatment and surgery The remaining 1,003 primary centers are cities and towns which, relative to the nearby towns and villages, are primary sources of medical care A large number of areas have two or three primary medical service centers

TREATMENT OF MENOPAUSE BY ESTRADIOL PELLET IMPLANTATION

M V Okie, M D , Buffalo, New York

(*From the Mount Mercy Hospital*)

THERAPY of the menopause is psychosomatic, sedative, and endocrinologic From the endocrine standpoint, the menopause may be considered to be a condition of deficiency of the ovaries, just as diabetes mellitus is a deficiency of the pancreas, Addison's disease a deficiency of the adrenal cortex, etc Menopausal symptoms develop abruptly following ovariectomy—surgical or x-ray—or more gradually in the natural menopause

The symptoms of the menopause, including hot flushes, nervousness, insomnia, headache, etc , are sometimes ascribed to excessive production of gonadotropic hormone(s) by the anterior pituitary Yet, experimental evidence casts considerable doubt on this explanation. For example, many menopausal women with severe symptoms show no excessive gonadotropic excretion, and many women with high gonadotropic excretion at the menopause and at other times are without symptoms High gonadotropic hormone, therefore, probably does not give even the vasomotor symptoms of the menopause It is probable that lower folliculoid production by the ovary, with its diminishing suppressive action on pituitary function, results in increased production, not only of the gonadotropes but also of corticotropic, thyrotropic, and even lactogenic hormones Excessive stimulation of the thyroid accounts for much of menopausal symptomatology Conventional hormone therapy has been substitution therapy with estrogens by parenteral or oral administration in an attempt to compensate for the diminishing ovarian folliculoid production until the pituitary becomes adjusted to the diminished level of activity of the entire endocrine system.

Oral and parenteral estrogen therapy have their disadvantages Injections must be given three or more times a week, and oral tablets, capsules, or liquid must be taken at frequent intervals In addition to the inconvenience to physician and patient of parenteral therapy and the uncertainty of faithful cooperation on the part of the patient taking oral therapy, expense of these two methods of therapy should be considered Parenteral and oral therapy yield irregular estrogen blood concentrations Immediately after intramuscular injection, blood estrogen rises to the point considerably above normal and quickly falls to or below normal, with the resultant waste of the excessive amount Ideal hormone therapy substituting for any glandular deficiency simulates as faithfully as possible the normal, gradual, steady, straight-line production of hormone by the gland at fault The peaks and valleys of blood estrogen concentrations during parenteral estrogen therapy show this method to leave much to be desired Similarly oral estrogen therapy involves waste through lack of total absorption. In addition, there is frequently loss of estrogen by emesis

In consideration of these deficiencies in parenteral and oral estrogen therapy, a group of 11 menopausal women were treated by subfascial implantation of estradiol pellets, 25 mg * Such implantation of hormone supplies the patient with a veritable ovary as a source, for a period of months, from which is slowly absorbed an almost constant amount of estradiol closely simulating the natural production of estradiol by the normal functioning ovary As early as 1937, Deanesly and Parkes showed this method of hormone administration yields maximum effectiveness and is, therefore, most economical [1,2] The absorption rate of estradiol from such a pellet is remarkably constant [3] Loeser first employed pellets of estradiol clinically [4] Since that time many favorable reports on this method of therapy have been published [5-9] After a long experience with hormone pellet implantation therapy—folliculoids, luteoids, testoid, and corticoid—Greenblatt is of the opinion that this method most nearly approaches the endogenous mechanism of hormone secretion.[10] The implantation is best done at the same time as the removal of the ovaries In this way sufficient estradiol will be absorbed from the "ersatz" ovary in time to forestall the development of the usual deficiency symptoms of surgical menopause

The present study is concerned with 11 cases of severe menopause, natural and surgical, in which the usual parenteral and oral estrogen therapy, sedatives, hypnotics, and psychotherapy had been tried and found ineffective In ten of these patients one 25-mg estradiol pellet was implanted subfascially into the lateral aspect of the thigh about 4 inches below the hip

* The author wishes to express his thanks to Dr W H. Stoner Schering Corp Bloomfield New Jersey for the supply of Progynon pellets used in this study

TABLE 1.—Bronchoscopic Findings in 95 Cases of Bronchiectasis

	Uncomplicated Bronchiectasis	Bronchiectasis Associated with Lung Abscess	Lung Abscess and Tuberculosis	Acute and Chronic Suppurative Disease Limited to 1 Lobe	Acute and Chronic Suppurative Disease Involving Entire Lung
Total number of cases bronchoscoped	36	11	7	22	19
Bronchoscopic findings					
Inflamed reddened mucosa	12	3	3	7	4
Granulation tissue	0	0	3	1	2
Bleeding	0	0	1	1	1
Constriction of main bronchus	1	0	3	0	1
Constriction of branch bronchus	3	0	2	5	1
Distortion above carina	0	0	0	0	1
Rigidity of bronchial tree	0	0	0	0	1
Thickening of main bronchial mucosa	5	0	0	0	0

bronchus are occasionally seen in bronchiectasis and suppurative disease of the lung, whereas formerly such findings were considered to be characteristic of carcinoma only (Table 1)

Pathologically, peripheral tumors are usually of the adenocarcinoma type and metastasize by way of the blood stream [7 8] The centrally located tumors usually visible through the bronchoscope are of either the rapidly growing undifferentiated type or the squamous type, which is slow growing and may be present for months or even years before becoming inoperable

The postoperative survival rate of carcinoma of the lung will depend on the extent of the lesion at the time of operation rather than on the type of cell Therefore, the resectability of a tumor cannot be determined by bronchoscopy unless an extension can be noted, indicating inoperability Similarly, biopsy will not provide information as to the extent of the tumor

Formerly, exploration was not performed without confirmation of the presence of a tumor, either by a positive biopsy or by evidence of constriction of the main bronchus, widening of the carina, etc It has now been shown conclusively in a large series of cases of carcinoma of the lung that the operability rate is higher in cases in which the bronchoscopic examination is completely negative than in those cases in which the tumor is visible through the bronchoscope or constriction of the bronchi by the tumor is visible on direct bronchoscopic examination [7] However, with a resectability rate of 36 per cent in cases in which the biopsy was positive through the bronchoscope, this procedure still retains its place as a reliable criterion for pneumonectomy A negative bronchoscopic examination has influenced the surgeon to explore the chest on suggestive x-ray findings in an increasing number of cases, resulting in an increasingly higher rate of resectability than was formerly possible

In conclusion, utilization of the Papanicolaou technic has resulted in an increased number of pre-operative diagnoses in suspected cases of lung carcinoma It must be emphasized, however, that the scope of bronchoscopy is limited by the fact that the operability of a tumor can only very rarely be determined by this method The importance of a negative bronchoscopy should be borne in mind as indicating a favorable case for exploration, thus bringing about a higher rate of resectability of the tumor before metastasis has occurred

ANTIBIOTIC MISTS YIELD VARIABLE RESULTS AGAINST SINUSITIS

Daily treatment with fine mists of penicillin or streptomycin apparently gives most sinusitis patients no more relief than do other treatments which doctors have been using against the disease for years, according to three New York doctors Writing in the March 19 issue of the *Journal of the American Medical Association*, the doctors—Eduardo R Pons, Jr, Walter M Glass, and Bettina Garthwaite, of the Departments of Medicine and Otolaryngology of the College of Physicians and Surgeons, Columbia University, and the Presbyterian Hospital—say "In the ordinary case of chronic purulent sinusitis, antibiotic aerosol therapy given once daily appears to have no superiority over accepted methods of treatment of sinusitis"

Antibiotic aerosols appear to be extremely useful in treating patients with longstanding chronic sinusitis who have had repeated sinus irrigations or extensive surgical treatment with poor response, patients who do not tolerate sinus irrigations, and patients who have chronic bronchopulmonary disease as well as sinusitis, they say The doctors treated 23 patients with penicillin aerosol, 23 patients with ephedrine, a drug that contracts the mucous membranes and has been widely used for sinusitis, and 10 patients with streptomycin aerosol All of these patients had had sinusitis continuously for six months, and the average duration of the disease in all except those treated with streptomycin was 11 years. Treatments were given once daily, six days a week, and were continued up to four weeks Relief from sinusitis was about the same in penicillin-treated patients as in ephedrine-treated patients, among comparable cases

PLEURAL COMPLICATIONS OF STAPHYLOCOCCUS PNEUMONIA

PAUL H GUILFOIL, M D , Brooklyn, New York

(From the Second Surgical Service, Methodist Hospital)

IN 1946 Blumenthal and Neuhof published an excellent report on staphylococcus pneumonia in infancy and childhood [1] They recorded the fact that the disease had been considered a rare entity invariably accompanied by a very high mortality The authors noted that with the advent of sulfonamide and penicillin therapy, the course of this type of pneumonia had been considerably altered They stressed the usefulness of surgery in treating certain complications of the disease, particularly empyema and tension pneumothorax

Recently two cases of staphylococcus pneumonia with surgical complications have been treated by the Second Surgical Service of the Methodist Hospital The reports follow

Case Reports

Case 1 —C E , a fourteen-month-old, white, male infant, was admitted to the Methodist Hospital on February 2, 1948, having been ill for twenty-four hours with a cough and fever X-ray of the chest revealed a right lower lobar pneumonia The child was placed on penicillin, 50,000 units every three hours, and sulfadiazine, 5 grains every four hours In spite of this therapy, his temperature spiked to 104 F daily, and his respirations remained very rapid. X-ray, five days after admission, revealed a right hydropneumothorax. The next day a thoracentesis was performed, 15 cc of pus evacuated from the right pleural cavity, and 100,000 units of penicillin introduced into the cavity A pure culture of Staphylococcus aureus was grown from the pus evacuated from the right pleural cavity

On February 8, six days after admission, the child was worse, and an oxygen tent was ordered Chest x-ray the following day revealed increasing right pneumothorax with considerable shift of the mediastinum to the left The next day the child was obviously critically ill. His temperature was 103 4 F , his respirations were rapid and labored, and he was cyanotic, even in an oxygen tent

Accordingly, eight days after admission, a closed thoracotomy with underwater drainage was done under local anesthesia with 2 per cent procaine A Number 22 Pezzar catheter was inserted through the right eighth intercostal space Upon releasing the catheter there was an immediate gush of air, indicating considerable positive pressure in the right pleural cavity The catheter was aspirated, and about 150 cc of thick yellow pus evacuated. At the completion of the procedure the response was dramatic, the child's respirations immediately becoming much slower and less labored

After establishing the closed thoracotomy, the child continued to receive penicillin and sulfadiazine, and further, 50,000 units of penicillin were inserted into the pleural cavity twice daily The child gradually improved

Four days after establishing the thoracotomy, 2 cc of methylene blue were introduced into the right pleural cavity through the thoracotomy tube The next day the child's lips were stained blue, proving the existence of a bronchopleural fistula

Sixteen days after the institution of closed drainage, the child pulled the Pezzar catheter out of his chest At this time re-expansion of the right lung was not complete, and there was x-ray evidence of pneumonic infiltration of the right middle and lower lobes Nevertheless, re-expansion and resolution continued, and the child was discharged as recovered on March 12, 1948, after a hospital stay of forty-one days

Case 2 —C A , a twenty-seven-day-old, white, female infant, was admitted to the Methodist Hospital on April 11, 1948, with a twenty-four hour history of fever, anorexia, and rapid, labored respirations X-ray study showed a massive left pleural effusion The child was critically ill She was placed in an oxygen tent and given 30,000 units of penicillin every three hours intramuscularly, and 2 grains of sulfadiazine every four hours by mouth

The next day a thoracentesis was performed and 5 cc of pus evacuated A pure culture of hemolytic S aureus was grown from the pus.

On the following day x-ray revealed a left pneumothorax, with marked shift of the mediastinum to the right Surgical consultation recommended a closed thoracotomy, if a bronchopleural fistula were present Two cubic centimeters of sterile methylene blue were inserted into the left pleural cavity, and the next day the blue color appeared on the baby's lips

Three days after the baby's admission, a left closed thoracotomy was performed under local anesthesia The procedure was done on the ward with the baby in an atmosphere of oxygen, because her general condition was so poor that removal to the operating room would have endangered her life

A Number 12 French catheter was inserted through the left seventh interspace, and 30 cc of thick, bluish (methylene blue) pus were evacuated under considerable positive pressure

Closed thoracotomy was followed by improvement in this baby's general condition, although the response was not nearly so dramatic as in the previous case Sulfadiazine and penicillin were continued, and 50,000 units of penicillin in 10 cc of sterile distilled water were inserted through the thoracotomy tube twice daily

X-ray taken on the fifth day after admission showed some re-expansion of the left lung and also pneumonic infiltration of the right upper lobe There was gradual resolution of the pneumonic process and re-expansion of the left lung Ten days after insertion, the catheter was removed, since

joint One patient received an additional 25-mg pellet six months after the first implantation

Technic of administration was as follows Under local anesthetic and under strict asepsis, a 1/4-inch incision was made in the skin over the medial aspect of the upper third of the thigh, and with a curved Kelly forceps a subcutaneous tunnel above the fascia lata was created by blunt dissection, the forceps being pointed upward The blades of the forceps were spread and the pellet grasped with the tips and inserted into the subcutaneous tissue, being pushed to the high point in the subcutaneous tunnel Incision was closed by one skin clip No tissue reaction at the site of the implantation was noted in any case

Careful follow-up of each of these 11 cases showed that all were promptly relieved of their menopausal symptoms This relief was not for only a few days, as that from parenteral and oral therapy, but from six to eleven months In one patient excessive menstrual bleeding was not relieved However, at hysterectomy submucous and intramural fibroids were revealed In this patient, as in all the others, subjective symptoms were greatly relieved by estradiol pellet implantation No evidence of malignancy has been noted in any case

Table I compares the symptomatology of this series of 11 cases with that of Hawkinson's series of 1,000 cases, showing the percentage and number of patients in whom the 18 symptoms listed by Hawkinson appear [11]

TABLE 1 —Comparison of Symptomatology of Present Series with Hawkinson's Series

Symptoms	Number of Patients Showing Each Symptom	Present Series (Per centage)	Hawkins (Per centag
Nervousness	11	100	98 0
Menstrual disturbances	10	91	95 5
Flushes and chills	10	91	95 2
Excitability	7	63	88 4
Fatigability and lassitude	8	72	83 0
Depression and crying	4	36	81 6
Irritability	9	81	79 2
Insomnia	11	100	72 3
Tachycardia palpitation dyspnea	8	72	71 3
Vertigo scotomas	11	100	63 3
Decreased memory and concentration	6	54	63 0
Headaches	9	81	62 2
Frigidity	8	72	47 8
Numbness and tingling	7	63	44 7
Occipitocervical aching	11	100	40 3
Vague and indefinite pains	8	72	38 5
Excessive sweating	6	54	32 0
Formication	6	54	30 7

Summary

1 In 11 cases of menopause, estradiol pellet implantation therapy brought prompt relief from all symptoms for periods of six to eleven months

2 Frequency of incidence of symptoms is tabulated

3 Estradiol pellet implantation therapy most nearly approximates physiologic, endogenous estrogen production

4 Estradiol pellet implantation most nearly approaches ideal estrogen therapy, particularly in its economy of hormone material and in conserving the time of the physician and patient

FINDS MONGOLISM TO BE A GROWTH DEFICIENCY

Mongolism, a type of idiocy present at birth apparently is not inherited, concludes Clemens E Benda, M D , of Waverly, Massachusetts, who has studied 389 cases Mongolism takes the largest toll of all abnormal prenatal conditions among the normal population of the United States About three out of every thousand children born in a general lying-in hospital in this country are affected Mongoloid babies are especially lively and imitative and have characteristic slanting eyes, flattened skull, and short thumbs and little fingers

Dr Benda believes mongolism is a "decelerating growth deficiency" that occurs during the early part of pregnancy and is caused by an abnormal maternal condition at this time Any normal mother is potentially the mother of a mongoloid baby if she is approaching middle age or carries [illegible] under certain adverse conditions, he points out One mongoloid child may be expected among 8,000 births if the mother is between 20 and 24 years of age, but the incidence increases to 12 5 per cent if the mother is between 45 and 47 years, according to Dr Benda A high percentage of the mothers of mongoloid babies appeared to have endocrine disorders, especially thyroid disorders In the younger age group—21 to 40 years—nearly 39 per cent had thyroid glands that did not function normally

Supporting the belief that mongolism is not due to heredity, Dr Benda found that mothers who had a mongoloid child after the age of 41 were "average to superior citizens" and that nearly all brothers and sisters of mongoloid children were normal Many of the brothers and sisters were honor students in schools and universities

TREATMENT OF ITCHING DERMATOSES WITH AN OINTMENT CONTAINING TWO PER CENT DIPHENHYDRAMINE (BENADRYL HYDROCHLORIDE)

ARTHUR J PHILIP, M D , Rockville Centre, New York

(From the Department of Dermatology and Syphilology, New York Medical College, and the Metropolitan Hospital Research Unit, Welfare Island)

THAT Benadryl is a highly effective antihistamine agent has been well established [1-10] The adaption of this activity for the control of itching dermatoses was attempted successfully in a variety of ointment bases shortly after its synthesis [11] It was felt that the effectiveness of this material would be enhanced by a more suitable ointment base *

Methods and Materials

One hundred unselected consecutive cases of various itching dermatoses that applied for treatment in private and clinic practice were included in the present investigation (Table 1) Every fourth case was used as a control (Table 2)

There were 59 women and 41 men ranging in age from six months to seventy-two years

All of these patients had had previous medication, the duration of the previous treatment depending on how long the itching had been present Their previous treatment had consisted of many types of locally applied drugs, ranging from the innocuous type, such as calamine lotion or boric acid ointment, to severe dermatologic irritants, especially of the proprietary type, containing salicylic acid in high concentrations and benzoic acid Fourteen of the cases showed lesions that were secondarily infected, and these were treated with wet dressings until the impetiginized areas were clear and the basic dermatoses could be determined After the secondary infection was cleared, they were then included in the groups for treatment with Benadryl

The cases were all treated in the same manner Soap and water were banned and mineral oil was used for cleansing the skin The ointment was rubbed into the affected areas twice daily, but, where itching recurred, the use of the ointment was permitted as often as the patient desired

The 15 cases, used as controls, were treated in similar fashion except that the ointment employed contained no Benadryl—it was made up of Carbowax 1500 with 10 per cent propylene glycol The members of this group were not aware that they were being treated with a placebo

As many of these itching dermatoses were due to topically applied drugs, and as some were induced or aggravated by drugs taken internally all medication other than the Benadryl ointment, was barred

In recording our results, cases that obtained relief estimated at 50 per cent or more were listed as "partial relief", those obtaining less than 50 per cent relief, or where the relief was temporary, were listed as "no relief "

Results

The results in Group 1 (Benadryl ointment group) ranged from no effect to excellent (Table 1)

In the series of neurodermatidides, three patients relapsed when the ointment was discontinued after cure had apparently been established The group of controls of neurodermatitis cases showed some partial, but very temporary, relief of itching All symptoms returned within a week after the ointment was discontinued

In the group with atopic eczema (infantile eczema), cure was complete and permanent in four cases within two months In four that showed incomplete but definite improvement, there was a tendency for the condition to recur when the ointment was discontinued No attempts were made to alter the diets of any of the children treated There was no effect in the control series

The group of contact dermatidides, totaling 19 cases, showed the best results of any of the dermatoses treated Eighteen of the 19 cases were due to various cosmetics, one was due to penicillin ointment There were seven cases of dermatitis caused by nail polish, five caused by hair shampoo, two cases due to tooth paste, and five due to unknown cosmetics

Thirteen of the 15 cases of contact dermatoses treated with Benadryl ointment showed immediate relief of the itching and objective symptoms (redness, local heat, scaling, and fissuring), and this relief continued during the course of treatment, which did not exceed two weeks

* The ointment used in this study was supplied through the courtesy of Dr E A. Sharp director of clinical investigation, Parke, Davis and Company Detroit Michigan. It is called Benadryl Hydrochloride cream and has the following composition cetyl alcohol 20 0 Gm. Carbowax 1500 4 0 Gm. methyl hydroxyl benzoate 0.2 Gm. propylene glycol 10 0Gm. Benadryl hydrochloride 2 0Gm and water 63 8Gm

drainage had ceased and the catheter did not appear to be functioning

A left thoracentesis was performed on the twenty-fourth hospital day, and a small amount of purulent fluid obtained Culture of this showed S aureus X-ray taken on the twenty-ninth hospital day showed some pyopneumothorax in the region of the left base

At this time the pediatric and surgical services considered the advisability of performing open thoracotomy, with resection of a rib However, the child looked well, was afebrile, and had gained considerable weight In view of these facts the baby was discharged, and her progress will be followed in the outpatient department This baby was in the hospital for a total of thirty-one days

Discussion

When we saw the first baby described above, it was obvious that the child was *in extremis* and that death would result if the child's respiratory embarrassment were not relieved quickly Therefore, the thoracotomy was done as an emergency procedure When we were asked to see the second child described above, we procrastinated before doing the thoracotomy We thought that the procedure should not be done unless there definitely was a bronchopleural fistula present As a result we waited about forty-eight hours after first seeing the child before performing the thoracotomy

Blumenthal and Neuhof stress the fact that pleural complications are common in staphylococcus pneumonia, that they may occur early in the disease, and that they may be the cause of death, even in spite of prompt and adequate treatment It is our purpose in presenting this report to emphasize further the necessity for rapid surgical intervention in the event of pleural complications It is our belief now that surgical intervention should be instituted immediately on demonstrating the presence of pus in the pleural cavity, without waiting to prove the presence of a bronchopleural fistula, which will be present in a large percentage of cases Closed thoracotomy is a simple procedure and can be performed without taxing an infant The presence of empyema or pyopneumothorax, complicating an already present staphylococcus pneumonia, will almost certainly mean the death of the child Prompt surgical drainage and/or release of increased intrapleural pressure may be life-saving

Summary

1 Two case reports of pleural complications of staphylococcus pneumonia are presented

2 The importance of prompt surgical treatment of these pleural complications is emphasized

LETTER OF NATIONAL PHYSICIANS COMMITTEE

Recently, the New York County Medical Society, with a total membership of nearly 6,000 voted disapproval of the $25 A M A assessment The vote was 333 for and 432 against The action reversed a vote taken by the same group in January At that time, the vote was announced as four-to-one in favor of the assessment *

In reporting the meeting, the New York *Times* said

"Resentment was felt against the A M A by some members of the New York County Medical Society because of a letter circulated to the medical profession recently by the National Physicians Committee, the lobbying organization of the A.M A The letter opened with the greeting 'Dear Christian American' There was said to be no doubt that this letter, by raising the issue of discrimination, had alienated some Jewish as well as non-Jewish physicians

"At least one group in the county society felt that the vote was auspicious because it was said to indicate the existence of a large group of independently thinking physicians who could neither go along with the 'right,' as represented by the A M A , nor completely with the 'left' This group thought the vote moved the society somewhat more nearly to the center"

The "Dear Christian" letter to which the *Times* referred was written by Dan Gilbert Again we must reiterate that the A M A had nothing to do with the preparation or distribution of the Dan Gilbert letter The February 26 A.M A JOURNAL said "the Gilbert letter was sent without the knowledge of any official of the A M A , that every official of the A.M A joins in condemning the letter as an expression of medical opinion in this country and that the A M A does not require allies of doubtful repute in its campaign for the maintenance of a high quality of medical care and for freedom in medicine in this country"—*Secretary's Letter, A M A , March 14, 1949*

* A final overwhelming vote in favor of the assessment was adopted at a later meeting attended by approximately 2 000 members

TABLE 2.—EFFECT OF CONTROL OINTMENT UPON VARIOUS ITCHING DERMATOSES

Diagnosis	Number of Cases	Duration of Disease	Results*	
			Partial Relief	No Relief
Neurodermatitis	3	Up to 6 years	1	2
Atopic eczema	2	Up to 6 years	0	2
Contact dermatitis	4	1 day to 10 days	4	0
Lichen planus	1	6 months	0	1
Drug eruption	1	2 months	1	0
Post scabies	1	6 weeks	0	1
Urticaria, chronic	1	4 months	0	1
Poison ivy dermatitis	2	2 days 3 days	1	1

* None of the patients obtained complete relief when using the control ointment

ing, as all weeping and itching disappeared within thirty-six hours. Three cases in this group had considerable relief, but the symptoms persisted for eight days.

There were two cases of poison ivy dermatitis used as controls—of these one was apparently not affected by the ointment, the other showed slow improvement over a period of one week.

Four cases of pruritis ani and one case of pruritus vulvi, all of undetermined cause, were treated. Four of these obtained complete relief as long as Benadryl was used but relapsed when the ointment was discontinued, in one, the relief was permanent.

Five cases of guttate psoriasis showed no effect from the use of the ointment, two cases of pityriasis rosea showed some improvement, but this effect could be accounted for by the natural and spontaneous subsidence of this disease.

One case of seborrheic dermatitis, one of herpes zoster, two of generalized pruritis due to jaundice, and two cases of acne vulgaris were treated without great effect.

Discussion

Benadryl ointment has definite indications in the control of various itching dermatoses. Its greatest use apparently lies in that group of dermatoses where an allergic-like histamine liberation plays the greatest part. This effect would be expected from the response of most of the allergic diseases to the antihistamine drugs taken by mouth or intravenously. Neurodermatitis, atopic eczema, contact dermatitis, and rhus poisoning were very successfully treated with the Benadryl ointment, and, as adequate controls in this group of diseases were not appreciably helped, the curative effect can be ascribed to the Benadryl itself. This is true on both theoretic and clinical grounds.

It will be noted from a comparison of Tables 1 and 2 that there are certain self-limited dermatoses that were aided by both the Benadryl ointment and the control ointment, and, unquestionably, time was a factor in the cure of these conditions. Contact dermatitis of all types, including poison ivy dermatitis, would fall into this group. Inasmuch as the response to the ointment containing Benadryl was more complete, much more rapid, and of much greater duration, there is no question but that the Benadryl itself was the specific agent that produced the result.

No instances of the commonly observed signs of Benadryl intoxication, such as drowsiness, nausea, vertigo, etc., were seen, suggesting that the effect of the Benadryl was local rather than systemic. No irritation or sensitivity to the ointment itself was found in either the Benadryl group or in the control group, so that no contraindications to the use of this ointment were encountered.

Summary and Conclusions

Eighty-five cases of various itching dermatoses, constituting 24 different diseases, were treated with a specially prepared ointment containing 2 per cent Benadryl. Of these, 44 (51.8 per cent) obtained complete and lasting relief, 18 (21.1 per cent) obtained partial relief, and 23 (27.1 per cent) had little or no relief. The high incidence of cure in certain groups of dermatoses, particularly neurodermatitis (84.8 per cent) and contact dermatitis (86.7 per cent), makes very definite the indications for the use of this ointment. No contraindications were noted.

TABLE 1.—EFFECT OF BENADRYL HYDROCHLORIDE UPON VARIOUS ITCHING DERMATOSES

Diagnosis	Number of Cases	Duration of Disease	Results	
			Complete Relief	Partial Relief
Neurodermatitis	13	6 months to 10 years	11	1
Atopic eczema	10	Up to 4 years	4	4
Contact dermatitis	15	1 day to 2 weeks	13	1
Dermatitis herpetiformis	2	4 years, 8 years	0	1
Lichen planus	2	6 months 11 months	0	0
Drug eruption	2	3 months 4 months	0	1
Post scabies	1	2 months	1	0
Exfoliative dermatitis (gold)	2	6 months 1 year	2	0
Chilblain	1	10 years	1	0
Exfoliative dermatitis (contact)	2	2 months 4 months	0	1
Acrodermatitis pustulosa perstans	1	3 years	0	0
Urticaria acute	1	2 days	1	0
Urticaria chronic	1	4 years	1	0
Soap dermatitis	2	6 months 2 years	0	0
Dermatophytosis	1	4 years	0	0
Poison ivy dermatitis	11	2 days to 2 weeks	8	3
Pruritis ani	4	3 months to 12 years	1	0
Pruritis vulvi	1	7 months	0	0
Pityriasis rosea	2	5 days 12 days	0	0
Psoriasis	5	6 months to 24 years	0	1
Seborrheic dermatitis	1	4 months	0	1
Herpes zoster	1	3 weeks	0	1
Generalized pruritis	2	6 months 14 months	1	1
Acne vulgaris	2	8 months 15 months	0	2

At the end of this time 13 patients were discharged as cured, and there were no recurrences Of the remaining two, one was partially relieved, the other was not helped

Of the four cases of contact dermatitis in which the control ointment was used, none experienced more than fleeting relief, and at the end of three weeks, all still showed some irritation from the original noxious agent Fourteen cases in this entire group of contact irritation showed positive patch tests to the offending materials

Two cases of dermatitis herpetiformis were treated One obtained no relief, the other stated that she had some benefit as long as the ointment was continued At the end of three months, however, relief from itching, even in this one case, had to be sought in other ways

Three cases of drug eruption were treated, two due to phenobarbital and one due to atropine The relief secured by the use of Benadryl ointment was incomplete and temporary, and approximately the same amount of cessation of symptoms was obtained in the patient that was treated with the control ointment

Two cases of severe itching following apparent cure of scabies were encountered The pruritis had been present for two months, although there were no signs of scabies or dermatitis due to the sulfur ointment which had been used in its treatment After the first application of Benadryl ointment, relief was complete and lasted for one week. Benadryl was then stopped and the control employed The pruritis promptly recurred to disappear again with the use of the Benadryl ointment Ten days of further treatment cured the condition permanently

Two cases of exfoliative dermatitis, caused by gold sodium thiosulfate given intravenously for rheumatoid arthritis, cleared up with weeks on the use of Benadryl ointme crude liver extract injections, althou patient had received about 30 liver in prior to the institution of treatment wi adryl

On the assumption that some of the sy of chilblain are due to liberation of hi one such case was treated during the of January, when the symptoms were height Relief was immediate and throughout the following cold months, ev the ointment was discontinued As th seasonal disease, no further attempts at r the acute symptoms can be made unt winter

One case of generalized exfoliative der probably due to contact with 10 per ce monated mercury, was not helped nor v case of acrodermatitis pustulosa perstans lar psoriasis)

One case of generalized urticaria due ingestion of shrimp was relieved imme following the application of Benadryl oin A second episode, produced by a test c shrimp, was not relieved by the contro ment, but was again promptly cured b Benadryl ointment

During seven days of treatment with Be ointment, generalized chronic urticaria, p in one patient for several years, disappeare has not recurred in eight months of observat

Two cases of dermatitis of the hands c soap and one case of dermatophytosis of th obtained no relief that could not be ascrib the discontinuance of soap and water on the

Eleven cases of poison ivy dermatitis treated In eight cases the results were gr

the catastrophe lulled the examiner into a false sense of security

The dissection occurred in two stages the initial episode of choking and dyspnea represented the incomplete rupture of the aortic intima, and the final episode was the actual dissection of the aortic media This is clearly evidenced by the sudden appearance of an aortic diastolic murmur with its concomitant peripheral phenomenon in a patient who had never had any detectable cardiac abnormalities The addition of an absent pulse in the right femoral artery is evidence that the dissection traveled the length of the aorta as far as the common iliac branches The suddenness of death was due to a rupture of the aorta through the adventitial coat, probably in the abdominal portion

Case 2 —This patient was a forty-six-year-old housewife who was first seen in May, 1945, for headaches, flushes and flashes, irregular menses, and swelling of the ankles These symptoms had been present for six months The pertinent physical findings were obesity (weight 226 pounds) and a blood pressure of 200/130 The heart was normal The impression was that of a menopausal syndrome and essential hypertension The patient was placed on oral estrogenic therapy, a 1,000-calorie diet, and small doses of thyroid were prescribed Dietary restriction was supplemented with vitamin therapy On September 11, 1945, the patient weighed 207 pounds, and the blood pressure was 160/115 Cardiologic examination at this time was normal On September 15, 1945, the patient was attending a block party for a returned veteran, friend of her late son, killed in the war During the festivities, she was seized by a sudden, severe pain in the upper sternal region and lost consciousness She was immediately seen by another physician who stated that the blood pressure was 100/95 and that the patient was in a semiconscious state but did react to painful stimuli This state of semiconsciousness lasted for about twelve hours When seen on September 16, the patient was alert and had no recollection of the events of the preceding twelve hours The blood pressure at this time was 190/115, the heart sounds regular and pure, and an electrocardiogram taken then was normal (Fig 1A) The patient had a low grade temperature The examiner thought that the patient had had a coronary occlusion, but repeated electrocardiograms revealed no evidence of a myocardial infarction (Fig 1) On September 27, 1945, twelve days after the acute episode, a faint diastolic murmur was detected over the aortic area The patient ran a low-grade temperature, and with the appearance of a murmur an endocarditis was suspected. Repeated blood cultures were negative, and other laboratory procedures were normal except for a moderate leukocytosis On October 19, five weeks after the acute onset, the electrocardiogram showed evidence of beginning left ventricular strain The patient complained of a constant dull pain in the upper sternal and interscapular areas The diastolic murmur became more prominent and was accompanied by a very rough aortic systolic murmur The second aortic sound became palpable This latter fact and increasing evidence of an

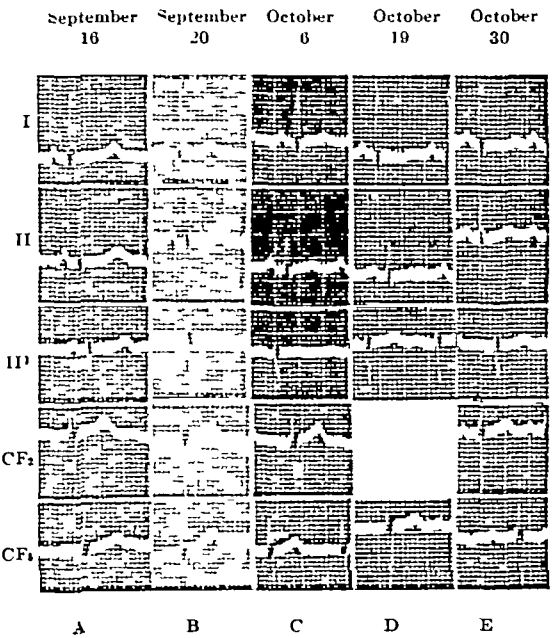

FIG 1 The electrocardiograms taken on September 16 and 20 are within normal limits Fig 1C shows a decrease in the height of the T waves, indicating a beginning myocardial strain In Fig 1D, the T waves in lead I have become inverted, and in Fig 1E the T's in lead CF4 are inverted This is the pattern of a left ventricular strain There is no evidence in the series of tracings of a coronary occlusion

aortic insufficiency raised the question of a leutic aortitis and leutic aortic insufficiency She was hospitalized on February 20, 1946, and penicillin therapy instituted, using a schedule advised in syphilitic cardiovascular disease There was neither laboratory, clinical, nor historical evidence for a luetic infection X-ray and fluoroscopic examinations at this time revealed a markedly widened and dilated aortic arch and an enlarged heart with an aortic configuration

The patient was discharged on March 20, unimproved except for a subsidence of the temperature She was seen once monthly in the following two years and during these examinations, the blood pressure persisted around 190/110 During this period, there were short intervals of pain in the upper chest and back and limited bouts of low grade temperature

Comment —The acute episode of substernal pain, fall in blood pressure, and shocklike condition simulated an acute myocardial infarction, but no evidence was forthcoming to substantiate this impression The appearance of a diastolic murmur over the aortic area is certainly unknown in an acute coronary occlusion although a diastolic murmur just above the apex may occur in a left ventricular aneurysm secondary to an infarction

The appearance of a diastolic aortic murmur and the palpability of the second aortic sound is accepted prima facie evidence that a luetic process

MILTON SCHLACHMAN, M D , Corona, New York[1]

(From the Department of Medicine, New York Medical College, Flower and Fifth Avenue Hospitals)

ALTHOUGH the dissecting aneurysm of the aorta is no longer the medical curiosity it was in the past, it is still sufficiently unusual and at times so protean in its manifestations as to make the antemortem diagnosis a difficult one It is estimated that one out of 381 autopsies reveals a dissecting aneurysm of the aorta, but until 1946 the antemortem diagnosis had been made correctly in only 57 instances of the 502 cases reported [1 2] Even more important, the lack of awareness of that stage of dissecting aneurysm which may exist before physical signs have developed or before dissection has actually occurred may lull the physician into a false sense of security and a favorable prognosis offered Nothing can be more disconcerting to the physician than to tell the family that a serious condition does not exist and then have the patient die suddenly

It is the purpose of this paper to review briefly the more important causes and diagnostic criteria and to report two cases of dissecting aortic aneurysms which, when first seen, offered difficulty in diagnosis It is realized that without autopsy confirmation some doubt may be expressed concerning the author's conclusions, but it is felt that the development of the clinical picture in each case justified the conclusions

Case Reports

Case 1 —The patient, a forty-year-old woman was first seen in December, 1941, for "migraine headaches" which had begun eight years previously These headaches were left hemicranial, of excruciating character, and appeared a few days before the menstrual period The attacks were not relieved by the usual analgesic drugs, and during this eight-year period a variety of treatments were ineffectual The patient was a very severe psychoneurotic who completely dominated her family Physical examination disclosed nothing more than a slight degree of myopia and a deviated nasal septum

A therapeutic test with ergotamine tartrate (0 5 mg subcutaneously) administered during an attack brought instant relief and established the diagnosis of migraine The patient was taught to self-administer the drug subcutaneously In the ensuing years, the migrainous attacks became more frequent (once weekly) so that ergotamine tartrate was used often During these years she was seen for various functional complaints, and examination always revealed her to be in good physical health She was seen on February 18, 1946, because of pain in the left shoulder with radiation into the forearm Examination was again normal A diagnosis of brachial neuritis was made, and the patient responded to symptomatic treatment

On February 26, 1946, the patient was seen at home and gave the following story At 8 00 A M , while looking out of the window, she was seized with a choking sensation in the throat and for a few moments had some difficulty in breathing The choking lasted for about five minutes Examination at this time was absolutely normal, and the patient did not appear ill The blood pressure was 120/75 Because of the history, an electrocardiogram was taken but found to be normal It was thought that the patient's complaints stemmed from a psychoneurotic basis However, she was put to bed with the absolute assurance that a serious condition did not exist The attack was classified as a "globus hystericus "

Because of no further complaints, she was allowed out of bed two days later That afternoon at 2 00 P M , while standing over the stove, she was again seized with a choking sensation similar to the initial attack Re-examination at this time was again normal The blood pressure was 120/75, the pulse was normal, heart sounds pure, and a repeated electrocardiogram showed no abnormalities The patient was put to bed and again reassured as to the nonseriousness of the symptoms At 9 00 P M she complained of excruciating pain in the lower back which radiated around both sides into the abdomen and of numbness and tingling in the right lower limb Examination now revealed a complete change in the findings The blood pressure which had been 120/75 was now 145/40 A diastolic murmur was heard over the aortic area, and this was transmitted down the left sternal border The abdomen was soft and revealed no evidence of an intra-abdominal condition The right lower extremity was colder than the left, although not discolored, and there were absent pulsations in the entire course of the femoral artery For the first time, it was realized that the patient had a serious vascular condition, and the family was told of the critical nature of the disease Morphine sulfate was administered, but the patient complained of severe pain in the back and abdomen throughout the night At 10 00 A.M the next day, the patient asked for the bedpan, and as her husband approached, she emitted a shriek and died

Comment —This is a case of a young woman who developed a dissecting aneurysm of the aorta in the absence of associated hypertension which is present in 78 per cent of the cases reported Although a medial cystic necrosis is accepted as the basic pathologic condition necessary for a nontraumatic dissection to occur, the vast majority of the cases occur in known hypertensives The classification of this patient as a psychoneurotic and the absence of physical evidence for three days before

A dissecting aneurysm often materializes in two stages, as is well illustrated in the first case report [6] The first stage is the stage of symptoms and is due to the incomplete rupture of the aorta without dissection. (It is now agreed that the intimal rupture takes place from without inward, i e, from the medial coat through the intima) The symptoms consist of a choking sensation, as was present in the first case, fainting due to irritation of the aortic depressor nerves, as was present in the second case, sudden dyspnea, stabbing or tearing substernal pain, cough, hemoptysis, and fever The blood pressure may be high or low in this stage but is more often high.

The second stage of dissection may not occur for days or even not at all The incomplete rupture of the aorta is more common than the dissection and is often mistaken for a coronary occlusion because of the electrocardiographic changes suggestive of myocardial infarction.[21] Autopsy often disclosed no involvement of the coronary vessels [21] Luetic aortic insufficiency and rupture of the aortic valves enter in the diagnosis because of the development of systolic and diastolic aortic murmurs [3] The sudden appearance of an aortic insufficiency in a known hypertensive is indicative of an aortic tear [20] This is clearly demonstrated in the second case where an aortic diastolic murmur suddenly developed, shortly after the initial dramatic episode

If the second stage of dissection does not occur, the clinical picture will be that of an aortic insufficiency with congestive heart failure which is exemplified in the second case [3 20] This patient never went beyond the first stage of incomplete rupture of the aorta In the stage of dissection the signs and symptoms will depend upon the extent and direction of the dissection. Any of the aortic branches may become occluded with the development of a sudden hemiplegia, paraplegia, pain radiating into the abdomen or extremities, paresthesias, cyanosis of the face due to venous obstruction, and marked throbbing in the neck Sudden death is caused by rupture of the dissecting blood column through the adventitial coat into the mediastinum, pleural cavity, or abdomen, or from cardiac tamponade

Nissim recently has described a new sign which is suggestive diagnostically [2] It is a unilateral reduplication of the carotid artery pulsation due to a difference of the rate of propagation of the pulse wave through the artery and through its dissected coats where the blood is partially clotted

Loque considered a brut and thrill over the femoral artery diagnostic, and Roesler *et al.* a rapidly shifting area of pulsation in the interscapular area over which the second aortic sound was markedly accentuated [22, 3] Shennan suggested that a delay in the conduction of the pulse beat was diagnostic [4]

At times x-ray demonstration of the dissection is possible with the finding of a deformity of the supracardiac shadow or a shadow along the innominate artery due to dissection along this vessel Displacement of the esophagus and trachea to the right may occur [24]

The first case clearly demonstrates the two stages of dissecting aortic aneurysm. The first stage of symptoms, consisting of a choking sensation and temporary dyspnea without any physical signs, represented the stage of incomplete rupture of the aorta, and the second stage of dissection was indicated by excruciating pain in the lower back and abdomen, sudden appearance of an aortic diastolic murmur, peripheral changes characteristic of an aortic valvular insufficiency, acute occlusion of the right femoral artery, and sudden death due to external rupture of the aorta either intra-abdominally or intrapericardially

Mechanism for the Development of the Murmurs

The systolic murmur is due to the vibrations, caused by the blood stream, of the edges of the intimal tear [20] The intimal rupture almost always occurs in the ascending portion of the aortic arch, a few centimeters above the aortic cusps The aorta is anchored at this point by the thick bands of pericardium passing between the pulmonary artery and aorta and by the ductus arteriosus, giving rise to a fixed area The abrupt diastolic recoil when the aortic valves are closed converts the longitudinal force into a transverse one and a lateral stretching of the intrapericardial part of the aorta occurs [4]

At one time it was believed that the aortic diastolic murmur and peripheral phenomenon of aortic insufficiency were caused by the regurgitation of the blood into the aneurysmal sac [25] However, aortic diastolic murmurs may be present in cases showing no intimal tear, and here they are due to the disturbance of the aortic valve closure because of the medial hematoma near the commissures [26] If the intimal tears are transverse to the axis and near the valve commissures, these commissures loosen, and the corresponding cusp hangs at a lower level in the aortic ring than the unaffected one, giving rise to imperfect closure of the cusps and an aortic valvular insufficiency [20]

Prognosis

There is a general impression that dissecting aortic aneurysms are invariably and immediately fatal Shennan recorded survival for more than one year in 16 out of 300 cases [4] If the patient survives five weeks, a re-entry phenomenon has

is responsible for these findings However, no evidence for syphilis could be discovered Although the Wassermann and Kahn tests are negative in 30 per cent of the cases that show luetic aortitis at autopsy, it is estimated that in the presence of an aortic insufficiency these tests should be positive in at least 95 per cent of the necropsied cases if no recent antiluetic therapy had been received [3] Gouley and Anderson recently reported six cases of cardiac decompensation which were diagnosed as luetic aortic insufficiency because of the presence of diastolic and systolic murmurs over the aortic area [3] Two of the cases had a positive Wassermann Autopsy disclosed a chronic dissecting aneurysm of the aorta in each case, and not one case, even those with a positive Wassermann, showed any microscopic evidence of a luetic aortitis or luetic aortic insufficiency Four of the cases had double-barreled aortas which accounted for the longevity after the dissection

Pathology and Etiology

There is agreement that the basic pathology in nontraumatic dissecting aneurysms of the aorta is a cystic necrosis involving the middle and inner thirds of the medial coat [4] Erdheim considered the process to be an unusual accumulation of mucoid in the interlamellar spaces which caused at first a thinning and then dissolution of the lamellae with a confluence of the adjacent spaces to form large pools [5 6] Cellina, on the other hand, interpreted the formation of the cysts as due to a primary injury of the elastic lamella with a thinning, disintegration, and disappearance of this lamella [7]

There is, however, *no agreement as to the* causes or precipitating factors responsible for the cystic degeneration of the aortic media Changes in the vasa vasorum of the aorta have been advanced as possible causes by many investigators and denied by others [5 6 8–12] *The abnormalities* of the vasa vasorum may consist of an obliterative or degenerative process with rupture and a consequent medial hematoma [11] Pappenheimer and Van Glahn found that many cases of rheumatic fever showed changes in the aortic media which they interpreted as due to an interference of the blood supply [14] Adrenalin has been indicted because of its threefold action increasing the blood pressure,* because it is a muscle poison, and most important by causing an anemic necrosis through its action on the vasa vasorum.[15] Weisel found a medial degeneration in the peripheral vessels of patients dying of variform infectious diseases and concluded that medial cystic degeneration of the aorta was likewise caused by infection [16]

THE TOXICITY OF SODIUM FLUORIDE IN MAN

MAURICE M BLACK, M D , ISRAEL S KLEINER, M D , and HERMAN BOLKER, M D ,
Brooklyn, New York

(From the Department of Physiology and Biochemistry, New York Medical College)

THE recent use of fluoride and other glycolytic inhibitors in the treatment of malignant neoplasia, as well as the relation of fluoride to the problems of dental caries, have made pertinent a re-evaluation of fluoride toxicity [1 2] Most standard textbooks of pharmacology class sodium fluoride as a highly toxic agent, asserting that it produces visceral and capillary damage, as well as hemorrhagic nephritis It is claimed that chronic ingestion leads to impaired growth poor nutrition, enamel defects, and anemia As little as 0 5 Gm is said to have caused fatality in some cases [3] On the other hand there are numerous reports in the literature which would indicate that the continued administration of moderate doses of sodium fluoride to various experimental animals (and human beings) leads to no observable deleterious effects

Woakes treated 20 goiter patients with 10 to 80 mg of sodium fluoride daily for six months to two years without noting any ill effects [4] Schulz hypodermically injected adult rabbits with 10 to 40 mg of sodium fluoride daily for 25 days with no ill effects [5] Gettler and Ellerbrook fed each of two dogs 18 mg and 32 mg of sodium fluoride per Kg body weight, respectively, every day for two weeks, and analysis of the organs at the end of that time revealed no significant accumulation of fluorine in the internal organs [6] Sollmann reported that 8 mg per Kg of sodium fluoride for nine weeks caused no deleterious effect in rats while 15 to 150 mg per Kg caused progressive impairment of growth and food consumption with low mortality and no histologic lesions [7] Leake states that the minimal intravenous lethal dose in rabbits is 87 5 mg of sodium fluoride per Kg [8] De Eds has summarized the work in this field up to the year 1933 [9]

It is the purpose of this paper to report on the apparent lack of toxicity of sodium fluoride as found in a group of more than 70 patients who received relatively large doses over prolonged periods of time

Preliminary experiments on a few rabbits indicated that 34 mg of sodium fluoride per Kg when injected intravenously or intraperitoneally daily for ten days, were without apparent systemic or toxic effects Handler has determined the acute toxic dose for rabbits to be 250 mg per Kg when given intraperitoneally [10] The average daily dose administered to the patients in the work to be reported is 3 4 mg per Kg , i e , one-tenth the apparent safe dose for rabbits and one-seventieth the acute toxic dose for rabbits

Most of the patients in this series were suffering from malignant neoplastic disease and were being treated with the enzyme inhibitors as reported by Black, Kleiner and Bolker [11] The subjects varied from a group of leukemic children of three and a half to six years, to adults, including elderly individuals In the adult group, the average dose was 80 mg of sodium fluoride four times a day while the children s dose varied from 20 to 50 mg four times a day If taken alone sodium fluoride causes gastritis and regurgitation because of the formation of hydrofluoric acid in the stomach If it is given in combination with an amphoteric antacid or as an enteric coated tablet there is minimal gastrointestinal disturbance * † The periods of therapy in most cases were several months, although some of the cases received the medication for shorter periods

No evidence of systemic toxicity or parenchymatous damage which could be attributed to sodium fluoride has been observed, although many of these patients have received more than 27 Gm of sodium fluoride over a period of three months Studies of the following vital functions and criteria revealed no evidence of toxic effect, and in many cases improvement supervened as malignant neoplasia were controlled temporarily growth and development in children, eruption of permanent teeth, hematopoiesis, liver function, albumin-globulin ratio, level of cholesterol and sugar in the blood, and kidney function. In no case was there seen any evidence of mottling of teeth, even though two of the children experienced eruption of teeth during the treatment (permanent teeth in one case and deciduous teeth in the other) Postmortem examination in four cases showed no parenchymatous degeneration that could be attributed to fluoride toxicity

The only systemic effect of the fluoride therapy which has been noted is a tendency to a fall in

occurred with re-establishment of the circulation in 90 per cent of the cases This creates a double-barreled aorta Sixty-one of Shennan's cases showed this development Jones and Langley report two cases, one of which survived three years after the dissection and one that is well eight years after the x-ray diagnosis of the aortic lesion [27] Graham *records a survival* thirty years after the acute episode [28] Sailer's statistics indicate that 10 per cent of the cases undergo healing [1]

Summary and Conclusions

1 Two cases of dissecting aneurysms of the aorta are presented and clinical evidence offered to substantiate this conclusion

2 One case is presented as an incomplete rupture of the aorta (first stage), and this opinion is based upon the acute episode of severe substernal pain, shocklike picture, and sudden appearance of a diastolic murmur The other case is represented by the two stages incomplete rupture of the aorta followed by dissection of the aorta, as evidenced by the development of an aortic diastolic murmur, peripheral evidence of an aortic insufficiency, and the sudden occlusion of the right femoral artery

3 It is suggested that chronic ergotamine tartrate administration is a possible causative factor in the development of medial cystic necrosis in one case

4. If one were to choose the one most diagnostic sign for dissecting aortic aneurysm, the sudden appearance of an aortic diastolic murmur would be the most helpful

USE SMEAR TEST TO DIAGNOSE EARLY CANCER

Kidney cancer at a pregrowth stage has been detected by two cell experts using the diagnostic "smear" test for malignancy Writing in the Feb 5 issue of the *Journal of the American Medical Association*, George N Papanicolaou, M D , developer of the smear test, and his coworker, N Chandler Foot, M D , of the Cornell University Medical College Department of Anatomy, New York, say that they were able to identify the disease in a patient before the tiny cancer invaded surrounding tissue

Cancer in this early stage, called cancer *in situ*, often can be eradicated by prompt treatment Because the microscopic tumor is not revealed by x-ray photographs, and because the urinary tract is inaccessible to direct examination, cancer *in situ* of the kidney has been almost impossible to diagnose

Describing the smear test, Dr Papanicolaou says "Cells at the surface of the growth tend to be dislodged A technic for collecting the cellular debris, smearing it upon glass slides, and staining it has been perfected so that various components may be studied" The interpretation of the smear requires the services of a careful and discriminating cell specialist who has had experience in this field, Dr Papanicolaou emphasizes

After the kidney was removed, microscopic examination revealed small areas in which there was unmistakable evidence of cancerous change in the tissue, the physicians say, adding "For good results from surgery in the case of these highly malignant tumors, which have been found to be most refractory to surgical treatment, it is imperative that they be recognized *and removed* before they have become invasive and metastatic In the past this has proved to be almost impossible"

NONSPECIFIC REACTIONS IN SEROLOGIC TESTS FOR SYPHILIS—RELATIONSHIP OF VACCINIA

VICTOR N TOMPKINS, M D , Albany, New York

(From the Division of Laboratories and Research, New York State Department of Health)

REACTIONS in serologic tests for syphilis occasionally occur in diseases other than syphilis. There is no known serologic procedure for differentiating from syphilis the treponemal diseases such as yaws, bejel, and pinta In several of the diseases of the tropics—leprosy, malaria, schistosomiasis, and kala azar, for instance—false reactions frequently occur Of greater importance to physicians in New York State, however, are false reactions in infections of the respiratory tract, exanthematic diseases, infectious mononucleosis, and following smallpox vaccination. The vaccination against smallpox of large numbers of residents in New York State during the spring of 1947 presented an opportunity to study a few cases to determine the frequency of false reactions and the underlying conditions

False reactions following vaccination were first reported in 1940 by Barnard, who cites earlier observations by Giordano, and Moore, Eagle, and Mohr [1,2] Since Barnard's work, there have been several systematic surveys, perhaps the most extensive being that of Rein and Elsberg [3] A variety of tests were employed, including complement fixation and tube and slide precipitation tests Reactions occurred commonly in specimens from patients who had vaccinia or "primary takes," while in those from persons giving vaccinoid responses usually no reaction occurred In the successfully vaccinated cases, reactions occurred in increasing number throughout the first week, reaching a maximum in the second week, with a small number occurring in the third week Usually these reactions disappeared before the end of the fourth month Many were of relatively low titer, although most of the technics employed were qualitative The incidence varied from 14 to 54 per cent, depending on the time and the technic of testing

Little information is available on the influence of the antigen in tests of sera from vaccinated patients Andujar and coworkers and also Kline and his colleagues found that, with the Kline diagnostic precipitation test using cardiolipin antigen, no reactions occurred in eight cases, whereas two doubtful and two positive reactions occurred with the same test using lipoidal antigen [4,5] In the same eight cases, Andujar found one positive reaction in the Kolmer complement fixation test using cardiolipin antigen against three doubtful and two positive reactions using lipoidal antigen

Prior to the mass vaccination in New York in the spring of 1947, the Division of Laboratories and Research had performed its quantitative complement fixation test with specimens from approximately thirty cases of vaccinia [6] No reactions had occurred in these cases There was no evidence, therefore, that vaccination would result in an increasing number of reacting specimens It was not known, however, whether unusual cases would arise that would make interpretation of tests difficult Information was accordingly sought in two series of successfully vaccinated cases

One group consisted of 23 healthy people, members of the laboratory staff Sera were obtained fourteen days following successful vaccination Four tests were used in parallel (1) the New York State quantitative complement fixation test and (2) the quantitative tube precipitation test, both using cardiolipin antigen, were performed at the Central Laboratory under the direction of the originators of the respective methods [7] (3) A tube precipitation test of the same general class as the quantitative precipitation test was performed, using a lipoidal antigen for comparison This lipoidal antigen, long since replaced by cardiolipin, is the same as that used in the Washington Serology Conference of 1941 in the oversensitive preliminary procedure [8] (4) A slide precipitation test, at present under study, employing cardiolipin antigen, was also performed [9]

The results are shown in Table 1 No reactions occurred with the quantitative complement fixation test or with the quantitative tube pre-

TABLE 1.—REACTIONS IN TESTS OF SERA FROM 23 WELL PERSONS

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Public Health, Hygiene and Sanitation May 20 1948.

blood pressure, both systolic and diastolic This finding seems most marked in patients having pre-existent hypertension In view of these observations, fluoride was used in several cases of hypertension The doses employed were the same as in the cancer cases, and treatment was continued for several months The results obtained will not be reported here, except to emphasize the fact that no evidence of toxicity was found

An interesting opportunity to observe any effects on the mucous membranes of the colon was available in two patients who had functioning colostomies On no occasion was there any change in the healthy reddish appearance of the exposed mucosa The disintegration and apparent absorption of the enteric coated capsules was evidenced by the failure to find the capsules in the stool of any of the patients

The absorption of the orally administered fluoride was indicated by the therapeutic response obtained in various malignant neoplastic diseases This was well demonstrated in several cases of acute leukemia, where destruction of the malignant cells could be noted as early as twenty-four to forty-eight hours after starting treatment That this is a fluoride effect was confirmed in a case of acute myeloblastic leukemia which was given an intravenous infusion containing 600 mg of sodium fluoride in a liter of 10 per cent glucose in water The initial white blood count had been stable at approximately 20,000 per cu mm The next day the white blood count was 7,040 per cu mm, while the following day the count was 3,140 per cu mm

The intravenous route has been employed in many instances The following is the record of a typical case The patient was a sixteen-year-old girl suffering from an adrenal carcinoma Her weight was approximately 27 Kg at the time of treatment

In a period of nine days a consecutive total of 5,600 mg was given intravenously (Table 1) This is an average dose of 23 mg per Kg per day, with a maximum dose of 30 mg per Kg There were no signs of acute or chronic toxicity The patient expired two months later from the progression of the neoplasm Permission for autopsy was refused There were no signs or symptoms at any time that could be ascribed to fluoride toxicity

TABLE 1.—INTRAVENOUS ADMINISTRATION OF SODIUM FLUORIDE

Sodium Fluoride (Dose in Mg)	Method of Intravenous Injection	Clinical Effect
400	Infusion 2 L	None
800	2 direct injections (each 400 mg. in 20 cc)	None
800	Infusion in 500 cc	None
800	Infusion in 500 cc	None
800	Infusion in 500 cc	None
800	Infusion in 500 cc.	None
400	Direct injection	Local pain
0		
800	Direct injection	Local pain

In general the observations reported here are in accord with the results obtained by others using various experimental animals The popular conception of the extreme toxicity of sodium fluoride is not supported by these observations In a review of cancer therapy Woglom mentions fluoride as a potential chemotherapeutic agent only to eliminate it on the basis of its supposed toxicity It is our belief that this fear of fluorides is greatly magnified Normal tissue has a wide latitude of tolerance although certain malignant tissue is extremely sensitive to it It appears safe to say that within the doses indicated further study should not be deterred by fear of toxicity

Summary

The ingestion of 320 mg of sodium fluoride per day for periods of five to six months has not resulted in any evidence of acute or chronic toxicity in man Relatively high doses are also tolerated intravenously without deleterious effects Certain malignant tissue may show a greater sensitivity than normal tissue

PLATELET RESPONSE TO VITAMIN B COMPLEX IN THE NEWBORN PERIOD

Louis S Goldstein, M D , Yonkers, New York

(From the Yonkers Professional Hospital)

JAPANESE investigators carefully studied the platelet count in beriberi They reported that with clinical improvement the elevated platelet count frequently returned to normal [1]

In a recent case of congenital thiamin deficiency (infantile beriberi), thrombopenia, rather than an elevated platelet count, was observed On treatment with daily intramuscular injections of vitamin B complex, the platelet count gradually approached normal In view of the apparent increase in platelet count following specific therapy, it was decided to examine the relationship of vitamin B complex to platelet response in the newborn period

Apparently normal, newborn infants were selected for this study, regardless of gestation, sex, or birth weight Within twenty-four hours after birth, a group of ten newborn infants received daily intramuscular injections of $^1/_2$ cc of vitamin B complex (Betalin Complex-Lilly) for four days * Alternate infants received no therapy All infants received the routine nursery formula starting twelve hours after birth and consisting of $^2/_3$ whole cow's milk, $^1/_3$ boiled water, and 3 per cent granulated sugar

The method used for the counting of platelets is that described by Wood, Vogel, and Famulener, who used a 3 per cent solution of sodium citrate as the 1 100 diluent in a red cell pipet [2] The mixture is allowed to settle for ten minutes in the chamber before the counting is done With a high dry objective it is easy to recognize the unstained platelets At least 200 small squares must be counted [3]

Platelet counts were made from capillary blood taken from heel puncture Leslie and Sanford noted that the platelets are higher in venous plasma than in whole blood [4] This did not affect the present study, since I was not interested in specific counts, per se, but rather in the direction of fluctuation on the various days Davidson and Merritt and Lucas reported a physiologic drop in platelet count after the fourth day [5 6] This was confirmed in the control group (Table 1 and Fig 1) In direct contrast, the majority of infants who received daily injections of vitamin B complex showed a rise in platelet count on the fifth day (Table 2 and Fig 2)

Discussion

Ten apparently normal, newborn infants were used as controls to compare the response of an alternate group of ten normal newborn infants to injections of vitamin B complex Daily platelet counts were made Seven of the ten controls showed a drop in platelet count on the fifth day, whereas eight of the experimental group showed an increase in platelet count Further-

cipitation test using cardiolipin antigen. Five reactions occurred in the tube precipitation test with lipoidal antigen, subsequent specimens from these individuals failed to react in this test. Reactions occurred with four specimens in slide precipitation tests using cardiolipin antigen, all were from individuals whose specimens reacted with lipoidal antigen in the tube test.

The second series of tests was performed with specimens from hospitalized patients. Dr. Evan W. Thomas and Dr. Simeon Landy of Bellevue Hospital, New York, made available the sera from 54 nonsyphilitic patients with a variety of dermatologic ailments, all had been successfully vaccinated two weeks before testing. The quantitative complement fixation test and the quantitative tube precipitation test using cardiolipin antigen were performed at the Branch Laboratory of this Division in New York City, the three tests using lipoidal antigen were performed at Bellevue Hospital Laboratory. The results are presented in Table 2. In all instances where reactions occurred in any of the serologic tests, specimens collected subsequently failed to react.

In these two groups of cases it is not possible to make a satisfactory comparison of all the factors in the tests used. The tests differ among themselves in more respects than antigen alone. It appears, however, that the use of cardiolipin antigens results in greater specificity than is attained with lipoidal antigens. It is apparent, also, that the use of cardiolipin is, in itself, no guarantee that false reactions will be avoided. The use of cardiolipin with every technic does not confer perfection, the technics themselves apparently have limitations. Even in the quantitative complement fixation test, the most specific of the group presented, reactions of low titer occurred in a few sera from vaccinated individuals. This was found to be the case by Maltaner and Maltaner when they used an experimental thirty-minute period of fixation at 37 C. in parallel with the standard four hours at from 3 to 6 C., reactions of titer approximately 2 occurred at 37 C. but not with cold fixation.[6] This was confirmed in the present series.

The experience in New York City is consonant with the findings presented here.[10] The percentage of reacting sera during the period in which a large number of citizens were vaccinated was not larger than in the period preceding or following it. The results of tests in periods preceding and following show no influence attributable to the vaccination.

In summary, it appears that false reactions in serologic tests for syphilis, following vaccination against smallpox, are due to the reagents used and to technics of testing. Reactions are more common with lipoidal antigens than with cardiolipin antigens. They are more apt to occur in precipitation tests than in complement fixation tests. In the New York State quantitative complement fixation test with cardiolipin antigen, reactions are rare when the temperature of fixation is 3 to 6 C.

THE 98TH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION WILL BE HELD JUNE 6–10, 1949, IN ATLANTIC CITY, NEW JERSEY

PLATELET RESPONSE TO VITAMIN B COMPLEX IN THE NEWBORN PERIOD

Louis S Goldstein, M D , Yonkers, New York

(From the Yonkers Professional Hospital)

JAPANESE investigators carefully studied the platelet count in beriberi They reported that with clinical improvement the elevated platelet count frequently returned to normal [1]

In a recent case of congenital thiamin deficiency (infantile beriberi), thrombopenia, rather than an elevated platelet count, was observed On treatment with daily intramuscular injections of vitamin B complex, the platelet count gradually approached normal In view of the apparent increase in platelet count following specific therapy, it was decided to examine the relationship of vitamin B complex to platelet response in the newborn period

Apparently normal, newborn infants were selected for this study, regardless of gestation, sex, or birth weight Within twenty-four hours after birth, a group of ten newborn infants received daily intramuscular injections of 1/2 cc of vitamin B complex (Betalin Complex-Lilly) for four days * Alternate infants received no therapy All infants received the routine nursery formula starting twelve hours after birth and consisting of 2/3 whole cow's milk, 1/3 boiled water, and 3 per cent granulated sugar

The method used for the counting of platelets is that described by Wood, Vogel, and Famulener, who used a 3 per cent solution of sodium citrate as the 1 100 diluent in a red cell pipet [2] The mixture is allowed to settle for ten minutes in the chamber before the counting is done With a high dry objective it is easy to recognize the unstained platelets At least 200 small squares must be counted [3]

Platelet counts were made from capillary blood taken from heel puncture Leslie and Sanford noted that the platelets are higher in venous plasma than in whole blood [4] This did not affect the present study, since I was not interested in specific counts, per se, but rather in the direction of fluctuation on the various days Davidson and Merritt and Lucas reported a physiologic drop in platelet count after the fourth day [5 6] This was confirmed in the control group (Table 1 and Fig 1) In direct contrast, the majority of infants who received daily injections of vitamin B complex showed a rise in platelet count on the fifth day (Table 2 and Fig 2)

Discussion

Ten apparently normal, newborn infants were used as controls to compare the response of an alternate group of ten normal newborn infants to injections of vitamin B complex. Daily platelet counts were made Seven of the ten controls showed a drop in platelet count on the fifth day, whereas eight of the experimental group showed an increase in platelet count Further-

* Betalin Complex (Lilly)—each cubic centimeter contains thiamin chloride 5 mg riboflavin 2 mg nicotinamide 75 mg. pantothenic acid 2 5 mg. pyridoxine hydrochloride 5 mg. and phenol (as preservative) 0 5 per cent.

8th day	330	250	430	230	300		410		230	350
9th day	460		420	300	230	320				
10th day	510			450						

* To simplify tabulation only the first three numerals are used to represent thousands of platelets

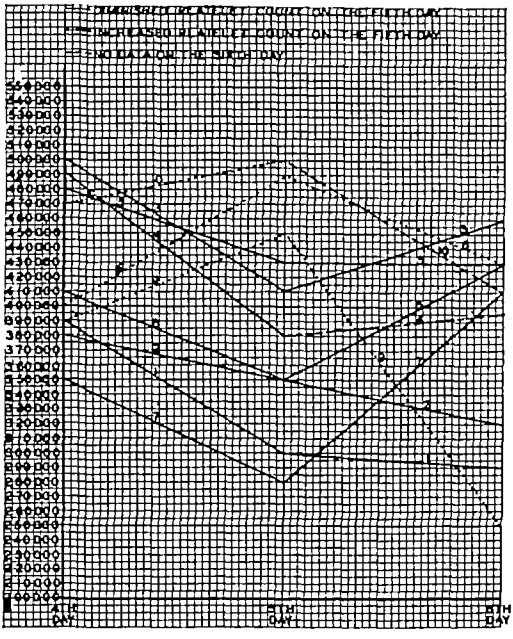

FIG 1 Controls

more, the highest platelet count on the fifth day in the control group was 430,000 platelets per cu mm, whereas in the experimental group the lowest platelet count on the fifth day was above 500,000 in one half of the cases, a figure greater than the highest counts in the control group

Conclusion

1 From the above numerical data and Table 2 and Fig 2 it is seen that vitamin B complex is responsible for a rise in platelet count on the fifth day in direct contrast to the controls who show a drop in platelet count (Table 1 and Fig 1)

2 It might be interesting to theorize on the questions Is congenital essential thrombopenic purpura due to vitamin B complex deficiency and can it be treated with specific therapy?

3 This study should be repeated using thiamin alone in view of Sumner's study of the platelet response to thiamin in the white rat [7]

THE ATLANTIC CITY SESSION

This year's annual meeting of the A.M A presents many features of great interest not only in the field of medicine itself, but in other matters which are closely related The proceedings of the House of Delegates are of special importance in view of the current problems which, in a sense, are assailing the American medical profession As stated in an editorial announcement (*J A M A*, April 23 1949), "The Atlantic City session will obviously be one of the most important held by the greatest medical organization in the world, and the decisions of that session will be vitally significant in determining the future of medicine in our country"

Those who can arrange to attend should do so!

Case Reports

CARCINOMA OF THE EXTRAHEPATIC BILE DUCTS

GEORGE M SAYPOL, M D , and BENJAMIN S FISHMAN, M D , New York City

(From the Departments of Surgery and Medicine, New York Post-Graduate Medical School and Hospital)

CARCINOMA of the extrahepatic bile ducts above the ampulla of Vater may be villous, annular, or diffuse in type The first two types, even though small, should not be difficult to recognize at operation, particularly if immediate cholangiography is performed The diffuse type, however, may easily be missed The extrahepatic ducts may be smooth and rigid without any evidence of encroachment upon the lumen by a circumscribed mass Immediate cholangiography is apt to show ducts of normal caliber and unobstructed flow of contrast media into the duodenum. Biopsy of the duct wall may be misleading if the section does not include an area invaded by tumor cells The diagnosis most likely to be made is benign fibrosis of the hepatic or common duct

The case to be presented was believed to be one of common duct fibrosis associated with cholelithiasis and cholangitis Two operations and gross examination of the organs at postmortem failed to reveal the diagnosis The latter was made only after careful study of microscopic sections of the bile ducts and other organs

Case Report

D B , a fifty-five-year-old white woman, was admitted April 15, 1947, with a history of right upper quadrant pain radiating to the scapula, increasing jaundice, itching, chills, fever to 104 F , and weight loss of 50 pounds during the preceding four weeks Stool was clay-colored, and urine was amber in appearance

Physical examination revealed a markedly icteric patient with evidence of recent weight loss and multiple scratch marks on the skin Liver was enlarged to three fingers below the right subcostal margin, the spleen was not felt.

Laboratory findings were as follows urine positive for bile, stool gray and negative for occult blood, white cell count was 16,250 with polymorphonuclear cells 84 per cent, icterus index 90 units, serum bilirubin 15 5 mg per cent, alkaline phosphatase 12 5 Bodansky units, cephalin-cholesterol flocculation 1 in twenty-four hours, total serum cholesterol 160 mg per cent, serum cholesterol esters 35 mg per cent, total serum proteins 5 1 Gm per cent, albumin-globulin ratio 1 6, and serum amylase normal Cholecystogram done just before admission was reported "no visualization " Gastrointestinal x-ray series was negative.

Course in the hospital for one week was characterized by persistence of abdominal pain, chills, and fever ranging between 98 and 104 F A diagnosis of chronic cholecystitis with cholelithiasis and choledocholithiasis or carcinoma of the head of the pancreas was made

Operation was performed on April 22, 1947, with the following findings The liver was enlarged, not nodular, and greenish brown. The gallbladder was shrunken, fibrotic, and adherent to the duodenum, hepatic flexure, and the greater omentum. It contained numerous stones of a mixed type. The common bile duct was about 6 mm. in diameter, thickened, and resembled an artery in consistency, it was patent and contained a few cubic centimeters of thick, tan bile. The ampulla was patent, admitting a probe with ease. There was no suspicion of ampullary or pancreatic tumor Cholecystectomy, choledochostomy, and liver biopsy were performed Pathologic report was chronic cholecystitis, cholelithiasis and biliary cirrhosis Culture of bile was reported positive for Escherichia coli Postoperative course was characterized by fever ranging between 99 and 104 F , bile drainage through and around the "T" tube, and persistence of E coli in the bile These were unrelieved by penicillin, streptomycin, and the sulfa drugs Cholangiograms on the fourteenth and sixtieth postoperative days revealed a patent, undilated common duct (Fig 1) By the fiftieth postoperative day bile drainage around the the tube had diminished considerably, and temperature range was between 99 and 103 F On the sixty-first day the "T" tube was removed, and on the

FIG 1 Cholangiogram taken on the fourteenth day after the first operation

FIG 2 Section of common bile duct showing invasion of nerve by carcinoma (105 ×)

FIG 3 Section of hepaticoduodenostomy (85 ×)

seventieth day the patient was discharged under continued observation

Laboratory findings at this time (July 2, 1947) were as follows icterus index 13 6 units, alkaline phosphatase 8 1 Bodansky units, cephalin-cholesterol flocculation 3 in twenty-four hours, thymol turbidity 9 units, total serum cholesterol 206 mg per cent, serum cholesterol esters 166 mg per cent, and total serum proteins 7 8 Gm per cent

On July 25, 1947, she was readmitted to the hospital (three months after her first operation) for incision and drainage of an abscess of the buttock resulting from intramuscular injections of liver extract There was still a small amount of bile draining from the abdominal sinus, and fever ranged between 99 and 102 F Laboratory studies at this time were icterus index 26 units, serum bilirubin 3 2 mg per cent, alkaline phosphatase 8 3 Bodansky units, cephalin-cholesterol flocculation 2 in twenty-four hours, thymol turbidity 6 units, total serum cholesterol 252 mg per cent, and serum cholesterol esters 181 mg per cent

She was discharged nine days later She continued to drain bile from the sinus, had spiking temperatures to 103 F , increasing jaundice, and right upper quadrant pain

On September 19, 1947, she was admitted to the hospital a third time (five months after her first operation) The liver was enlarged to five fingers below the right subcostal margin and the spleen was palpable Laboratory findings were icterus index 50 units, serum bilirubin 6 9 mg per cent, alkaline phosphatase 8 6 Bodansky units, cephalin-cholesterol flocculation 4 in twenty-four hours, thymol turbidity 12 units, total serum cholesterol 240 mg per cent, serum cholesterol esters 133 mg per cent, and total serum proteins 8 6 Gm. per cent

A cholangiogram was attempted by inserting a catheter into the biliary sinus and injecting diodrast The biliary tree did not outline, dye being observed only in the duodenum In order to rule out an overlooked stone or tumor of the common bile duct, another exploration was decided upon, and this was performed on October 10, 1947 The biliary sinus was followed down to the hilus of the liver where a pinpoint opening exuding bile was discovered Exploration of the hepatoduodenal ligament for study of the common duct proved fruitless The aforementioned opening at the hilus was dilated with the production of free bile, and an hepaticoduodenostomy over a "T" tube was performed The liver and spleen were enlarged There was no evidence of any tumor Culture of the bile was again positive for E coli Postoperatively, bile drained through the "T" tube and, around it, bile and duodenal contents Temperature ranged between 97 and 103 F She went progressively downhill and died November 18, 1947, one month after her last operation and seven months after her first operation The clinical diagnosis was chronic cholecystitis with cholelithiasis, cholangitis, biliary cirrhosis with splenomegaly, and fibrosing stenosis of the common bile duct associated with infection

Postmortem Microscopic Examination

Common Bile Duct —Section of the proximal portion of common duct shows only a small portion of recognizable mucosa Tumor is invading nerve trunks (Fig 2) Fibrous tissue is infiltrated with chronic inflammatory cells In one area there is necrosis of a tumor nodule with polymorphonuclear exudation In the wall of the duct is a lymph node containing a few tumor cells There is a dilatation

of sinusoids and proliferation of reticuloendothelial elements, many of which contain brown-yellow, granular pigment

Hepaticoduodenostomy —Section through the area of anastomosis of duodenum to hepatic duct shows the duodenal mucosa generally has undergone postmortem necrosis The deeper tissues show fibrosis and are infiltrated with chronic inflammatory cells and phagocytes laden with hemosiderin One large duct structure, seen as a longitudinal slit, probably represents a hepatic duct Scattered in the fibrous tissues are carcinomatous glands (Fig 3)

Liver —Section of liver shows a generalized necrosis affecting mainly the central two thirds of the lobule Disintegration of the cells is quite complete Yellow and brown intra- and intercellular pigment are present In the peripheral portion of the lobules there is a better preservation of tissue Brown pigment is present in liver and Kupfer cells A few bile plugs are noted Portal areas show fibrosis and a moderate bile duct proliferation A few chronic inflammatory cells are noted in the portal areas also

Peritoneum —Diaphragmatic, pelvic, and abdominal (region of cecum) peritoneum show invasion by scattered tumor cells

Final Diagnosis —Carcinoma of the common and hepatic bile ducts Secondary carcinoma of the peritoneum Biliary cirrhosis

PULMONARY BACILLUS PYOCYANEUS INFECTION IN AN ADULT WITH RECOVERY

Eugene Bifulco, M D , Hempstead, New York

(*From the Nassau Hospital, Mineola*)

SYSTEMIC Bacillus pyocyaneus infection may affect the extremes of life, from the fetus *in utero* to the adult [1] The occurrence of this fatal infection in infancy and childhood, usually manifested by necrotizing skin lesions and terminating invariably in septicemia, exemplifies the virulency of this organism in the early years of life [2] Its virulence is by no means obtunded in the adult, as attested by fatal cases of septicemia and endocarditis, there being only seven cases of the latter reported in the literature [3–8] Interestingly enough, a case of multiple liver abscesses from which a pure culture of B pyocyaneus was obtained was cured by surgical evacuation of the abscesses [7]

Frank pulmonary infections of B pyocyaneous are not common and are usually marked by a fulminating, rapidly fatal course Such was the experience in the cases reported by Soltmann, Clarke, Dudden, and Fraenkel, as quoted by Epstein and Grossman [2] It is interesting to note, however, that in a recent report by Frada a case of an adult with pulmonary B pyocyaneus infection simulating tuberculosis is recorded [8] This patient lived one year from the inception of her illness, finally dying in a cachectic state What the course of this case might have been if antibiotic agents had been available for therapy is now mere conjecture In the light of these facts it seems appropriate to report the following case of pulmonary B pyocyaneus infection with recovery following antibiotic therapy To my knowledge this is the first case of recovery recorded from this type of pulmonary infection

Case Report

A white man, aged fifty-five, was admitted via ambulance to the Nassau Hospital on May 20 1948 His chief complaint was difficulty in breathing of five years duration He dates the commencement of his present illness from a confinement at home for a period of five weeks in April and May, 1943, for a virus pneumonia' Following this confinement, till approximately one year ago, he endured a persistent dyspnea which remained unmodified by rest Despite the dyspnea he was able to continue as a fertilizer salesman till about June, 1947 During this latter month the dyspnea had progressed to the point where he had to discontinue his work and remain confined at home In October, 1947, he was hospitalized by his local physician for a period of two weeks During his hospitalization he was on a strict cardiac regimen of absolute bed rest, low sodium diet, digitalis, and mercuhydrin He was discharged slightly improved, but his dyspnea continued unabated From about the middle of March, 1948, till date of present admission he developed paroxysms of coughing which were usually terminated after the expectoration of a thick, tenacious plug of mucus During the week prior to date of present admission he was confined to absolute bed rest, using oxygen continuously, having more frequent paroxysms of severe coughing and expectorating about 20 cc of thick, grayish-green, mucopurulent material During this latter week the patient partook of very little food and fluids, and was very restless and obtained no relief from the continuous use of oxygen from nebulization of adrenalin 1 100 or Isuprel, and from aminophylline or papaverine * Demerol was finally resorted to with little benefit Patient's condition declined very rapidly, and finally permission for hospitalization was obtained when he was in a semidelirious state.

The past history reveals that twenty years ago he was operated for a rectal fistula but has since had a draining sinus on the right buttock Five years ago and again three years ago he was examined in a local

* Isuprel 1 (3 4 -dihydroxyphenyl) 2 isopropylaminoethanol hydrochloride

tuberculosis sanatorium Complete physical and laboratory examinations for tuberculosis proved negative

Examination on admission disclosed an acutely ill, thin, white male sitting in bed with a Boothby-Lovelace-Bulbulian mask in place, moaning and turning his head from side to side His color was cyanotic, despite the oxygen He was obviously having extreme difficulty breathing, and the accessory respiratory muscles were noted to be in active use To percussion the chest yielded hyperresonance over both lung fields On auscultation there were musical and wheezing rales throughout both lung fields with medium moist rales elicited at both bases The heart sounds were normal at the apex but were occluded by noisy respiration at the base The rate at the apex was 120 The pulse was full, regular, and at a rate of 120 The blood pressure in millimeters of mercury was 150 systolic and 100 diastolic Examination of the abdomen was negative About one and one-half inches above and to the right of the anus was a small draining sinus Rectal examination digitally revealed a normal prostate There was no evidence of dependent edema The temperature by rectum was 100 F and the respirations 35 per minute

On admission the hemoglobin was 13 5 Gm per 100 cc (90 per cent) A complete blood cell count was reported as follows red blood cells 5,050,000, white blood cells 18,700 of which 70 per cent were polymorphonuclears, 9 per cent stab cells, 17 per cent lymphocytes, 3 per cent monocytes, and 1 per cent eosinophils Two other complete cell counts done during his hospital stay disclosed practically the same findings with the exception of the white cell count which decreased to 15,000 cells A white cell count of 7,600 with a normal differential was obtained two months after discharge from the hospital Twenty-six eosinophils per 100 white blood cells were found in a specimen of sputum examined on May 25 Urinalysis and blood chemistry were normal Blood serology was negative X-ray examination of the lungs on May 21 was reported as showing exaggerated lung markings and fine infiltrations scattered throughout both lower lobes tending to coalesce at the bases, particularly on the left side Multiple adhesions were noted on both sides of the diaphragm and an enlarged node in the lower part of the right hilum Repeat x-ray examination on May 28 revealed definite decrease in lung markings and in the amount of infiltration at the bases The diaphragm was now completely smooth and regular and the enlarged hilar node noted before was now not evident X-ray of the chest prior to discharge on June 4 was interpreted as revealing moderate amount of fibrosis in the lower lung fields

The treatment instituted included continuous use of oxygen by Boothby-Lovelace-Bulbulian mask (patient could not be kept in an oxygen tent), antibiotics by aerosol, and other supportive measures The aerosol therapy consisted of penicillin, 300,000 units, and 0 3 Gm streptomycin daily, in three equally divided doses during a twenty-four hour period The dosage of the latter was increased to 0 6 Gm daily from May 30 until one week after discharge. During this week the aerosol therapy was continued at home

Bacterial culture of sputa collected on May 22 and May 25 were reported as pure cultures of B pyocyaneus However, the first culture showed a very heavy growth, whereas the second culture which was taken three days after aerosol therapy showed a very scant growth Another sputum obtained for bacterial culture on June 2 was reported as sterile A blood culture was reported as negative Bacterial culture of drainage from fecal fistula was reported as growing Staphylococcus aureus, Beta-hemolytic streptococcus and Escherichia coli

During the first four hospital days the patient's condition was critical The severe and frequent paroxysms of coughing were uncontrollable, the dyspnea was obdurate, expectoration amounted to approximately 20 cc of thick, grayish-green material daily, and his color continued cyanotic despite unabated use of oxygen His temperature ranged between normal and 100 5° F and the pulse rate between 110 and 130 In the period from May 25 to May 30, although the dyspnea persisted, his color improved, the paroxysms of coughing lessened in number, and a decided change in the quantity, consistency, and color of the sputa occurred The patient was now expectorating daily about 5 cc of thin, brownish colored sputum Patient still used oxygen continuously Examination of the chest at this time revealed hyperresonance to percussion throughout and medium moist rales at the lung bases on auscultation The wheezing and musical rales previously noted were conspicuously absent At this time aerosol streptomycin dosage was increased to 0 6 Gm daily From this time onward patient began to improve very rapidly On discharge date patient had not been using oxygen for three days, his color was good, appetite was normal, the dyspnea was decidedly improved, and subjectively he felt much better Examination of the chest at this time was essentially the same as the findings noted in the examination above Bed rest and aerosol therapy was continued at home for one more week. At the end of this period patient was breathing normally On examination the moist rales at the lung bases were no longer heard The temperature, pulse, and respirations were normal The patient was allowed out of bed During the next two months the patient gained over ten pounds in weight and has not experienced any respiratory difficulty He has now resumed working

Summary

A case of severe intrinsic asthma is presented The causative agent proved to be B pyocyaneus Complete recovery was effected by the use of aerosol streptomycin and penicillin

AFIBRINOGENEMIA OCCURRING IN A CASE OF MALIGNANCY OF THE PROSTATE WITH BONE METASTASES

MAXWELL MARDER, M D , MURRAY WEINER, M D , PHILIP SHULMAN, M D , and SHEPARD SHAPIRO, M D , New York City

(From the Second (Open) and the Third (New York University) Divisions of the Goldwater Memorial Hospital and the Department of Medicine, New York University College of Medicine)

DEFICIENCY of any one component of the blood coagulation mechanism may result in failure of blood to clot. Common examples are thrombocytopenia (thromboplastin?) and prothrombinopenia. A rare defect is lack of the fibrinogen content of the blood, and rarer still are cases of total absence of fibrinogen. The literature records 12 cases of congenital deficiency of fibrinogen, eight of which showed afibrinogenemia and three cases in which fibrinogen disappeared completely, or almost so, from the blood in the course of acquired disease [1-5]

The site of fibrinogen synthesis and its metabolic cycle is incompletely understood Recording the pathologic conditions in which fibrinogen disappears from the blood may yield data of value in understanding the manufacture of fibrinogen Accordingly, a case of acquired afibrinogenemia is being reported

Case Report

A seventy-two-year-old white man was admitted to the Goldwater Memorial Hospital on March 28, 1947, complaining of frequency of urination, pain over the right iliac crest and the right anterior rib cage, progressive weakness, anorexia, and loss of weight The prior history was noncontributory There was considerable mental obtundity so that system review and other phases of his history were almost unobtainable

In September, 1946, he had an attack of acute coronary thrombosis He was admitted to another hospital where it was noted that he had a tremor of the hands and tongue, ankylosis of the left knee, and a stony hard prostate enlarged to about double the average size Examination of the blood showed acid phosphatase 5 6 units (Gutman), hemoglobin 11 Gm., and erythrocytes 3,300,000 The stool guaiac test was negative Roentgenograms of the bony skeleton revealed no evidences of bone metastases After medication with stilbestrol the acid phosphatase became reduced to 3 7 units

Physical examination on admission revealed the following The appearance was that of a cachectic, elderly man with masklike facies of Parkinson's disease Fine tremors of the tongue and hands were evident. The pupils were slightly irregular and reacted to light and accommodation. The fundi were unremarkable There were a few scattered corneal opacities There were no retinal hemorrhages A few shotty cervical nodes could be felt There was marked tenderness to pressure over the right lower two ribs anteriorly and laterally The abdominal wall was thin, and the skin was loose The spleen and liver could not be felt The prostate was stony hard and about twice normal size There were no palpable nodules The deep tendon reflexes were normally active No pathologic reflexes were present. The diagnosis of malignancy of the prostate was made

Laboratory Findings.—The kidneys concentrated urine to specific gravity of 1 021 The urine was alkaline, showed a trace of protein, but no glucose or acetone Microscopically, a few red and white blood cells were seen The blood hemoglobin was 10 Gm , red blood cells 3,700,000, white blood cells 15,400, polymorphonuclears 70 per cent, staff cells 6 per cent, lymphocytes 27 per cent, and monocytes 3 per cent Blood urea nitrogen was 19 5 mg , glucose 82 mg per 100 ml. The erythrocyte sedimentation rate was normal, hematocrit was 36 per cent, Wassermann and Mazzini reactions were negative Acid phosphatase was 1 4 units (Gutman), alkaline phosphatase 5 4 units (King-Armstrong), total protein 6 74 Gm , and albumin 4.56 Gm per 100 ml

Clinical Course —Shortly after admission, pyuria with fever developed. Febrile temperature persisted despite sulfadiazine therapy At the end of the second week, the patient complained of pain in the right hip and iliac crest, and costovertebral tenderness was elicited on the left side Roentgenograms revealed no metastases in the chest cage at the time On the twenty-fifth hospital day, a large subconjunctival hemorrhage appeared in the left eye At that time the acid phosphatase was 14.5 units (Gutman) Roentgenograms of the bones showed marked sclerosis in the region of the left sacroiliac joint and a patchy moth-eaten area of destruction in the region of the iliac crest The twelfth dorsal and first lumbar vertebrae were collapsed Other bones were unremarkable Aspiration biopsy of the liver revealed normal liver architecture and no evidence of infiltration by tumor Sternal marrow aspiration yielded 22,000 nucleated cells per cu cm., with an increase in normoblasts (30 per cent) On the day following sternal puncture, bleeding occurred from the wound and was stopped with considerable difficulty The bleeding recurred some hours later, and at the same time oozing of blood appeared at the site of small pressure ulcers on the lower back and the posterior aspect of the right elbow The coagulation time (Lee-White) was twenty minutes Two days later, the prothrombin estimation showed no clotting after twelve minutes, in spite of 5 mg of vitamin K given parenterally on the previous day On this day, the patient's whole blood likewise failed to clot after several hours Since no clot formed even after the addition of calcium, the fibrinogen content of the plasma was considered to be zero on two determinations Total protein was 5 40 Gm., albumin 3 1 Gm , and platelet count 220,000 The ventricular rate became very rapid Bleeding was diffuse, including generalized purpura, hemothorax, and tarry stools The blood pressure fell to 75/45, air hunger appeared, and the patient succumbed. Transfusion of 1 L of plasma and 500 ml whole blood had been given without effect

The following tests were made on samples of blood, taken during the hemorrhagic period, to identify the defect in the coagulation mechanism

1 Coagulation time and prothrombin time estimation In neither case was an endpoint obtained

2 Attempt to determine fibrinogen content of patient's plasma No precipitate appeared after calcium chloride was added

3 Patient's fresh whole blood was allowed to stand for several hours No clotting occurred Pure fibrinogen was added, and clotting followed after several minutes

4 Fresh normal serum was added to normal plasma, both fresh and aged Clotting followed promptly This proved that the serum possessed thrombin activity The serum was then added to the patient's plasma No clot appeared Pure fibrinogen was added to this mixture, and a clot formed promptly

5 Calcium chloride and active thromboplastin were added to the patient's plasma No endpoint was obtained Fibrinogen was added and a clot formed within a few seconds Addition of fibrinogen to calcium chloride and active thromboplastin failed to yield a clot in the absence of plasma

The patient's plasma failed to clot on the addition of calcium chloride The addition of active serum likewise failed to produce a clot This indicated that the patient's plasma could not be clotted by thrombin The addition of fibrinogen to the mixture was followed by clotting This suggested that the failure of the blood to clot was due to the lack of fibrinogen Fibrinogen was added to the patient's unclotted blood, and a clot formed This proved that prothrombin was present and active in the patient's blood This experiment suggested also that anticoagulant effect was not a cause of clotting failure Additional proof that anticoagulant was not a factor was obtained when it was shown that the addition of patient's plasma to normal plasma did not inhibit the clotting ability of the latter Electrophoretic patterns were not made

Discussion

The liver plays an essential role in the elaboration of fibrinogen Hepatectomy or destruction of the liver parenchyma by toxic agents is followed by a progressive fall in fibrinogen Similarly, when the circulation through the liver is disturbed by Eck fistula and hepatic artery ligation, the production of fibrinogen becomes inhibited Clinical findings indicate that the process is more complex than experimental studies indicate In the cases of congenital afibrinogenemia described in the literature, there was no causative factor common to all the cases other than fibrinogen failure In several of the cases of congenital fibrinogen insufficiency, establishment of the function of fibrinogen production seemed to be delayed since fibrinogen first appeared in the blood several days after birth The infants were sustained by blood transfusions in the interval In others, fibrinogen production did not start at all, and death resulted from exsanguination There was no pathology, other than hemorrhage, common to these cases

Of the acquired cases the report by Jurgens and Trautwein and the one herein described have several features in common Both cases presented the same clinical picture carcinoma of the prostate, bone metastases, fibrinogen deficiency, and consequent hemorrhages In both cases the liver appeared to be normal The inference is that the controlling mechanism for fibrinogen production may rest somewhere outside of the liver and possibly in the myeloid system Although the liver biopsy in our case was normal, there might have been disease elsewhere in the hepatic tissue This is improbable because there were no clinical evidences of such a state and the prothrombin activity was found to be normal when fibrinogen was added to plasma

The pattern of hemorrhage in the case described is noteworthy At first bleeding arose only at the site of tissue damage, presumably in areas where the capillaries have been altered The deficiency of fibrinogen was responsible for the failure of the blood to clot In the absence of clotting capacity hemorrhage once initiated continued without abating Subsequently, extravasation of blood became universal even in parts exposed to no particular stress or damage It appears, therefore, that maintenance of the capillary walls throughout the body in a normal state of integrity demands normal coagulability of the blood and that continuation of a state of hypocoagulability is followed by permeability to blood on the part of the capillary wall The identical behavior is observed in instances of impaired coagulation from other causes—thrombocytopenia, hypoprothrombinemia, and excess anticoagulant in the circulating blood We have observed a striking example of this in another case of hypocoagulability occurring in a patient exhibiting thrombocytopenia induced by quinidine sensitivity Platelet counts revealed rapid disappearance of thrombocytes from the peripheral blood so that within one hour after the drug was administered, no platelets could be seen in wet or stained blood specimens About two hours later, bleeding from the gums started, and not until several hours after this did hemorrhage commence to appear in other parts of the body

We have seen three instances after single large doses of dicumarol in which the prothrombin time became prolonged to more than sixty minutes and no bleeding appeared Apparently, the short duration of the prothrombin deficiency was inadequate to impair capillary permeability to the formed elements of the blood

Summary

A case of acquired afibrinogenemia is described It occurred in a patient showing clinical evidences of malignancy of the prostate with metastases diffusely distributed throughout the bony system The liver seemed to be adequate The findings indicate that fibrinogen production may be halted by disturbances in extrahepatic tissues, possibly in the myeloid system.

MYOCARDIAL INFARCTION IN A TWENTY-FIVE-YEAR-OLD MALE

ISRAEL PINE, M D , Belle Harbor, New York

IT IS becoming increasingly apparent that a diagnosis of myocardial infarction must be entertained in all cases of precordial distress in spite of the youth of the patient Electrocardiographic study is essential. Shivelhood has very recently reported a case of myocardial infarction in a twelve-year-old diabetic boy [1] French and Dock have reported a considerable group of young soldiers who suffered myocardial infarction while serving in the armed forces.[2] White states that the age incidence of coronary thrombosis with cardiac infarction occurring in persons under thirty years of age is about 0 7 per cent, and he points out the unusual fact that it strikes the robust and apparently most masculine young man [3] This observation is particularly striking in the case reported

Case Report

M S, a twenty-five-year-old white male, was seen on October 6, 1947, complaining of a vague precordial discomfort which he had noted daily for the past three weeks No history of any unusual exertion or emotional stress could be obtained as having occurred immediately prior to the onset of the patient's illness However, about one month before the patient noted any precordial discomfort, he did engage in a swimming contest after which he felt unusually exhausted and nauseous but had no chest pain at that time He quickly recovered from this sense of exhaustion and nausea About four weeks later, he began to notice some precordial discomfort He stated that on arising each morning he was free from any distress but after being up and about for one to two hours the precordial discomfort would appear and last all day On close questioning he recalled that on two occasions he noted a fleeting pain in his left arm It should be noted that this vague discomfort in his left chest did not interfere with his daily routine which consisted of his attending collegiate classes in preparation for a teaching vocation

The patient had been a member of the armed forces and served without any physical disability In August, 1946, he passed a rigorous physical examination and he was certified as fit for flying duty The family history elicited the fact that a paternal grandfather had died of a "heart attack" at the age of fifty-five The past history was essentially negative as regards any previous illness It is, however, interesting to note that the patient had always been inclined toward athletics and frequently engaged in calisthenics on his own just to keep in trim.

Physical examination revealed a robust and athletic looking young adult male in no apparent distress The only positive findings were a mild hypertension to the extent of 150/100, and fluoroscopy showed a suggestive enlargement of the heart to the left

An electrocardiogram taken on October 6, 1947, revealed an acute posterior wall infarction with probable extension to the anterolateral surface of the left ventricle Subsequent electrocardiograms completely confirmed this diagnosis and showed the full evolution of an acute coronary process (Figs 1 and 2)

An analysis of the first electrocardiogram taken on October 6 reveals deeply inverted and symmetric T waves in leads 2 and 3 with diphasic T waves in V_5 No Q waves or S-T deviations were noted

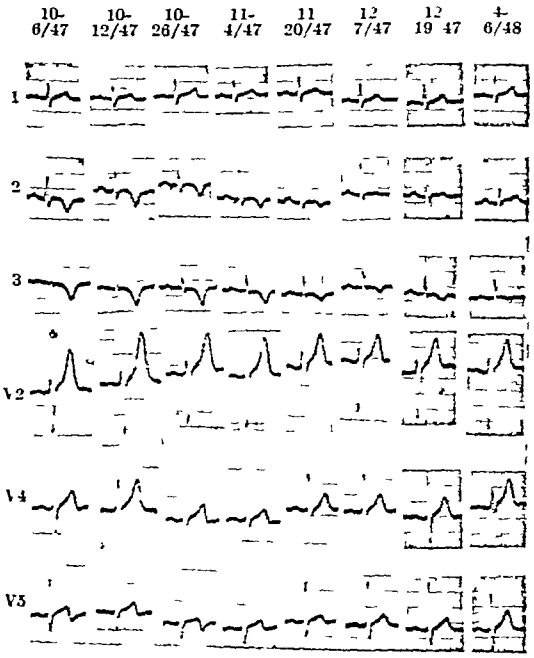

FIG 1 Serial electrocardiograms showing a posterior wall infarction T_2 and T_3 deeply inverted and symmetric with complete restitution to normal T in V_5 diphasic and then inverted also returned to normal and shows involvement of the anterolateral surface of the left ventricle

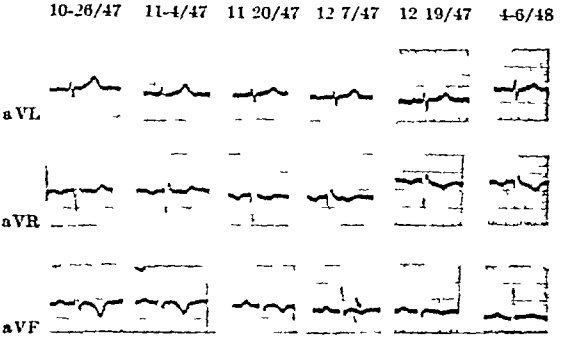

FIG 2 Augmented unipolar extremity leads T is deeply inverted and symmetric in the left leg lead (aVF) and is abnormally upright in the right arm lead (aVR) Restitution to normal takes place with T becoming upright in aVF and inverted in aVR

Katz has conveniently divided the evolution of the acute coronary electrocardiogram into four stages, namely, S-T stage, T waxing stage, T waning stage, and stabilized stage [4] In examining the first electrocardiogram it was impossible to determine whether we were dealing with stage 2 or 3 Subsequent electrocardiograms proved that we were in the T waxing stage as shown by the progressive deepening of the T waves in leads 2 and 3 As healing took place the T waves in these leads as well as the T waves in leads aVF and aVR returned to normal (Figs 1 and 2)

It should be noted that the sedimentation rate and white cell count were normal The rectal temperature never rose above 99 6 F

The clinical course was uneventful, and the patient made a complete recovery

Pathogenesis

It is interesting to speculate on the underlying pathogenesis of the infarction in this case Was this a case of coronary thrombosis with infarction, or was the infarction based upon an acute coronary insufficiency? The history of an exhausting physical exertion one month prior to the onset of precordial discomfort, the absence of Q waves in the electrocardiogram, and the complete return of the electrocardiogram to a normal pattern probably indicate that the infarction here was due to an acute coronary insufficiency which was initiated by strenuous competitive swimming in a contest which took place about four weeks prior to the onset of precordial discomfort

Summary

A case of myocardial infarction occurring in a robust, twenty-five-year-old male was discussed. A complete electrocardiographic evolution of the process was presented. The underlying pathogenesis of the infarction was probably based on an acute coronary insufficiency

CALIFORNIA BILL POINTS TO POLITICAL DOMINATION OF MEDICINE

California doctors will face a precarious and uncertain future if S 157, a bill which has been introduced in the California Senate, is enacted, points out an editorial in the April 9 issue of the *Journal of the American Medical Association* For a third time, Governor Warren is now advocating a compulsory health insurance program for California In a message to the legislature January 3, he claimed that millions of people in California cannot pay for adequate medical care "without crippling their finances and without depriving themselves of other things that are needed to raise a good American family" He urged legislative adoption of a system of "health insurance to which everyone contributes and through which everyone will receive benefits in time of sickness"

Shortly thereafter, a bill reputed to embody the governor's ideas, S 157, to enact the "California Pre-Pay Health Service Act," was introduced in the California Senate The program would be financed, in part, by compulsory payroll taxes, referred to as "contributions" imposed on employers and employes The existing Department of Employment and a newly created Health Service Authority would administer the act This authority would include the director of public health as chairman, the chief executive officer of the Department of Employment, three physicians, two representatives of labor, two representatives of employers, and one dentist, the last eight members being appointed by the governor An executive director of the authority would be appointed also by the governor but on nomination by the authority A medical advisory board, a hospital service advisory board and an advisory committee on postgraduate study would be established, all of which would have no other responsibilities than giving advice

The concluding article of the bill, Article 14, deals with penalties Unprofessional conduct calling for the revocation of his license is charged against a physician who fails to disclose any "material fact known to him to obtain any service or benefit provided under the act" Each physician who participates in the program will presumably have to determine at his peril what is or is not a material fact Failure to disclose by physicians and by others is also declared to be a misdemeanor, as is also willful violation of any rule or regulation promulgated or published to effectuate the program Scattered throughout the 20 pages of this bill are innumerable statements in which the authority is authorized by regulation to impose requirements Apparently any express and clear provision for hearings on these regulations or for their publication in any definite manner is not included, yet a violation of any one of these would constitute a criminal offense This is the application of the methods of the "police state" at their worst to dominate the practice of medicine politically While a beneficiary may utilize more expensive hospital accommodations than those supplied under the bill, by paying the difference in cost, if a beneficiary and a physician mutually agree that the fee for medical services set by the authority is inadequate and if an additional fee is accepted by the physician, except in the case of a beneficiary entitled to reimbursement only, the license of the physician is made subject to revocation California physicians would face a precarious and uncertain future if this preposterous bill were to be enacted into law

GIANT CELL TUMOR OF THE PATELLA ENCOUNTERED DURING TREATMENT FOR PATELLAR FRACTURE*

C EUGENE ERWAY, M D , and RUSSELL B ERICKSON, M D , Elmira and Buffalo, New York

(From the Veterans Administration Hospital, Batavia, and the Department of Orthopedic Surgery, University of Buffalo School of Medicine)

THE following case is of interest, because with repeated x-rays we were able to follow the progress of a recent fracture in a normal-sized, cystic patella over a three months period During this short time a marked multilocular cystic enlargement of the patella could be seen developing This proved to be a giant cell tumor of the patella

This presentation brings the number of giant cell tumors of the patella reported in the literature to 23 The twenty-second case was reported by Lantzounis in May, 1947 [1]

The literature has been well reviewed by Linde and Roemer [2, 3] Linde brought out the history of trauma associated with the majority of these tumors as a primal and accepted causative factor, but Roemer believes that because of the frequency of trauma to the patella in normal daily living it is of little significance Richards, Giberson, and King report a case of giant cell tumor of the patella with a pathologic fracture of the anterior cortex which was not associated with trauma [4] In the case presented below there were several episodes of trauma to the patella and following the last episode a stellate fracture of the posterior surface was discovered The x-ray of the patella on admission shows the stellate fracture lines and the early cystic changes (Fig 1) The x-ray taken three months later shows the rapid and marked multilocular cystic enlargement of the patella (Fig 2)

Case Report

B S, a white, male, twenty-four year-old, married premedical student, was admitted to the Veterans Hospital, Batavia, New York, on December 17, 1946, with the chief complaint of pain and swelling in the left knee with limited motion. The family and past history were noncontributory

The present illness began in March, 1946 when the patient first noticed pain in the left knee while playing basketball Following this he also began to notice pain even when walking up or down stairs He gave a history of having fallen on the left knee several times in the past while playing basketball and skiing but noticed no significant injury to the knee on these occasions During 1946, the knee gradually became more painful, and one week before admission the patient slipped on the ice and fell to the sidewalk, striking the left kneecap He stated that he felt something "snap" in the knee Following this the knee rapidly became swollen and acutely tender which prevented him from bearing any weight on his left leg The physician whom he had consulted in his home town had made a diagnosis of possible torn medial meniscus

The physical examination on admission showed a temperature of 98 F , pulse 80, respirations 20, and the blood pressure 110/70 The left knee was markedly swollen, and all movements at the knee joint were greatly limited and painful. There was no definite quadriceps atrophy noted. There was ten-

FIG 1 Oblique views of the patella on December 20, 1946, showing pathologic fracture lines extending through the cystic area

FIG 2 X-ray of the patella on March 21, 1947, showing the marked multilocular cystic enlargement

* Published with permission of the Chief Medical Director Department of Medicine and Surgery Veterans Administration, who assumes no responsibility for the opinions expressed or conclusions drawn by the authors.

derness along the anterior surface of the patella, but no erythema was present Aspiration returned 75 cc of both old and fresh blood The general examination was otherwise essentially normal

The laboratory examination showed an essentially normal complete blood count and urinalysis The Wassermann and Kahn tests were negative The coagulation time was five minutes and bleeding time two minutes

Roentgenograms of the left knee showed a stellate fracture of the posterior surface of the patella without displacement The fracture extended through an osteolytic area that had the appearance of a multilocular cyst There was no periosteal proliferation There was moderate soft tissue swelling beneath the quadriceps tendon X-rays of the right knee were normal

A diagnosis of fracture of the patella through a cystic area was made The cause of the cyst could not be determined with certainty, yet a history of previous injury in this region made it possible that the cyst might be due to bone absorption following damage to the blood supply A circular walking cast from the toes to upper thigh was applied, and the patient was allowed to return to college with instructions that he return in three to four weeks for follow-up study The patient returned in four weeks and stated that the knee had been comfortable while in the cast A repeat x-ray was taken with the cast removed and showed a diffuse decrease in density in the patella masking the cystic changes previously noted The fracture line was not visible There was some tenderness over the patella, and the knee was somewhat swollen On aspiration of the knee joint 50 cc of blood were obtained An elastic bandage was applied, and the patient was again allowed to return to college with the understanding that he was to report back in four to six weeks for additional follow-up studies

On March 21, 1947, the patient returned and stated that knee caused only moderate discomfort but continued to remain swollen At this time the patient had almost complete range of motion in the left knee An x-ray of the left knee at this time showed that the patella had expanded since the previous x-ray and contained a multilocular cyst that almost completely occupied the patella There was no evidence of new bone formation, but slight periosteal proliferation was seen along the anterior border A chest x-ray at this time was negative, as were x-rays of all the long bones Examination of the patella at this time showed it to be approximately 3/4 to 1 inch greater in width than the right patella Accurate measurement was impossible because of the moderate amount of swelling that was present in the left knee In the lower outer quadrant of the left patella there was a definite defect in the cortex that would admit the tip of the middle finger, and this area was quite tender The patella was freely movable and there were no other significant physical findings

A diagnosis of possible giant cell tumor of the patella was made On March 27, 1947, excision of the entire patella was carried out A half-moon incision was made with the convexity downward The quadriceps tendon was incised longitudinally over the patella which was then shelled out by sharp dissection leaving sufficient tendon for closure Because of the marked and persistent oozing caused by the increased vascularity around the knee, it was necessary to apply a tourniquet to the upper thigh during the operation The patella *in situ* showed a defect in the cortex, approximately 2 cm in diameter in the lower lateral aspect The tumor tissue seen

FIG 3 Coronal section through left patella showing tumor mass

through this defect was very vascular, spongy, and friable The portion of the quadriceps tendon overlying this defect was excised, and the remaining tendon was sutured in the midline without tension, using interrupted black silk sutures Following closure a well-padded elastic bandage dressing was applied The postoperative course was slow and uneventful On the fifth postoperative day 60 cc of bloody fluid were removed from the left knee joint. On the eighth postoperative day the patient was allowed up on crutches He continued with daily exercises and physiotherapy until his discharge May 6, 1947, on his thirty-ninth postoperative day, at which time he had only a 10-degree lack of full extension and only 30-degree lack of full flexion, but he continued to have a slight amount of swelling in the left knee

The pathologic report states that the somewhat enlarged patella specimen shows fused stellate fracture lines on the articular surface The anterior surface shows an irregular defect in the cortex measuring 1 5 by 2 cm. on the inferolateral aspect On coronal section the tumor mass appears to occupy approximately three-fourths of the enlarged patella. It is fleshy in appearance and trabeculated The cortex of the specimen is egg-shell in thickness along the lower pole and lateral aspect but shows an eccentric increased thickness over the superior pole (Fig 3)

Microscopic section shows a diffuse arrangement of fusiform, stellate and irregular cells with hyperchromic nuclei which lie in a reticular and partially collagenized matrix There is abundant lymphatic and capillary network Adjoining the lymph spaces and in some instances lying within them, there are numerous giant cells containing from three to 20 nuclei, the latter likewise being hyperchromic and bordered by homogeneous basophilic cytoplasm In most instances the giant cells resemble osteoclast aggressions, but a few with peripherally placed nuclei resemble Langhan's cells In spite of the hyperchromia of the nuclei and disorganization of the tumor tissue as a whole, the spindle cells give the impression of maturation tendency and the process is, therefore, considered to be a benign giant cell tumor (Fig 4)

The patient returned to the hospital on October 10, 1947, with the history that he had noticed a small gradually enlarging mass in the region of the left knee cap for the past two to three months Examination showed a nontender, freely movable mass, 2 cm in diameter, on the anterior surface of the left

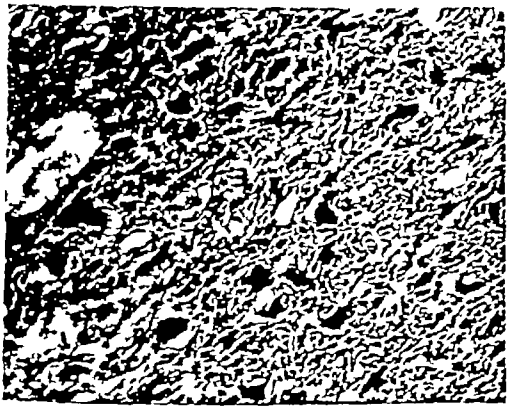

FIG 4 Low power magnification showing hyperchromatic multinucleated giant cells

knee There was practically complete range of flexion and extension at this time with no evidence of fluid in the knee joint

Roentgenograms of the left knee at this time showed no abnormality in the bones The patella was absent There was irregular ossification in the quadriceps tendon close to the previous position of the patella There was a large homogeneous soft tissue density in the anterior portion of the knee joint

On October 11, 1947, the tumor was re-excised, this time using electrocautery The postoperative course was uneventful. The pathologic picture at this time showed a mass, 2 cm. in diameter, which appeared circumscribed and encapsulated The surface was granular and nodular and of firm consistency Cut sections showed a coarse architecture of mottled grayish-brown color Microscopic examination showed a very cellular tumor with an abundant number of multinucleated giant cells similar in appearance to the microscopic sections from the original tumor

The patient was discharged from the hospital on October 24, 1947, and at the time of his last follow-up visit on June 8, 1948, he had no discomfort or limitation of movement in the right knee There was no increased fluid in the knee joint and no evidence of recurrence of the tumor either clinically or radiographically

Because of the benign nature of these tumors which have previously been termed myeloid sarcoma, giant cell sarcoma, osteoclastoma, etc Bloodgood in 1910 recommended the term giant cell tumor to describe these benign lesions [5] Giant cell tumor of the patella is a low-grade neoplastic process pursuing a prolonged and generally progressive course without metastasis Linde reports that, to date, no giant cell tumor of the patella has shown a malignant or metastatic behavior [2] Henry reported a case of giant cell tumor of the patella of several years duration with such extreme atrophy of the quadriceps that at the time of excision of the patella it was necessary to arthrodese the knee joint [6] Kraft presented a case of giant cell tumor of the patella that was lanced, and followed by raw oozing masses growing out of the skin incisions [7] This tumor was later excised and curetted with good results

In reviewing the cases presented in the literature it is found that the best results are obtained by early operative excision of the entire patella

Our patient's recurrence was first noticed about two or three months after the original excision It has now been eight months since the re-excision of the tumor, and there is no clinical nor radiographic evidence of recurrence to date It is likely that the entire patella tumor was incompletely excised at the first operation

Summary

1 A primary benign giant cell tumor of the patella with a pathologic stellate fracture of the posterior surface is reported

2 Patellar trauma which has been mentioned as a possible causative factor in nearly all of the previously reported cases is significantly present in this case

3 Review of the other reported cases indicates that giant cell tumors of the patella are benign but should be removed early by excision to avoid local extension Complete excision of the patella is the procedure of choice in producing the most satisfactory results

4 Re-excision of the tumor recurrence in our case has given a satisfactory result

STATE MEMBERSHIP INCREASES IN VOLUNTARY MEDICAL CARE PLANS

Membership increased more than 515,000 in the six voluntary medical care insurance plans approved by the Medical Society of the State of New York during 1948 and now exceeds 1,550,000, George P Farrell, director of the State Society's Bureau of Medical Care Insurance, announced recently

Benefits to members during 1948 were in excess of $5,727,000 as compared to $3,500,000 in 1947

These plans, often referred to as the "Doctors' Plans" or "Blue Shield Plans," are located in Albany, New York Utica, Rochester, Syracuse, and Buffalo and serve the entire State

Group enrollment is through place of employment and for those who do not qualify for group enrollment individual enrollment on a direct pay basis is an established policy in most of the plans

Consideration and study is now being given to a uniform contract which is to be offered by these local plans to groups throughout the State. This is expected greatly to increase membership

The people of New York State have accepted the voluntary principle of prepayment insurance against the costs of medical and surgical care and it is anticipated that 1949 enrollment will exceed 1948

SUBACUTE BACTERIAL ENDOCARDITIS

W D Stubenbord, M D , C A Webster, M D , and E J Van Slyck, M D , New York City

(From the Departments of Medicine, New York Hospital, Cornell University Medical College, and St Luke's Hospital)

IT HAS been stated that 90 to 95 per cent of the organisms causing subacute bacterial endocarditis belong to the nonhemolytic streptococci group [1] Of the remaining percentage, the Pfeiffer's bacillus, the Neisseria group, the influenza group, the Brucella group, Straphylococcus, pneumococcus and other organisms have been reported by Blum and by Thayer [2 3] Hunter and Duane reported a case of endocarditis due to a small gram-negative organism with characteristics placing it outside the Brucella, Hemophilus, Pasteurella, and bacteroid groups [4] This case was cured by the combined use of sulfadiazine and streptomycin Other reports of the use of streptomycin in the treatment of subacute bacterial endocarditis have been made by Priest and McGee [5]

The following case is reported, as it shows a cure of an unidentified gram-negative organism, treated with sulfadiazine and streptomycin

Case Report

R J , a forty-four-year-old white married woman, was admitted to the private patient's service of St Luke's Hospital with a history of nausea and right lower quadrant pain of one month's duration Although of an introspective and hypochondriac nature, she had been feeling well until about four weeks prior to admission, when she noticed the insidious onset of crampy right lower quadrant pain, accompanied by anorexia and nausea Food intake seemed to aggravate the abdominal pain and caused severe nausea, but no vomiting Her weight dropped from 105 pounds to 89 pounds in one month's time During the week before admission, she had been subsisting on fluids and boiled eggs A proctoscopic examination and a barium enema done before entering the hospital revealed no abnormal findings Her abdominal pain and nausea increased following the barium enema No rash, chills, or fever had been noted by the patient

During childhood she had rheumatic fever and for many years has been known to have a heart murmur She had a tonsillectomy when a young girl, and a combined bilateral salpingectomy and appendectomy in 1938 In 1946 a peritonsillar abscess was incised Except for slight dyspnea on exertion and chronic constipation her systemic review was negative Family history showed that her mother and sister died of cancer of the uterus

On admission, the following positive findings were revealed temperature 101 F , pulse 88, respiration 20, blood pressure 110/70 The patient was a well-developed, thin, pale, middle-aged female appearing chronically ill No petechiae were noted Her heart was enlarged to the left, with a heaving maximal impulse outside the midclavicular line in the fifth interspace There was a normal sinus rhythm with a rare premature beat A thrill was palpable over the point of maximal impulse, and a grade four rough systolic murmur was heard over the whole precordium, loudest at the apex, and preceded by a snapping first sound in the mitral area. Her abdomen was doughy in consistency, but neither the spleen nor other organs could be felt. Peristalsis was somewhat hyperactive A well-healed suprapubic midline scar was present. There were a few small varicosities on the lower extremities

The red blood cell count was 3,710,000 with 9 6 Gm of hemoglobin The white blood cell count was 14,000 with 76 per cent polymorphonuclears, 22 per cent lymphocytes, 1 per cent monocytes, 1 per cent eosinophils The urinalysis was negative The sedimentation rate (Westergren) was 79 mm. in one hour A stool examination was negative for occult blood A chest film showed moderate generalized enlargement of the heart, with prominence in the region of the left auricular appendage No accentuation of the pulmonary conus, nor any abnormality in the aorta, lungs, or diaphragm was noted. A gastrointestinal series revealed only a ptosis of an atonic stomach. A somewhat enlarged spleen was noted on a flat plate of the abdomen. An electrocardiogram showed a left axis deviation, otherwise a normal record A stool culture was negative for pathogenic organisms Agglutination tests for typhoid, paratyphoid A and B, Brucella, typhus, and tularemia were all negative

On admission, despite the fact that there were no petechiae, nor any evidence of embolic phenomena, the diagnosis of subacute bacterial endocarditis was considered most likely A blood culture taken on admission, and five subsequent cultures during the first week were negative On the third day, the spleen tip was palpable for the first time, and on the following day it was easily palpated. A petechial hemorrhage was noted in the left conjunctiva on the fourth hospital day, but it quickly disappeared Further petechiae appeared on the buccal and conjunctiva membranes in the following two weeks, during which time the patient ran a septic temperature

Treatment at first consisted of salicylates and codeine for relief of headache and abdominal pain, without a noticeable effect on the temperature curve These drugs were discontinued, because of the development of salicylism To combat the secondary anemia, two blood transfusions were given

By the eighth hospital day, despite the fact that all the blood cultures had shown no growth, it was felt that the patient should be treated for subacute bacterial endocarditis She was, therefore, given 50,000 units of penicillin every two hours, for eight days, and then 75,000 units every two hours for five days This was increased to 300,000 units every three hours for three days, but without any effect on the temperature The white count dropped from 14,000 to 6,000

A streptococcus sensitivity test, done on the thirteenth hospital day, showed an immune reaction which was interpreted as presumptive evidence of subacute bacterial endocarditis rather than active rheumatic fever A blood culture, drawn on the fourteenth hospital day, showed a growth twenty-three days later of a gram-negative bacillus This was the only positive culture obtained during the patient's entire hospital course The penicillin was stopped on the twenty-third hospital day in view of the blood culture report of a gram-negative

bacillus, and the patient was given a course of streptomycin (2 Gm. every three hours) and sulfadiazine (1 Gm. every four hours). The blood sulfa level, except for a few days early in the course, was maintained between 10·9 and 17·4 mg. Within twenty-four hours after starting this course of treatment, the temperature fell to normal and remained such thereafter, except for a brief spike to 100 on the thirty-fourth hospital day.

On the twenty-fifth hospital day, a raised, tender, slightly red area about 1 by 2 cm. appeared suddenly on the right palm and was interpreted as an Osler's node. A similar nodule appeared on the surface of the right thumb on the thirty-second day and disappeared a few days later. However, there were no other evidences of embolic phenomena. No toxic manifestations from streptomycin or sulfadiazine were noted. The course of streptomycin and sulfadiazine was continued for twenty-one days. Blood cultures taken at weekly intervals during this period were all negative. The patient improved rapidly, made an uneventful recovery, and was discharged forty-five days after admission. She was seen on several occasions following discharge and had gained weight and had no complaints.

The report of the bacteriologist, Dr. Margaret Upton, on the negative bacillus is as follows: A small gram-negative bacillus was isolated on only one occasion from the blood incubated in thioglycolate medium. The organism grew sparsely under strict anaerobiosis and under carbon dioxide but not aerobically. It would not grow except in the presence of blood, serum, or ascitic fluid. At first it was thought it might be Hemophilus parainfluenzae, but this was disproved at Dr. Alexander's laboratory at Babies Hospital in New York City. The organism did not belong to the Brucella group. The organism remained unidentified and was not recovered again. Although the isolated gram-negative organism was never definitely classified, there is no question that this was the cause of the disease. Penicillin in large doses given for at least two weeks time was ineffectual in altering the course of the disease. The response to streptomycin was dramatic. Within twenty-four hours the temperature fell to normal, the pulse rate became slower, and there was a decided improvement in the patient's general condition.

It seems reasonable to assume that this patient is cured. She has been well since January 5, 1948, the date of her discharge from the hospital. This illustrates the extreme value of streptomycin in the treatment of subacute bacterial endocarditis, a disease which until recent years was almost always fatal.

MILLIONS FOR TREATMENTS FAIL TO STOP ANNUAL HAIR FALL

Bald and balding American men are spending millions of dollars annually for futile hair-saving and dandruff-curing treatments, says a report of the American Medical Association Committee on Cosmetics in the March 26 issue of the *Journal of the American Medical Association*. Neither massage, mechanical devices, "tonics," ultraviolet light, hormones, vitamins, nor any other treatment will regenerate hair lost in ordinary baldness of older men or in premature baldness of young men, the committee emphasizes.

Although self-designated "hair and scalp specialists" or "trichologists" use high-sounding terms that connote scientific background and training, they are not physicians, and so far as can be determined, have no qualifications other than "a full head of hair, a business brain, and an appetite for easy money," the report says.

Use of preparations containing sulfa drugs not only may cause skin rash but may also preclude future use of the drugs if the person should require them for infection. Hormones are absorbed through the skin and in large enough amounts can cause systemic changes. Injection of vitamins into the scalp is a highly questionable and risky procedure and can have disastrous results.

Although the germ theory of dandruff is popular and is adroitly adjusted to the use of antiseptics in hair tonics, until an organism is proved to be the cause of dandruff and until a drug is found which kills or inhibits that specific organism, this type of advertising is supported only by supposition.

NATIONAL HEALTH SERVICE COSTS GREATLY EXCEED ESTIMATES

Costs of the National Health Service in England have greatly exceeded estimates, official figures just issued by the government show. Writing in the April 2 issue of the *Journal of the American Medical Association*, the regular London correspondent of the Journal says in part:

"All the undertakings of the socialist government show one thing with melancholy monotony—increased cost. The official figures, just issued, for the National Health Service are no exception. The cost of doctors is $118,000,000, an excess of $9,200,000 over the estimate. The cost of dentists is $82,800,000, an increase of $54,600,000. The cost of pharmacists is $70,860,000, an increase of $20,000,000 over the estimate. The cost of opticians is $57,800,000, an excess of $15,000,000 over the estimate. A large part of this vast expenditure is wasted, as is so characteristic of socialist finance."

Special Article

THE NEEDS OF THE ARMY MEDICAL SERVICE, II

COLONEL C J ST JOHN, First Army Surgeon, New York City

ONE of the most critical personnel problems of our national military establishment is that facing the Army Medical Department

If a shortage were allowed to develop, it could become a serious threat to the national defense program The Selective Service Act of 1948 provides that "no person shall be inducted until adequate provision shall have been made for medical care"

The Army and the Air Force will observe that provision They have achieved the highest medical, dental, and health standards in the world, and those standards will not be compromised under any circumstances Instead, the Army and the Air Force will intensify their efforts to obtain volunteers to fill their needs for professional people

In recognition of the gravity of this problem, and of the responsibility of the medical profession as one group to help meet it, the House of Delegates of the American Medical Association approved the following resolution at its annual convention in June, 1948

> *Resolved* That the State and County Medical Societies be urged by the action of the House of Delegates of the American Medical Association to exert every effort in their communities to ensure that a sufficient number of available physicians be encouraged to volunteer to serve their nation during this period of emergency

To meet this urgent problem, the Medical Department has developed a joint program in coordination with several of the national organizations which represent the professions involved This program is now in operation The program is organized to take advantage of the facilities of civilian Military Manpower Committees, which already have been set up in more than 600 cities and towns throughout the country These Committees work with the U S Army and U S Air Force Recruiting Service in mobilizing community support for the Volunteer Enlistment Program

Since the procurement of physicians, dentists, and other professional personnel cannot be conducted satisfactorily by laymen, this program calls for the organization of a subcommittee called the Professional Manpower Committee for each local Military Manpower Committee The Professional Manpower Committee is jointly headed by an outstanding local physician or surgeon and an outstanding dentist They are the local medical and dental professions' representatives on the Manpower Committee They work with the Manpower Committee chairman and representatives of the veterinary, nursing, and other allied professional associations to appoint a member from each group to the Professional Manpower Committee County or state medical and dental societies are being asked to nominate their professional representatives for the joint chairmanship of the Professional Manpower Committee

Members of the Professional Manpower Committee will be expected to serve as local spokesmen for the Army Medical Department and for their respective professions in contacts with local profession school students, interns, residents, and those professional people now engaged in practice Other functions can be suggested for them as the program develops.

A program kit and other printed material useful in setting up and operating the local program will be supplied to each Professional Manpower Committee by the Medical Department through the local U S Army and U S Air Force Recruiting Station

The success of the Professional Manpower Committee Program depends upon the wholehearted support and active cooperation of county and state medical societies It is hoped that the indispensable guidance and assistance only doctors can offer will now, as in the past, be brought to bear, enabling the Army Medical Department to meet its obligations to the people of the United States

The first article on this subject appeared in the May 1 issue of the JOURNAL page 1077

MEDICAL CARE DETERIORATES UNDER BRITISH HEALTH SYSTEM

British doctors under the National Health Service are so overworked treating trivial complaints that they do not have time to give satisfactory treatment to seriously ill patients, according to the regular London correspondent of the *Journal of the American Medical Association* In an item appearing in the March 5 issue of the *Journal*, the correspondent says that "demands on doctors' time by hypochondriacs and persons with trivial complaints, who throng their offices because treatment is free, render satisfactory work in cases of real illness difficult or impossible"

Patients demand prescriptions for self-diagnosed nonexistent complaints because this is cheaper than paying for a "cough cure" at the pharmacist's, and also pop in for a "thorough overhaul" because they have missed a train and have an hour to waste, he reports, adding "This is how the grand socialistic ideal of the Minister of Health, 'taking the money factor out of medical treatment,' works. All of these troubles of the National Health Service are the result of forcing such a complex thing as medical practice into the rigid framework of socialism"

SUMMARY OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

AT ITS meeting on March 10, 1949, the Council considered the following matters, taking action as indicated

Secretary's Report

Remission of Assessments —Remission of annual assessments was voted on account of service with the armed forces for 7 members for 1949, 11 for 1948, and 3 for 1947, one was rescinded On account of illness, annual assessments for 10 members were remitted for 1949 and 9 for 1948, also 33 War Memorial assessments were remitted on account of illness

Dr Simon D Ehrlich, New York County, was nominated for Associate Fellowship in the American Medical Association

Communications —A letter from Dr Charles H Loughran, secretary, Medical Society of the County of Kings, recommended that Alexander Gilligan, Joseph E Golding, Charles T Graham-Rogers, and George W Tong, who have passed the age of seventy, be nominated for retired membership and that their War Memorial assessments be remitted

It was voted that these recommendations be adopted.

It was voted that Dr Harold E Klein, of McLean, have the approval of the Council should he desire to transfer his membership to the Medical Society of the County of Cortland

A letter was also read from Mr Alan O Robinson, executive vice-president, The Yorkshire Indemnity Company of New York, expressing his appreciation for the resolution adopted at the February 10, 1949, Council meeting

A resolution passed by the Medical Society of the County of Kings disapproving the National Physicians Committee, February 15, 1949, was read for information

It was voted that a letter from Dr Harry Golembe of Liberty be answered by Mr Martin and Dr Anderton, stating (1) that the Medical Society of the State of New York has no policy regarding appointment of osteopathic physicians to hospital staffs, because conditions vary in different parts of the State, and (2) that the American College of Surgeons does not give its approval to hospitals that have osteopaths on their staffs

At the meeting of the Board of Trustees, February 10, 1949, an amount not to exceed $1,500 was voted to defray the expenses of Mr William Martin, counsel, and Mr H F Wanvig, authorized indemnity representative, to visit and study the methods of preventing malpractice law suits by the Alameda (California) County Medical Association

In spite of certain outspoken, antagonistic influences, this office has received many checks for the American Medical Association A week ago approximately 5,000 checks had been forwarded to Chicago Quite a number of letters and telephone calls regarding this assessment have been answered by your Secretary

Treasurer's Report was accepted

Report of the Executive Officer

Dr Hannon reported a hectic legislative session He stated that a number of bills had been introduced that were of interest to the State Society and a few had presented difficult problems, especially the Mahoney Bill in regard to narcotic addicts

Reports of Committees

Legislation —Dr Simpson introduced Mr John H Hanly, of the Federal Narcotic Control Later Dr Hollis Ingraham, of the State Health Department, addressed the Council Dr Simpson stated that the question at issue is simply this that our Conference of County Legislative Chairmen in Albany voted to oppose this bill The State Health Department apparently also opposes it Mr Hanly of the Federal Narcotics Bureau has given his view It is a matter for the Council to decide for Dr Hannon whether we shall uphold the action of the Legislative Chairmen of the County Societies in continuing to oppose this measure until such time as further study has been made, or whether we should rescind the motion of the County Legislative Chairmen in their recommendation to Dr Hannon

It was voted, in view of the information presented, that the Council reaffirms the position taken by the County Legislative Chairmen and sustains their action

Constitution and Bylaws —

It was voted to approve the proposed by laws of the Medical Society of the County of Albany with changes as recommended by Dr Reuling, chairman

Economics.—Dr Wertz, chairman, reported regarding meetings Mr Farrell, the director of the Bureau of Medical Care Insurance, had attended A meeting of the Subcommittee on Medical Expense Insurance and presidents or representatives of plans was held in the Society offices, February 25, 1949

After discussion,

It was voted (1) to accept in principle the recommendations of the Subcommittee, (2) to favor a contract with State-wide coverage offered by the various plans, and (3) that the Committee formulate such a contract on a service basis

Dr Wertz stated a letter and 10-point program from Dr Gilson Colby Engel, president of the Medical Society of the State of Pennsylvania, had been presented at the February Council meeting and was up for consideration today

After discussion,

It was voted to acknowledge Dr Engel's letter and to suggest that his program be revised to be in accord with the 12-point program of the A M A

Planning Committee for Medical Policies —Dr Kenney, chairman, reported that a subcommittee representing the Planning Committee and the Joint Council of Anesthesiologists, Pathologists, Roentgenologists, and Physical Therapy Physicians met with Deputy Attorney General Ruth Toch on February 21 and discussed the matter of medical services in hospital contracts

Publication —Dr Kosmak, chairman, reported that the *Directory* was being distributed

Public Health and Education.—A letter from Dr Post, acting chairman, explained the activities of the Committee

Dr Masterson, chairman of a Special Committee to Select a Chairman of the Committee on Public Health and Education, recommended that Dr Theodore J Curphey be appointed and that the office be moved to Nassau County

This was voted by the Council

Public Relations.—Dr Winslow, chairman, re-

ported the activities and immediate objectives of this Committee

Dr Winslow proposed the following resolution

WHEREAS, there are now before the Congress of the United States several bills embodying the principal of compulsory health insurance whose professed purpose is to provide a national health insurance and public health program, and

WHEREAS, it has been demonstrated in other countries that compulsory health insurance leads to the deterioration of standards of health, the quality of medical care, and the scientific medical facilities wherever it has been adopted, thus constituting a grave threat to the maintenance of the present high level of medical service which in the United States has become the best in the world under free enterprise, and

WHEREAS, compulsory health insurance would impair the relationship between doctor and patient, bring about the control of American medicine by a Federal bureaucracy, entail an undetermined payroll tax upon the wage earner and a concomitant drain upon the general revenue of unspecified proportions, and

WHEREAS, an extension of medical services to the American people can be provided without the adoption of compulsory health insurance through the expansion of facilities, research, health education, and similar measures as advocated in the 12-point program adopted by the American Medical Association, and the encouragement of voluntary prepaid medical care insurance plans which provide the public the opportunity to budget for the expenses of medical care without dictation by the government, now, therefore

Be it resolved by the members of the Council of the Medical Society of the State of New York

1 That they hereby go on record against any form of compulsory health insurance or any system of political medicine that is now or hereafter may be introduced before the Congress of the United States,

2 That a copy of this resolution be forwarded to the President of the United States, to each Senator and Representative from the State of New York, and that said Senators and Representatives be and are hereby respectfully requested to use every effort at their command to prevent the enactment of such legislation

It was voted unanimously that the above resolution be adopted

Office Administration and Policies—Dr Anderton reported that the Office Administration and Policies Committee recommends to the Council that membership records be under the joint jurisdiction of the Treasurer and Secretary of the Society

This was approved

Veterans Administration, Liaison with the—Dr Anderton reported for Dr Bauckus, chairman, that the Liaison Committee with the Veterans Administration met last evening for almost three hours

There was a discussion of certain fee changes in Part 2 of the schedule now considered part of the contract with Veterans Administration

A motion was passed by the Committee authorizing Dr Bauckus to discuss the disputed fees with Veterans Administration, also that Part 2 of the schedule be accepted as amended, pending decision on fees in dispute

It was also recommended that the Committee reserve the right to renegotiate disputed fees if not accepted by Veterans Administration, before any commitments are made

It was voted that the recommendations be approved.

Dr Anderton continued "There was a discussion of a directive sent out stating in part 'If appointive clerk, or group, or unit cannot accommodate veteran within two weeks, it will be considered hardship, and veteran will be referred to group chief who will determine kind and frequency of treatment, and may recommend to authorizing group who in turn will arrange for care by physician designated by Veterans Administration, with no privilege of selection by patient'

"It was moved and carried that a recommendation go to the Board of Directors disagreeing with this directive and urging that such practice be rescinded, and the matter referred to the Council."

It was voted that this recommendation be approved.

As a result of a letter to the Society from Senator Pepper inviting a representative to appear before the Subcommittee of the Committee on Labor and Public Welfare on Monday, March 21, at 11 A.M., it was proposed to send to Senator Pepper the following reply

> The Council of the Medical Society of the State of New York at its regular monthly meeting held here March 10 directed me to inform you that the Society is in favor of the proposed curtailment of the veterans hospital construction program so far as it relates to New York State, for the reason that existing facilities in veterans hospitals and general hospitals, together with the opportunity for medical care by veterans own personal physicians under the plan as set up in this State, are sufficient to make the best hospital and medical care available for veterans
>
> In view of our position on this matter, it is not considered necessary to send a representative to attend the public hearing on March 21
>
> Seventy-five copies of this letter are going to you today as our statement
>
> Very truly yours,
>
> W P ANDERTON, M D, *Secretary*
> Medical Society of the State of New York

It was voted that this communication and the report as a whole be approved

Woman's Auxiliary—Dr Beekman, chairman, read a letter sent to presidents of county auxiliaries by Mrs Edgar M Neptune, State Auxiliary president, entitled "American Medicine Is Faced with a Crisis"

Workmen's Compensation.—Dr Kenney, chairman, reported considerable unrest throughout the State relative to the fee schedule of June 1, 1947, for general practitioners, that his committee was working with the chairman of the Compensation Board, and that he hoped final interpretation of the disputed points would be ready before the House of Delegates meets

New Business

Renewal of Contracts for Mr Anderson.—Dr Masterson reported that Mr Dwight Anderson's contracts with the Society expire July 1 He moved that the Council recommend to the Trustees renewal under the same terms and conditions

This was voted

NECROLOGY

William Henry Beattie, M D , of Utica, died on April 19 at his home at the age of seventy-two Dr Beattie received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1903 and was former chief of staff of the Soldiers and Sailors Hospital, Utica, which is operated by the Grand Lodge of Masons of New York. Honorary ophthalmologist and otolaryngologist at St Elizabeth's Hospital, Utica, he was a member of the American Academy of Ophthalmology and Otolaryngology, the Utica Academy of Medicine, the New York State and Oneida County Medical Societies, and the American Medical Association.

Emelyn Lincoln Coolidge, M D , pediatrician and author, died April 14 at her home in New York City She was seventy-five Dr Coolidge attended Woman's Medical College in New York City and obtained her medical degree from Cornell University Medical College in 1900 She was formerly assistant superintendent, acting superintendent, and resident and visiting physician at Babies Hospital and pediatrician to the Society of the Lying-in Hospital.

Concurrently with her medical practice, Dr Coolidge engaged in writing activities, conducting the "Baby's Page" in the *Ladies' Home Journal* from 1902 to 1921, and serving as editor of the babies' department in the *Pictorial Review* from 1921 to 1937 She was the author of *How to Feed the Baby from Birth to Three, The Mother's Manual, First Aid in Nursery Ailments, The Home Care of Sick Children,* and *The Young Mother's Guide* She was a member of the Alumni Society of Babies Hospital.

Chester Charles Cott, M.D , of Buffalo, died on December 4, 1948, at the age of sixty-seven A graduate of the University of Buffalo Medical School in 1908, he was attending otolaryngologist at Buffalo General Hospital and consulting otologist at Meyer Memorial Hospital, Buffalo He was a member of the Buffalo Academy of Medicine, the American Academy of Ophthalmology and Otolaryngology, a fellow of the American College of Surgeons, and belonged to the New York State and Erie County Medical Societies and the American Medical Association.

Virginia Meriwether Davies, M.D , eighty-seven, a practicing physician for the last sixty-three years and said to have been the oldest practicing woman physician in New York State, died at her home in Conger on April 21 Dr Davies was graduated from the Medical College of the New York Infirmary in 1886, and for four years was head of the New York Infant Asylum. During the blizzard of 1888 she led a group who tunneled through an 18-foot snowdrift to get milk after supplies had been cut off for two days

In 1892 Dr Davies decided to retire from practice, and she and her husband purchased a farm in Congers She was soon drafted back into medical practice, however, by neighboring stone quarries, ice plants, brick yards, and other industrial plants, which had frequent accidents She finally opened a medical office at her farm, and continued her practice It was estimated that she had delivered more than 6,000 babies in her career

John Horni, M.D , Brooklyn, who retired in 1946 after fifty years of practice, died at his home April 18 at the age of seventy-five A graduate of the College of Physicians and Surgeons, Columbia University, in 1896, Dr Horni was consulting surgeon at Beth Moses Hospital, and attending surgeon at Bethany Deaconess Hospital He was a member of the Brooklyn Surgical Society, the Pan-American Medical Society, the Association of Physicians of Long Island, the Doctors' Club of Brooklyn, and was a fellow of the American College of Surgeons Dr Horni also belonged to the New York State and Kings County Medical Societies, and the American Medical Association

Myron Robinson Jackson, M.D , fifty-four, died on April 15 at his home in Oyster Bay of a heart attack, just after he had completed his visits to patients Dr Jackson was graduated from the Cornell University Medical College in 1932 and interned at Bellevue Hospital, after which he went to Oyster Bay and began his practice He was attending surgeon at the North Country Community Hospital, Glen Cove, where he had at one time served as chief of the surgical service, and was attending surgeon and gynecologist at Meadowbrook Hospital in East Hempstead

A fellow of the American College of Surgeons, Dr Jackson was a director of the Meadowbrook Hospital, a member of the Nassau County Surgical Society, the Nassau County Cancer Society, the New York State and Nassau County Medical Societies, and the American Medical Association

Phyllis Schuyler Kerr, M.D , White Plains, died April 12 at Doctors Hospital, New York City, after a long illness She was fifty-four A graduate of the Rush Medical College of Chicago in 1928, Dr Kerr interned at the Wisconsin General Hospital in Madison, and was a resident physician at the New York Post-Graduate Hospital from 1928 to 1940 She had been a practicing dermatologist in White Plains since 1936 and was clinical syphilologist and head of the women's health clinic for the Westchester County Department of Health

Dr Kerr was associate physician at the Tarrytown Hospital attending dermatologist at the White Plains Hospital, consulting dermatologist at the New York Hospital, Westchester Division, in White Plains, and attending dermatologist at Lawrence Hospital, Bronxville A diplomate of the American Board of Dermatology and Syphilology, she was a member of the Society of Investigative Dermatology, the Westchester Tuberculosis and Public Health Association, the New York State and Westchester County Medical Societies, and the American Medical Association

John Joseph McMahon, M.D , seventy-one, died suddenly of a heart attack on April 13 in New York City A graduate of the Toronto University Medical School in 1899, Dr McMahon would have completed fifty years of practice in New York City in June A fellow of the American College of Surgeons, he was consulting obstetrician at Misericordia Hospital, New York City, and St John's Hospital, Long Island City, and attending obstetrician at St Clare's Hospital, New York City He had formerly served as president of the medical board of St. John's Hospital and director of the hospital's obstetrics division Dr McMahon was a member of the New

York State and County Medical Societies and the American Medical Association

Vincent Joseph Moore, M D, Buffalo, died on November 19, 1948, at the age of fifty-two He was graduated from the University of Buffalo School of Medicine in 1923 and was attending radiologist at Mercy Hospital, Buffalo, and consulting radiologist at Adam Memorial Hospital, Perrysburg, and Our Lady of Victory Hospital, Lackawanna Dr Moore was a member of the Radiological Society of North America, the Buffalo Radiology Society, the Buffalo Academy of Medicine, the New York State and Erie County Medical Societies, and the American Medical Association

Robert Joseph O'Brien, M D, retired Watervliet physician, died on April 13, in Troy He was seventy-three A graduate of the Albany Medical College in 1904, Dr O'Brien served as chairman of the Watervliet draft board during World War II and was medical examiner for the draft board during World War I He was active in fraternal organizations and civic affairs

Irving Hotchkiss Pardee, M.D, fifty-seven, died on April 10 in New York City after a brief illness Dr Pardee received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1915, and interned at St Luke's Hospital and the Neurological Institute, Presbyterian Hospital Dr Pardee was attending neurologist at St Luke's Hospital, director of its neurological clinic, and secretary of the hospital's medical board, director of the service of neurology and attending neurologist at the Neurological Institute, Presbyterian Hospital, and professor of neurology and executive officer of the department of neurology at Columbia University He was consulting neurologist at the Hospital for Special Surgery, New York City, the Yonkers General Hospital, the Tuxedo Memorial Hospital, and the North Country Community Hospital, Glen Cove

During World War I, Dr Pardee was a lieutenant in the Medical Corps A former president of the New York Neurological Society and a former vice-president of the American Neurological Association, he was a member of the New York Academy of Medicine, the Association for Research in Nervous and Mental Diseases, the Association for Research in Internal Secretions, the New York State and County Medical Societies, and the American Medical Association, and was a diplomate of the American Board of Neurology and Psychiatry

Eugene Hillhouse Pool, M D, New York City surgeon, died at his home in Locust Valley on April 9 after a heart attack. He was seventy-five Dr Pool was graduated from the College of Physicians and Surgeons, Columbia University, in 1899, and joined the college staff in 1901, resigning in 1937 when he was clinical professor of surgery Before his retirement from practice in 1940, Dr Pool was professor of clinical surgery at the Cornell University Medical College, senior attending surgeon of the New York Hospital, and surgeon-in-chief emeritus at the Hospital for the Ruptured and Crippled, New York City

He was consulting surgeon at the following hospitals Presbyterian, French, Harlem, Woman's, the New York Infirmary for Women and Children, and the New York Eye and Ear Infirmary, all in New York City, the North Country Community, Glen Cove, the Elizabeth A Horton Memorial, Middletown, United, Port Chester, and the Central Islip State Hospital

Dr Pool served with the Army Medical Corps in World War I as a lieutenant colonel and was director of surgery in Army hospitals during the St Mihiel and Meuse-Argonne offensives For that work he was decorated with the Distinguished Service Medal In 1933 Governor Lehman appointed him chairman of a committee that studied medical abuses in connection with the administration of the Workmen's Compensation Law, and in 1934 the New York City Commissioner of Hospitals, Dr S S Goldwater, appointed him administrative consultant in surgery for all city hospitals

Dr Pool was inaugurated as president of the New York Academy of Medicine in 1935, and in 1936 was elected president of the American College of Surgeons A life trustee of Columbia University, he was awarded the Columbia University Alumni Federation's gold medal, in 1944, for distinguished contributions to the university Dr Pool was a fellow of the American College of Surgeons, and a member of the New York, American, and International Surgical Associations, the New York State and County Medical Societies, and the American Medical Association

Anna Martin Ralston, M.D, Brooklyn, died on March 10, 1949, at the age of seventy-three Dr Ralston was graduated from the New York Eclectic Medical College in 1896 and retired from active practice ten years ago She was a member of the New York State and Kings County Medical Societies, and the American Medical Association.

Thomas Avery Rogers, M D, seventy-six, of Plattsburg, died recently Dr Rogers was graduated from the Albany Medical College in 1896 and was honorary ophthalmologist and otolaryngologist at Champlain Valley and Physicians Hospitals in Plattsburg, and consulting physician at Dannemora State Hospital He was a member of the New York State and Clinton County Medical Societies, and of the American Medical Association

Leopold Miller Rohr, M D, Jamaica, a physician in New York for almost forty years, died April 6 in the Naval Hospital, St Albans, after a long illness He received his medical degree from the New York University and Bellevue Medical School in 1908 and became an inspector for the New York City Health Department in 1911 Later he was in charge of child hygiene in Brooklyn, chief medical supervisor, and a district health officer Dr Rohr was medical examiner and consultant of the Society for the Prevention of Cruelty to Children and a medical examiner for the Metropolitan Life Insurance Company During World War I he served with the Army Medical Corps as a captain and later was a colonel in the Medical Reserve Corps

Walter Howard Sanford, M D, died on December 13, 1948 A graduate of Albany Medical College in 1899, he was attending pathologist at Manhattan State Hospital, Wards Island

W Reynolds Shetterly, M D, Brooklyn, died on January 7 He was graduated from the Medical College of Ohio in 1890 and was consulting physician at the Lutheran Hospital of Manhattan He was a member of the New York State and Kings County Medical Societies and the American Medical Association

Alfred Wolff, M D, sixty-four, died February 22 in Brooklyn He was graduated from Heidelberg University in 1910 and was clinical assistant obstetrician and gynecologist at the Israel Zion Hospital Dispensary Dr Wolff was a member of the New York State and Kings County Medical Societies and the American Medical Association

MEDICAL NEWS

A M A Convenes June 6

THE ninety-eighth annual session of the American Medical Association will be held from June 6 through 10 in Atlantic City, New Jersey The House of Delegates will convene at 10 00 A M Monday, June 6

The Scientific Assembly of the Association will open with the General Scientific Meetings on Monday, June 6, starting at 2 00 P M and continuing through the morning and afternoon of June 7 The scientific sections will meet Wednesday Thursday, and Friday, June 8, 9, and 10 The Inauguration Meeting at which the president will be installed will be held on Tuesday, June 7

The Registration Bureau will be open from 8 30 A.M. to 5 30 P M , June 6 to 9, and from 8 30 to 12 NOON on June 10 The Bureau will be located in Convention Hall.

Especially significant at this session will be the television programs devoted to newer discoveries in the use of the roentgen ray and to surgical procedures

Among those taking part in the Scientific Assembly are the following New York physicians

General Scientific Meetings—Dr Howard A. Rusk, "Dynamic Approach to Chronic Disease."

Section on Internal Medicine—Dr Charles A. Ragan, "The General Management of Rheumatoid Arthritis", Dr Richard A Freyberg, 'The Present Status of Gold Therapy in Rheumatoid Arthritis"

Section on Surgery, General and Abdominal—Dr William F MacFee, "Painless Jaundice," Chairman's Address

Section on Obstetrics and Gynecology—Dr Joseph J Bunim, "Rheumatic Heart Disease in Pregnancy"

Section on Ophthalmology—Dr Daniel B Kirby 'The Use of Curare in Intraocular Surgery The Value of Curare for General Akinesia in Intraocular Surgery"

Section on Laryngology, Otology, and Rhinology—Dr Daniel S Cunning, "Diagnosis and Treatment of Laryngeal Tumors"

Section on Pediatrics—Dr John P Caffey, "Congenital Obstruction of the Alimentary Tract", Dr Charles Hendee Smith, "Evils of Thumb Sucking"

Section on Experimental Medicine and Therapeutics—Dr Walsh McDermott, "The Relation of Streptomycin Dosage to Toxicity and to Emergence of Resistant Organisms", Dr Randolph West, "The Treatment of Addisonian Pernicious Anemia with Vitamin B_{12}", Dr Harry Gold, "Some Observations on Digitoxin and Other Glycosides of the Digitalis Series."

Section on Pathology and Physiology—Drs Henry Horn and Leonard E Field, "The Pathology and Physiology of Acute Coronary Insufficiency", Dr Franklin M Hanger, "Diagnostic Problems in Jaundice."

Section on Nervous and Mental Diseases—Drs Lawrence I. Kaplan and Foster Kennedy, "The Effect of Head Posture on C S F Manometrics in Cervical Lesions A New Diagnostic Test", Dr Paul H. Hoch, "Theoretical Aspects of Prefrontal Lobotomy and Similar Operations", Dr Irving J Sands, "Practical Considerations in the Treatment of Mentally Ill"

Section on Dermatology and Syphilology—Dr Anthony C Cipollaro, "Dermatology and Syphilology in a Modern Medical Program," Chairman's Address, Dr L P Barker, "Rickettsialpox", Dr G M Lewis, "Antihistamine Therapy in Dermatology", Dr E F Traub, "The Benign Pigmented Epithelial Nevus"

Section on Preventive and Industrial Medicine and Public Health—Dr George A. Wright, "Disability Evaluation in Occupational Pulmonary Disease", Dr George M Wheatley "Why School Health Service?", Dr Herman E Hilleboe, 'The Exact Diagnosis of Pulmonary Tuberculosis"

Section on Urology—Dr J Sydney Ritter, "Vesical Neoplasms of the Female Bladder A Suggested Surgical Technic", Dr Herbert R. Kenyon, "The Technic for Immediate Diagnosis and Management of Vesical or Urethral Perforations in the Course of Transurethral Procedures"

Section on Orthopedic Surgery—Drs. Paul Strassburger C Zent Garber, and Halford Hallock, "Fibrous Dysplasia of Bone", Dr David M Bosworth, Chairman's Address, Dr Frederick M Smith, 'Injuries of the Medical Epicondyle of the Humerus", Drs Alan DeF Smith and Horace I Yu, "Streptomycin Combined with Surgery in the Treatment of Bone and Joint Tuberculosis"

Section on Gastroenterology and Proctology—Dr Edwin Boros, "The Role of the Esophagus in Local and Systemic Disease", Drs William J Grace, Stewart G Wolf, Jr , and Harold Wolff, "Changes in Colon Accompanying Varying Emotional States.'

Section on Radiology—Dr H Marks, "Eradication and/or Palliation of Advanced and Radioresistant Tumors by Multicentric Irradiation", Dr Anna Goldfeder, "Relative Radiosensitivities of Analogous Mammary Tumors"

Section on Anesthesiology—Dr David J Graubard, "The Use of Intravenous Procaine in the Management of Arthritis", Dr Clarence L Hebert "Complications of Spinal Anesthesia An Evaluation of Complications Encountered in 7,000 Patients"

Section on General Practice—Drs. Chester H Adams and Russell L. Cecil, "Results of Gold Therapy in Early Cases of Rheumatoid Arthritis", Drs Arthur M Master and Simon Dack, "Diagnosis and Treatment of Acute Coronary Diseases"

Section on Diseases of the Chest—Dr H McLeod Riggins, "Streptomycin and Dihydrostreptomycin in the Treatment of Tuberculosis", Dr Edgar Mayer, "Pulmonary Emphysema."

Session on Physical Medicine and Rehabilitation—Drs. Howard A. Rusk and Samuel S Sverdlik, "The Rehabilitation of Quadriplegics", Dr George G Deaver, "What Every Physician Should Know About the Teaching of Crutch Walking", Dr Hans Kraus, "What Every Physician Should Know About the Physical Treatment of Backache", Dr Robert C Darling, "What Every Physician Should Know About Physical Fitness", Dr Donald A Covalt, "What Every Physician Should Know About Physical Medicine and Rehabilitation for Industrial Injuries"

Session on Allergy—Dr Bret Ratner, "Asthma in Children Salient Diagnostic Problems"

Research Awards by American Heart Association

RESEARCH awards totaling $250,000 have been allocated by the American Heart Association to 26 investigators and six medical schools and hospitals for studies in heart and circulatory disease, it was announced recently by Mr A W Robertson, chairman of the board The awards included two to established investigators engaged in independent research, 24 research fellowships to younger scientists, six grants-in-aid to institutions, and provision of additional funds for basic research and cooperative research studies

The six grants-in-aid, totaling $46,210, include a grant to Syracuse University College of Medicine for study on the nervous and hormonal control of intrarenal blood flow, under the supervision of Dr O W Sartorius

Among those receiving the 25 research fellowships, totaling $103,800, in New York State were the following

George R Denton, Albany Medical College, surgery

L C Mark, New York University Research Service, Goldwater Memorial Hospital, cardiac arrhythmias

A Mascatello, Long Island College of Medicine pharmacology

L S Sommer, College of Physicians and Surgeons, Columbia University, physiology

A P Fishman, Mount Sinai Hospital, physiology

A G White, Montefiore Hospital, congestive heart failure

Brooklyn Opens First Nutrition Clinic

BROOKLYN recently acquired its first nutrition clinic to curb nutritional abnormalities in children

Dr Harry S Mustard, Health Commissioner, and the clinic's founder, Dr Norman Jolliffe, director of the Health Department's Bureau of Nutrition, joined civic and school representatives in dedicating the clinic in the Red Hook Gowanus District Health Center at 250 Baltic Street Describing the center as a great step forward in the preventive medicine program conducted by the Health Department, Dr Mustard announced that four more nutrition clinics would open in the coming year

Although designed primarily to serve children of low-income groups in the Red Hook and Gowanus areas of Brooklyn, Dr Jolliffe emphasized that the clinic would not be confined to them Individuals may be referred to the clinic through school health service, welfare agencies, private physicians, and other clinics, Dr Jolliffe said While low-income patients will receive treatment at the clinic, others will have reports sent back to their own physicians or other authorities

Clinic treatment will include a thorough medical examination, a chest x-ray, and special diet and laboratory tests Low-income bracket patients will receive follow-up treatment at the clinic

The clinic's services will be directed toward the school child and expectant mothers in the prenatal group, Dr Jolliffe added Prenatal care, he said, "goes hand in hand with nutrition"

Dr Jolliffe said that patients would be seen by appointment at the clinic, open on Mondays and Thursdays from 1 to 4 P M Dr Robert W Hillman is in charge.

Dr Jesse B Aronson, district health officer of the Red Hook Gowanus Health District, who presided, said visits to the child health station totaled 16,000 last year Cardiac cases doubled last year to nearly 3,000, while 10,500 persons made tuberculosis visits.

The next nutrition clinic will be opened at Amsterdam Houses on May 16, Dr Jolliffe announced.

MEDICALLY SPEAKING—

New York State Nurse Practice Act—It is now mandatory in New York State that all who nurse for hire must be licensed either as a registered professional nurse or a licensed practical nurse If any nurse anticipates working in New York State, she should make application for licensure *before* coming to the State Communications should be addressed to Miss Clara Quereau, Secretary, Board of Examiners of Nurses, Room 413, 23 South Pearl Street, Albany

Queens Physicians Division of United Jewish Appeal—More than $75,000 was collected at the annual dinner of the Queens Physicians Division of the United Jewish Appeal on April 21 at the Queens County Medical Society Building In announcing the total at the end of the dinner, Dr Elias Rubin, chairman of the Division, declared that other members of the profession throughout the borough would be given further opportunity to contribute during the course of the campaign.

One hundred and fifty Queens physicians listened with interest to the stories of heroism in war and peace told by Lt Azaria Rapoport, Israeli soldier and war correspondent, who participated in key battles with the Arabs

The vice-chairmen who assisted Dr Rubin in planning and carrying out the 1949 drive to date are Drs Albert J Aptaker, Julius Bleankfein, Daniel I Chillag, Moses Cohen, Samuel Dillon, Albert H Douglas, Harry H. Epstein, Arthur Feder, Henry I Fineberg, Arthur A Fischl, Harold Fruchter, Benjamin F Glasser, Sidney Hirsch, Daniel R. Kaufman, Harry L Kava, Samuel Klein, Allen Putterman, David M Raskind, Joseph Rosenthal, Louis I Siegel, Eugene S Spencer, Mandel Weinstein, David Warshaw, and Robert R Yanover

Compulsory Health Insurance Opposed by Catholics—The Truman Administration's national health insurance program would make health care "practically a Government monopoly," three prominent Roman Catholic welfare groups asserted last month in advancing an alternative plan

Patterned closely along lines proposed by the American Medical Association, this plan would commit the Federal government to spending about $2,150,000,000 a year in an effort to expand health care through broader enrollment in existing voluntary insurance systems

The Catholic program was put forth by the bureau of health and hospitals of the National Catholic

Welfare Conference, the National Conference of Catholic Charities, and the Catholic Hospital Association

A.M.A. Bureau Director Serves in Germany—Dr W W Bauer, Chicago, director of the American Medical Association Bureau of Health Education, sailed for Germany March 22 to consult with U S Military Government officials and with the German medical profession about the rehabilitation of postwar German medicine, especially with relation to public health and health education

Dr Bauer's services have been loaned by the American Medical Association to the U S Department of the Army He is scheduled to serve in Germany three months, returning by way of London, where he will spend a few days observing British health and medical systems

Speakers' "Briefing Sessions"—In order to provide assistance to doctors who are making public appearances in opposition to compulsory health insurance, the Committee on Public Relations of the New York State Medical Society scheduled two "briefing sessions," one on April 10 in New York City, and the other on May 14 in Rochester The meeting in New York, in the Hotel Commodore, was limited to representatives of county societies in the First, Second, Third, and Fourth District Branches The meeting in Rochester, in the Hotel Seneca, was for the remaining counties, attendance by invitation according to quotas based on population.

Professor Richard C Reager, of Rutgers University Department of Speech, conducted both sessions, placing emphasis on both the content of speeches and the manner of delivery

Due to the interest expressed by the State organizations of dentists and retail druggists in aiding the medical profession in its fight against government medicine, representatives of these organizations were also invited to attend.

Change in Regulations of the American Board of Orthopaedic Surgery, Inc.—A change in the regulations of the American Board of Orthopaedic Surgery, Inc , reads as follows

(2) Examination, Part I

(a) Eligibility for Examination, Part I Beginning in the year 1952 the minimum requirements for eligibility for examination, Part I, shall consist of completion of an internship, a year of resident training in general surgery, and *two* years of resident training in orthopaedic surgery on an approved service

Applicants filing in 1951 for examination, Part I, to be given in 1952 are subject to these minimum requirements

Public Relations Committees List Grows—The determination of the medical profession to organize its resources to combat compulsory health insurance is reflected in the number of county society public relations committees whose appointments have been reported to the State Society's executive offices There are now 29 such committees in the following counties Albany, Broome, Cayuga, Chenango, Clinton, Columbia, Cortland, Delaware, Dutchess, Jefferson, Madison, Monroe, Montomery, New York, Niagara, Oneida, Onondaga, Ontario, Orange, Putnam, Rensselaer, Rockland, Saratoga, Seneca, Steuben, Suffolk, Tompkins, Ulster, and Warren

In addition, there are seven county societies with executive personnel who function as public relations representatives The names of public relations committee members in any county not on the above list should be reported to the State Society

Federal Emergency Maternity and Infant Care Program—Physicians caring for, or who have previously cared for, patients under the Federal Emergency Maternity and Infant Care Program, are reminded that the program is to terminate completely on June 20, 1949

Under the regulations of the United States Children's Bureau, the New York State Department of Health has not been able to issue authorizations for maternity care since June 30, 1948 Health supervision to eligible infants was still provided under this program through April 19, 1949, and sick care may be provided if authorized on or before that date All requests for authorization for care for eligible infants must be received by the State Department of Health by May 19, 1949, as no authorizations may be issued after that date

The State Department of Health will be able to act upon requests for payment for services previously rendered for maternity or infant care until June 20, 1949 After this date the Federal funds available for such payments will be recalled, and no further payments can be made

Health and Welfare Division of Metropolitan Life Marks Anniversary—The year 1949 marks the fortieth anniversary of the Health and Welfare Division of the Metropolitan Life Insurance Company An anniversary report, *40 Years of Health Campaigning*, presents briefly some aspects of the Metropolitan's contribution to the outstanding results of forty years of cooperative public health effort by voluntary and official health and welfare agencies—for example, nearly a billion and a half health and safety pamphlets distributed, more than a hundred million nursing visits made to eligible policyholders, and Metropolitan's motion pictures shown to an audience of more than 147,000,000

New York County's "Minute Men"—Great progress in meeting demands for speakers against compulsory health insurance is being made by a group of New York County physicians who have banded together under the name of the "Minute Men." This group, consisting of volunteers from the county society, meets once a week to compare notes and polish up materials Enthusiasm is running high, and the results are becoming apparent

Dr Baumgartner Appointed to Federal Post—Dr Leona Baumgartner, assistant commissioner of health for New York City, has been named to succeed Dr Martha Eliot, deputy chief of the Federal Children's Bureau. The latter resigned after service of twenty-five years and will become assistant director-general of the World Health Organization with headquarters in Geneva. Dr Baumgartner will assume her new duties on June 1

Television Schedules Series on Research in Diseases of Childhood—Recent medical research aimed at the prevention and cure of childhood diseases will be the subject of a series of programs scheduled for Station WNBT and featuring Dr L Emmett Holt, Jr , professor of pediatrics, New York University College of Medicine, and director of the Children's Medical Service, Bellevue Hospital.

Accompanied by a group of staff doctors from the Department of Pediatrics of the College, Dr Holt will appear on "Meet the Experts," with Eloise McElhone as master of ceremonies, from 3 15 to 3 45 P M. on May 24 and June 7

Establishment of National Institute of Mental Health Announced—Establishment of a National Institute of Mental Health to intensify efforts toward the prevention, control, and treatment of mental illness was announced by Surgeon General Leonard A. Scheele of the Public Health Service, Federal Security Agency

The new institute, which was authorized by the 79th Congress, has been created in the National Institutes of Health, research branch of the Service It will continue the program formerly carried out by the Division of Mental Hygiene in the administration of the Mental Health Act of 1946 This program is specifically directed toward gaining more knowledge of the cause, prevention, and control of mental illness, training of personnel, and developing community mental health facilities

Dr Robert H Felix, chief of the division of Mental Hygiene since 1944, has been appointed director of the National Institute of Mental Health, and the Division of Mental Hygiene has been abolished

Blue Shield Growth Compares Favorably with Blue Cross in 1948—Net growth in 1948 for 46 Blue Shield Plans, which were coordinated with 55 Blue Cross Plans, reached a total of 2,699,909 members, as compared with a net growth of 2,501,134 members for the coordinated Blue Cross Plans Blue Shield Growth, for the Plans indicated above, was 107 95 per cent of the total credited to Blue Cross

Total net growth in 1948 for all nonprofit medical care plans reporting to Associated Medical Care Plans totaled 3,130,038, including enrollment figures from 71 Plans, which was 84 9 per cent of the net growth for 90 Blue Cross Plans, totaling 3,686,879 for the same period

Membership in the 46 Blue Shield Plans stood at 8,606,117 at the end of 1948, which was 35 44 per cent of the 24,281,579 members enrolled by the 55 Blue Cross Plans with which they were coordinated

Total membership for the 71 Plans reporting to Blue Shield was 10,367,464 at the end of 1948, which was 31 42 per cent of the 32,997,161 enrolled by 90 Blue Cross Plans

Conclusions drawn from the enrollment studies recently completed indicate a somewhat faster rate of growth for Blue Shield Plans which are coordinated with Blue Cross than for those which are not coordinated

New Public Relations Bureau Pamphlets Ready—Several new printed pamphlets, produced by the Public Relations Bureau of the State Medical Society, are now available for distribution in quantity to county societies and individual doctors

They are as follows *A Bitter Pill*—a brief, simple pamphlet stating the dangers of government medicine and the value of voluntary medical care insurance Produced for distribution to the public through doctors' offices and at public gatherings, *What People Are Writing to Their Congressmen*—a compilation of excerpts from letters protesting the compulsory health insurance principle These excerpts are offered as guides to persons who find it difficult to express their sentiments They should not be broadcast indiscriminately, but used where and when needed, two reprints from the New York *Daily News* *Uncle Sam, M D—Not Free, Not Cheap*, and *Dr John Bull* These editorial comments speak for themselves

Also ready for distribution are quick reference sheets that will enable any resident of New York State to determine the name and address of his representatives in Congress

Make known your wants by addressing the Public Relations Bureau, *Medical Society of the State of New York*, 292 Madison Ave , New York 17

Course in Diseases of the Cardiovascular System Offered—The New York Medical College, Flower and Fifth Avenue Hospitals, in conjunction with the New York State Department of Health and the New York City Department of Health, will present a short course in "Diseases of the Cardiovascular System" for general practitioners during the week of May 23, 1949 The course has been designed to assist the family physician in meeting the challenge presented to him by the increasing prevalence of cardiovascular diseases among his patients

Applications will be acceptable from physicians licensed by and living in the State of New York Since it is not feasible to give bedside instruction to large numbers, enrollment will be limited, and applications will be acted upon in the order of receipt No special application form is necessary Physicians interested in taking the course should so advise the Admissions Committee, New York Medical College, Flower and Fifth Avenue Hospitals, 1 East 105th Street, New York 29, enclosing a check for $3 00 payable to the New York Medical College, Flower and Fifth Avenue Hospitals This fee will be returned to applicants who cannot be accepted.

The New York State Department of Health will provide fellowships of $50 to cover the tuition fee for each accepted student In addition, the State Department of Health will allow a stipend of $10 per day to cover travel or living expenses to those students living 25 miles or more from the New York Medical College, Flower and Fifth Avenue Hospitals The only charge to the student is the registration fee.

Recent Legislation—Governor Dewey signed three bills on April 18 designed to aid children afflicted with cerebral palsy The first of the bills provides for the reporting of cases of cerebral palsy The second is devoted to the planning and financing of experimental programs in developing centers for the teaching of children afflicted with this condition and providing physical training for the rehabilitation of such children The third bill is aimed toward a rational administration of medical service and education for physically handicapped children "Hereafter the health and medical services will be administered by the Health Department and the educational services will be handled by the State Education Department Presently there is an illogical overlap," the Governor stated in a memorandum.

On April 24, coincident with the beginning of Mental Health Week in New York State, Mr Dewey signed a bill creating a commission to formulate a long-range master plan to meet the mental health needs of the State The new law creates in the Mental Hygiene Department a Mental Health Commission, headed by the State Commissioner of Health and including the Commissioners of Social Welfare, Health, Correction, and Education

Bampton Lectures in America—The second series of Bampton Lectures in America are being given by Dr Paul Ramsey Hawley, chief executive officer, Blue Cross Commission and Associated Medical Care Plans Dr Hawley's topic is "New Discoveries and Their Effect Upon the Public Health" The lectures are presented at the McMillin Academic Theater, 116th Street and Broadway, at 8 30 P M The dates of the last three lectures are May 16, 17, and 18

MEETINGS

Past

Saranac Lake Medical Society

Dr J Burns Amberson, chief of the Chest Service Bellevue Hospital, spoke on the "Potentialities and Treatment of Minimal Pulmonary Tuberculous Lesions" at a meeting of the Saranac Lake Medical Society on April 13

American Foundation for High Blood Pressure

The Medical Advisory Council of the recently formed American Foundation for High Blood Pressure held its annual meeting at the Hotel Cleveland, on April 15 and 16 Dr Irving H Page, Cleveland, is chairman of the Advisory Council which was formed in Cleveland in 1947

The following, among others, reported on their work Dr Raymond Gregory, University of Texas Medical Branch Galveston, Texas, Dr Eugene B Ferris, Jr, University of Cincinnati, College of Medicine, Cincinnati, Dr Robert Wilkins, Robert Dawson Evans Memorial Hospital Boston, Dr William Goldring New York University College of Medicine, New York City, and Dr Henry Schroeder, Washington University School of Medicine, St Louis.

Contin Society Honorary Scholastic Organization of New York Medical College

The twenty-fifth anniversary of the Contin Society Honorary Scholastic Organization of the New York Medical College was held on April 18 At this meeting, honorary membership was conferred upon Dr George T Pack who delivered the annual lecture, "Influence of Disease on History and the Course of Empires"

Other speakers of the evening were Dr J A. W Hetrick, president and dean New York Medical College, Dr I S Kleiner, professor of biochemistry and physiology, and Dr L P Wershub, associate, department of urology

In addition to the undergraduates who received the Honorary Scholastic Scroll for maintaining the scholastic standing in the upper *five per cent of the* junior year, many graduates were present representing a membership over a period of twenty-five years.

New York City Public Health Association

Dr Harry S Mustard, New York City Health Commissioner presided at a meeting of the New York City Public Health Association on April 19 Dr Leonard A Scheele *Surgeon General of the* U.S Public Health Service, discussed 'Current Trends in Public Health Organization in the United States" Dr Iago Galdston, executive secretary of the medical information committee of the New York Academy of Medicine and president of the Association, also spoke.

New York Council of Mental Health Organization

A forum sponsored by the New York Council of Mental Health Organization was held on April 22 at Washington Irving High School. The main topic was psychologic problems of the emotionally disturbed retarded, or maladjusted Dr Joseph S A Miller, medical director of Hillside Hospital, discussed the effects on the family, and Mr Edward Moses, psychologist with the Bureau of Child Hygiene, spoke on such problems in the public school

New York Council of Surgeons

Dr Charles Kastenbaum, visiting physician, St Joseph's Hospital for Diseases of the Chest, spoke on 'The Therapeutic Indication for Streptomycin in Pulmonary Tuberculosis" at a meeting of the New York Council of Surgeons on April 26

Association for the Advancement of Psychotherapy

A regular monthly meeting of the Association for the Advancement of Psychotherapy was held at the New York Academy of Medicine on April 29 The guest speaker was Dr Frederic Wertham, who spoke on "Psychopathology of Violence"

New York Allergy Society

A series of case presentations was the program of a meeting of the New York Allergy Society on May 4 The case presentations and discussers were as follows

Drs Louis J Schloss and Robert Chobot, University Hospital, New York University-Bellevue Medical Center, "Report of Death in Four and One *Half Year Asthmatic Child*"

Dr William B Sherman, Presbyterian Hospital, "A Case of Coexistent Insulin Allergy and Insulin *Resistance*"

Dr Francis C Lowell Boston "Clinical and Experimental Studies of Insulin Allergy and Resistance."

Dr Maury D Sanger, Brooklyn Regional Office Veterans Administration, "An Unusual Case of Severe Eczema Solare."

Dr David Merksamer Jewish Hospital, Brooklyn, "Atmospheric Mold Survey of the New York Metropolitan Area for 1948"

Dr Frederic P McIntyre, Flower and Fifth Avenue Hospitals, "An Unusual Case of Periarteritis Nodosa with Recovery"

Future

Cancer Teaching Day

A Cancer Teaching Day will be held at the Binghamton City Hospital, Binghamton, on May 25, under the auspices of the Broome County and New York State Medical Societies, the Sixth District Branch of the State Medical Society, the Binghamton City Department of Health, and the New York State Department of Health, Bureau of Cancer Control

HOSPITAL NEWS

New York's Blue Cross Plan Reports New High in Membership

ENROLLMENT of 420,143 persons in Associated Hospital Service, New York's Blue Cross Plan during 1948 brought the total membership to 626,321, Mr Louis H Pink, president, announced in the annual report for 1948

A total of $32,720,142 80 was paid to hospitals for the care of 356,904 members With the exception of maternity cases, 92 per cent of those who received care in semiprivate accommodations had their hospital bills paid in full The amount paid to hospitals from the time AHS was founded in 1935 to the end of 1948 totaled $140,675,907 72

The report showed that women and children made up approximately two thirds of the membership and three fourths of the cases hospitalized Men required less hospital care in proportion to the number enrolled, representing one third of the total membership but less than one fourth of the cases hospitalized.

Employed members originally outnumbered family dependents The trend began to reverse in 1945, however, and since that time the percentage of family members has steadily increased

The report indicated that increasing hospitalization among family dependents has resulted in greater expenditures for their care AHS provides full benefits for family dependents without additional membership charge regardless of the number of dependents enrolled in a family

Of the total number of members hospitalized, 176,545, or more than half, underwent surgery including tonsillectomies, tumors, and operations of the digestive and genitourinary system Medical cases, including respiratory, digestive, urinary, and circulatory diseases, numbered 101,540 A total of 78,819 were hospitalized for maternity and related conditions The average length of stay in the hospital was 8 7 days, slightly less than in 1947

Sixteen Municipal Hospitals Named as Participating Hospitals

IN ITS April report, the Hospital Council of Greater New York announced developments in the Master Plan for Hospitals and Related Facilities, which marked its second anniversary on April 22. Commenting on the Master Plan, Dr John B Pastore, executive director of the Council, stated, "The people of New York City have every reason to be proud of their community leaders and hospital authorities, who have voluntarily assumed the responsibility of working together to provide coordinated and efficient hospital and health facilities It is gratifying to the Council that no major hospital project has been undertaken during these last two years which was not in accord with the Master Plan

"Seventeen hospitals have already been named as Participating Hospitals Now we announce the designation of sixteen municipal and four voluntary institutions as Participating Hospitals, making a total of 37 Participating Hospitals over the two-year period The designation of these municipal hospitals is significant, in that it marks the joining of the municipal hospitals with the other hospitals serving the community in a common effort—that of creating, through the medium of the Hospital Council, a coordinated plan of essential hospital service"

The April Council *Bulletin* announced the designation of the following municipal institutions as Participating Hospitals Bellevue, Harlem, Metropolitan, Sydenham, Fordham, Lincoln, Morrisania, Coney Island, Cumberland, Greenpoint, Kings County, Queens General, New York City, Goldwater Memorial, Triboro, and Seton Also announced as Participating Hospitals were four voluntary hospitals Lebanon, Bronx, Mary Immaculate, and Jewish Memorial

REVIEWED

Medicine as a Profession. Talks with Medical Students By George Henry Murphy, M D Duodecimo of 74 pages Toronto, Ryerson Press, 1946 Cloth, $1 50

The author's background, both in medicine and the humanities, fully qualifies him to give "six talks" to medical students These talks represent the contents of this small volume of seventy-four pages. The advice is sound and frequently inspiring, but a talk of twelve pages at one sitting must, toward its termination test the student s endurance. And quoting from the book—"Advice gets wearisome, etc " All in all, however, the student given the opportunity to *read* these "six talks" at his leisure, will certainly profit therefrom.

S R. Blatteis

Medicine By A. E Clark-Kennedy, M D Vol I **The Patient and His Disease** Octavo of 383 pages Baltimore Williams & Wilkins Co , 1947 Cloth, $6 00

In the preface of this original approach to medicine, the author stresses the unfortunate increase in size of most modern textbooks as well as their lack of unity He says, too, that "the capacity of the human mind does not increase and keep pace" with knowledge, so that memory is strained to the breaking point and principles are crowded out or buried

This volume is a good attempt to stress principles from which other information can be deduced, thus putting less strain on the memory In addition, side by side with scientific data on disease, one finds correlative remarks on the patient as a person with his varied emotional problems

This book is warmly recommended as an admirable, helpful attempt to give a broader view of sick patients rather than diseased states per se.

Andrew Babey

Biology of Disease By Eli Moschcowitz, M D Quarto of 221 pages, illustrated New York, Grune & Stratton, 1948 Cloth, $4 50

Dr Moschcowitz has compiled several of his papers that have previously appeared in current medical magazines

The author s views on the biology of disease states and their evolution from early states to the morbid phase are scholarly

The biology charts that illustrate each subject constitute an excellent summary

Harry Mandelbaum

What You Can Do for High Blood Pressure By Peter J Steincrohn, M D Duodecimo of 191 pages Garden City, New York, Doubleday & Co , 1947 Cloth, $2 50

This small volume, written primarily for the layman, can with great profit include many members of the profession The author does his level best to drive home the fact that high blood pressure is not a disease but a symptom, and, as such, it is the doctor who is the one competent to interpret the significance

BOOKS

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue Brooklyn N Y Acknowledgment of receipt will be made in these columns and deemed sufficient notification Selection for review will be based on merit and interest to our readers

BREWER & COMPANY, INC.
WORCESTER 8, MASSACHUSETTS U.S.A.

of the figures At the risk of being repetitious, the author keeps emphasizing this again and again

It is to be hoped that many of the laity will read this book, and that many doctors will heed the advice contained therein

S R Blatteis

Clinical Studies in Psychopathology A Contribution to the Aetiology of Neurotic Illness By Henry V Dicks Second edition Octavo of 238 pages Baltimore, Williams & Wilkins Co , 1947 Cloth, $4 50

This short volume on the etiology of neurotic illness presents an important British point of view and, as such, must be taken seriously There are numerous illustrative case histories with what to the reviewer seem sound and sensible interpretations The book is worth study

Andrew Babey

The Rh Factor In the Clinic and the Laboratory Special Issue No 2 of Blood, The Journal of Hematology Joseph M Hill, M D , and William Dameshek, M D , Editors Large octavo of 192 pages, illustrated New York, Grune & Stratton, 1948 Cloth, $4 25

This is a series of articles on the Rh factor within the covers of one book that treat the subject authoritatively and completely This contribution should be a "must" for all those who work in this sphere of hemolytic mechanisms, be it pathologist, hematologist, pediatrician, obstetrician, internist, or general practitioner

Maurice Morrison

Glomerular Nephritis Diagnosis and Treatment. By Thomas Addis, M D Octavo of 338 pages, illustrated New York, Macmillan Company, 1948 Cloth, $8 00

This is a well-written book that deserves a place on the bookshelf of every doctor

Dr Addis writes as he lectures Authentic facts cover the physiology and pathology of the kidneys The clinical picture and the diagnostic aids are clearly given The chapter on treatment is inimitable

Harry Mandelbaum

Modern Clinical Psychiatry By Arthur P Noyes, M D Third edition Octavo of 525 pages Philadelphia, W B Saunders Co , 1948 Cloth, $6 00

This is the third edition of an excellent book on psychiatry It incorporates the numerous contributions made to this field during the eight years that have elapsed since the publication of the previous edition It is a fine book, written by an experienced psychiatrist, that is particularly recommended as a textbook for medical students and as an excellent reference work for the general practitioner

Irving J Sands

Coronary Heart Disease By A. Carleton Ernstene, M D Octavo of 95 pages Springfield, Ill , Charles C Thomas, 1948 Cloth, $2 50

In this small volume, Dr Ernstene of the Cleveland Clinic has produced a sound, but brief sketch of coronary heart disease for the general practitioner

The advice given is simple, sensible, and accurate Rarer complications and refinements of diagnostic technic are sensibly omitted from a monograph of this limited scope A few diagrams would have enhanced the value of this work for the practitioner unfamiliar with modern concepts of coronary disease In short, Dr Ernstene has succeeded admirably within self-imposed limitations

Milton Plotz

Modern Plastic Surgical Prosthetics By Adolph M Brown, M D Octavo of 293 pages, illustrated New York, Grune & Stratton, 1947 Cloth, $6 75

This book is recommended to surgeons where the cosmetic result of any operative procedure or series of procedures will be only fair or even be poor By modern prosthetic technics modified vinyl resins properly colored and possessing the translucence and elasticity of the normal tissue can be easily made to match when reconstructive operations often fail The patient will be better satisfied because of the naturalness of the prosthesis and because it can be done without hospitalization or loss of time from work. This book takes up in detail the various technics as well as all the different materials and their uses in the laboratory

Thomas B Wood

Understandable Psychiatry By Leland E Hinsie, M D Octavo of 359 pages New York, Macmillan Co , 1948 Cloth, $4 00

The author is professor of psychiatry at the College of Physicians and Surgeons, Columbia University, and assistant director of the New York State Psychiatric Institute He is an experienced and seasoned teacher, who slowly but surely raises the students to his own level rather than "talking down" to them Although Freudian in its approach, the work is so readable and so interestingly presented that even the novice will profit by reading it It is a "must" book that should be found on the desk of every practitioner of medicine

Irving J Sands

Nutrition in Health and Disease By Lenna F Cooper, M A , Edith M Barber, M S , and Helen S Mitchell, Ph D Tenth edition Octavo of 729 pages, illustrated Philadelphia, J B Lippincott Co , 1947 Cloth, $4.00

This book has been thoroughly revised and contains a detailed description of therapeutic diets

The chapter on meal planning for the family and the pattern of meals of different nationalities and their habits is of importance The food habits of a patient previous to the onset of illness can be used to advantage in prescribing therapeutic requirements However, since all former nationals are living and being treated in the United States, the therapeutic diet followed by the physician and dietitian should be a prevailing American diet to make for greater uniformity in the nutritional treatment of disease in the United States

There are several chapters on energy requirements, basal metabolism, and acid-base balance

M Ant

Endocrine Therapy in General Practice By Elmer L Sevringhaus, M D 6th ed Octavo of 264 pages, illustrated Chicago, Year Book Publishers 1948 Cloth, $4 00

All books must be considered with reference to their objects The purpose of this is told in its title

Extensive discussion of other phases of endocrine disorders is absent. The advice for treatment is clear and concise and does not wander into exact management of very obscure cases, which, in modern times, can find a more expert manager than the "general practitioner"

We recommend the book to those for whom it is intended

Walter D Ludlum, Sr.

[Continued from page 1224]

in Med Octavo of 456 pages, illustrated Philadelphia, W B Saunders Co , 1948 Cloth, $8 00

Willius and Dry have written a definitive history of cardiology which will serve as a source book to students and cardiologists The arrangement of the contents is novel and enhances its value There are three sections the first is a conventional history, chronologically arranged, of the development of cardiology, the second consists of brief biographies of the principal figures (one misses Heberden!), and the third comprises a chronologic presentation of data according to subjects For example, anyone wishing to learn about the history of aneurysm or of the pulse would find the data conveniently pigeonholed

MILTON PLOTZ

The Metabolic Brain Diseases and Their Treatment. In Military and Civilian Practice By G Tayleur Stockings, M B (England) Octavo of 262 pages, illustrated Baltimore, William & Wilkins Co , 1947 Cloth, $4 50

This is a most unusual book, which will satisfy the author's expectation "that this work will provide material for discussion and profitable controversy among psychiatrists, in addition to arousing the interest of those medical men who are engaged in branches of medicine other than psychiatry " The author shares the great interest aroused by the various forms of shock, or what he prefers to designate as "neurometabolic," therapy, and is equally engrossed in the universal effort to find a pathophysiologic basis for the affective psychoses and to give an explanation for the physiologic and chemical mechanism of the insulin and "shock" therapies

It is a difficult book to read, and one must indulge in mental gymnastics to follow the author and to decipher his new terminology It will certainly arouse considerable controversy among psychiatrists, provided a sufficient number of them will make the effort to read it

IRVING J SANDS

Practical X-Ray Treatment. By Arthur W Erskine, M D Third edition Octavo of 155 pages, illustrated Bruce Publishing Co , St Paul, 1947 Cloth, $4 50

The third edition of this book—original in 1931—second edition in 1936—bespeaks its popular demand As the author intends, it is "practical" from the radiotherapist's standpoint The beginner will find the subject simply and well presented with references for those seeking more profound and detailed knowledge In short it whets the appetite of the would-be radiotherapist and is worthy of a niche in his library

MILTON G WASCH

Clinical Roentgenology of the Digestive Tract. By Maurice Feldman, M D Third edition Octavo of 901 pages, illustrated Baltimore, Williams & Wilkins Co , 1948 Cloth, $8 00

What more can one ask from a book than that it be well-written, splendidly illustrated, and clinically authoritative This third edition by a most competent observer makes it a "must" for anyone interested in the diagnosis of conditions and diseases involving the digestive tract

B M BERNSTEIN

Atlas of Plastic Surgery By Morton I Berson, M D Quarto of 304 pages, illustrated New York, Grune & Stratton, 1948 Cloth, $15

This *Atlas* is produced in orderly form with good illustrations, diagrams, and photographs It includes many of the procedures well known and accepted by plastic surgeons However, some questionable technics are presented which, unless evaluated by surgeons experienced in this field, are apt to lead one into difficulties

DAVID TEPLITSKY

Human Neuroanatomy By Oliver S Strong and Adolph Elwyn Second edition Quarto of 442 pages, illustrated Baltimore, Williams & Wilkins Co , 1948 Cloth, $6 00

This, the second edition, can indeed take its place among the leaders in its field Clear, descriptive material and abundant, well-reproduced illustrations bear testimony to the painstaking efforts of the authors The book follows conventional lines including only that material which is well authenticated Students, practitioners, and neuropsychiatrists will profit from the reading of this book, especially if, at the same time, they undertake a personal dissection of the human brain

THEODORE MELTZER

Between Us and the Dark. By Lenore McCall. Octavo of 303 pages Philadelphia, J B Lippincott Co , 1947 Cloth, $3 00

This is the autobiography of a person giving an account of four and one-half years of her mental illness She was confined in two private mental hospitals She reveals her stark terror and bewilderment as she lost control of the normal pattern of life and found herself hopelessly depressed and separated from her family and friends She describes, in graphic detail, her experiences, associations, and various treatments, including insulin shock therapy, and her final recovery

The reviewer can recommend this gripping story to all who fear insanity or become involved in some emotional or mental difficulty

WILLIAM E MCCULLOUGH

The Driving Forces of Human Nature and Their Adjustment An Introduction to the Psychology and Psychopathology of Emotional Behavior and Volitional Control By Dom Thomas Verner Moore, M D Octavo of 461 pages, illustrated New York, Grune & Stratton, 1948 Cloth, $6 50

The Driving Forces of Human Nature is a deep study of the fundamental forces which activate and control the thoughts, emotions, development, dreams, neuroses, desires, defense mechanisms, will, voluntary and involuntary actions, and the adjustment of people in their relations to their homes, to other people, and to the rest of the world

It deals with the adjustments which are needed between nations in order to secure a well-ordered social economy, not only in one's own country but also in relations with all others

In the last chapter man's relation to God is dealt with as a basic requirement for peace for the individual, for the country, and for the world at large

ARTHUR D JAQUES

Medical Symphony A Study of the Contributions of the Negro to Medical Progress in New York. By Gerald A Spencer, M D Octavo of 120 pages, illustrated New York, The Author, 1947 Cloth $3 50

This study of the contributions of the Negro to medical progress in New York is a factual and reliable treatise of the accomplishment of the Negro physician in all branches of medicine from the period of the reconstruction following the Civil War to the present The author has woven the personalities and contributions made by the Negro professionals in the City of New York into a medical symphony

[Continued on page 1228]

CHARLES B. TOWNS HOSPITAL

ESTABLISHED 1901

FOR ALCOHOLISM, NARCOTIC, AND BARBITURATE ADDICTIONS exclusively

THE TOWNS TREATMENT for alcoholism is a medical and psychiatric procedure Restoration of normal physical functioning is the first objective. This makes possible a more rapid approach to the ALCOHOLIC PROBLEM itself and to its varied psychiatric manifestations.

THE TOWNS TREATMENT for the varied drug addictions accomplishes a rapid but humane withdrawal. It is effective in reducing the intensity of the withdrawal syndrome The psychological phase of the habit receives individualized psychiatric attention in an effort to minimize relapse

Patients are assured complete privacy if desired. Length and cost of treatment are predetermined Physicians and psychiatrists in residency Trained nursing physio and hydrotherapy staff.

of integrated medical progress It covers medicine in all its branches, including public health, dentistry, pharmacy, and nursing It is a very refreshing and instructive book for all those interested in interracial problems and will greatly help to clear up many misunderstandings and prejudices

THOMAS B WOOD

The Clinical Examination of the Nervous System By G H Monrad-Krohn, M D Eighth edition Duodecimo of 380 pages, illustrated New York, Paul B Hoeber, 1947 Cloth, $4 50

This excellent manual has been a guide to students of neurology for years The principal change in the present edition is the addition of an exposition of angiography These new photographs are excellent and form a proper supplement to the illustrations of pneumoencephalography To those unfamiliar with this volume it can be stated that here can be found a clear and authoritative description of the neurologic examination with practical interpretations of the resulting material

ARTHUR J LAPOVSKY

The Medical Clinics of North America. New York Number May, 1948 Octavo Philadelphia, W B Saunders Co , 1948 Published Bi-Monthly (six numbers a year) Cloth, $16 00 net, paper, $12 net

It is difficult to pick out the best contributions in this excellent volume on neurology and psychiatry Outstanding are *Headache*, by Kunkle and Wolff, *Anxiety States*, by Rennie, and a magnificent paper by Dattner of Bellevue on *Neurosyphilis* Once again this book is highly recommended

ANDREW BABEY

The Battle of the Conscience A Psychiatric Study of the Inner Working of the Conscience By Edmund Bergler, M D Octavo of 296 pages Washington, D C, Washington Institute of Medicine, 1948 Cloth, $3 75

The Battle of the Conscience is an analysis of the problems facing individuals and peoples as to the right and wrong method of living and the facing of the problems of life with regard to that "still small voice," called conscience One may try to ignore the existence of a conscience, but it is always present If it is properly recognized and conscientiously lived up to, one cannot help but live a sane and happy life Dr Bergler's analysis gives one an excellent guide to follow

ARTHUR D JAQUES

Treatment of Heart Disease By William A Brams, M D Octavo of 195 pages, illustrated Philadelphia, W B Saunders Co , 1948 Cloth, $3 50

This is a satisfactory treatise, modestly priced for general practitioners, on the treatment of heart disease It is not complete enough for specialists or even for those who have one of the larger standard texts devoted to the heart Even within its limited scope, a serious omission is the failure to include a detailed salt-free diet

MILTON PLOTZ

Nuremberg Diary By G M Gilbert, Ph D Octavo of 471 pages New York, Farrar, Straus & Co , 1947 Cloth, $5 00

Prison psychologist of the Nuremberg jail, G M Gilbert, had the opportunity to watch and record the personal disintegration of the Nazi overlords He reports Goering's grandiose poses, the hypocrisy of Von Ribbentrop, Schacht's air of innocence, and the story of Hess' amnesia. He exposes their attitude toward Hitler and the feuding among themselves Gilbert's understanding of the German language, free access, and intimate relationship qualified him to write the story of the Nuremberg trial

His report is truly narrative, boring, and repetitious in spots, but on the whole, extremely interesting

WILLIAM E MCCULLOUGH

Congenital Malformations of the Heart. By Helen B Taussig, M D Quarto of 618 pages, illustrated. New York, Commonwealth Fund, 1947 Cloth, $10

This is a most needed up-to-date book on *Congenital Malformations of the Heart* The author has spent many years studying the methods of diagnosis of these conditions Careful classification has rendered proper treatment of anomalies

THURMAN B GIVAN

Psychobiology and Psychiatry A Textbook of Normal and Abnormal Human Behavior By Wendell Muncie, M D Second edition Octavo of 620 pages, illustrated St Louis, C V Mosby Co , 1948 Cloth, $9 00

In this volume the author has given us an exposition of the teachings of the psychobiological school as modified by his own experience A large portion of the book develops a plan for investigation and understanding of the signs, symptoms and problems of the psychiatric patient

There is much wisdom and a lack of cryptic terminology displayed throughout even though the difficult classification of the Baltimore school is used Students as well as practitioners will profit markedly by a study of this thoughtful and lucid book

ARTHUR J LAPOVSKY

The Nursing of Tuberculosis. By O V Buxton S R N , and P M Macculloch Mackay, S R M N Illustrated by Nora Lewis, S R.N Duodecimo of 124 pages, illustrated Bristol, John Wright & Sons, Ltd (Baltimore, Williams & Wilkins Co), 1947 Cloth, $2 00

This excellent book on tuberculosis covers every phase of the disease which nurses must consider Importance is given to care of patient and psychologic aspects of the disease

The book is well organized, and important words and titles are in special type

This book should be placed in the hands of student nurses and all graduate nurses taking care of tubercular patients and should be available in all institutions in which tubercular patients are treated

MARIE M BEHLEN

Vitamine und Vitamintherapie By Emil Abderhalden, M D , and Georges Mouriquand, M D Octavo of 408 pages, illustrated Bern, Switzerland, Medizinischer Verlag Hans Huber, 1948 Board, 28 Fr

This book is an interesting publication, in which two authors write about the same subject in their different but very pertinent and characteristic ways Both cover approximately the same number of pages Abderhalden presents a perfect up-to-date description of our knowledge in experimental vitamin research, and Mouriquand adds the clinical experiences in vitamin deficiencies and therapy The latter stresses the etiology by dividing the deficiencies into Exokarenz, Enterokarenz, and Endokarenz He also describes the phenomenon of paravitaminosis and the manifestations of hypervitaminosis The book is very technical and somewhat difficult to read, but it is an excellent reference book and as such it is to be highly recommended

A potent vasodilator

effective by mouth...

PRISCOLINE

FORMERLY PRISCOL*

In doses of 25 to 75 mg, administered either orally or parenterally, Priscoline hydrochloride is a useful adjunct to treatment of many peripheral vascular diseases or circulatory disorders, and in this dose range usually is tolerated with few side effects."[1]

Priscoline "improves the circulation by dilatation of blood vessels. The drug acts in three ways: it has a histamine-like effect upon smaller blood vessels, it blocks the augmentor sympathetic vascular receptors, and has an adrenolytic effect which also results in dilatation of blood vessels. . . numerous reports have shown favorable results."[2]

Patients should be closely observed until optimal dosage is established, for possible paradoxical effects or orthostatic hypotension.

Estrogen Progesterone SOLUTION BREON

Estrogen-Progesterone Solution contains per cc. of oil: 20,000 I.U. Natural Estrogens, 10 mg. Progesterone.

SUPPLIED IN 5 cc. VIALS

double deficiency

"Predisposed to Abortion" describes women who habitually abort because of ovarian hormonal deficiencies. Most spontaneous abortions are preceded by low estrogen and pregnandiol levels indicating that the corpus luteum or chorioplacental system is not producing enough estrogen and progesterone to maintain pregnancy[1]

Often in cases of this kind the woman can become a mother if Estrogen-Progesterone Solution is used to correct the DOUBLE DEFICIENCY. Estrogen-Progesterone is also useful in rapid treatment of secondary amenorrhea.[2] (Zondek technique.)

THE CLIFTON SPRINGS SANITARIUM and CLINIC

THE CLINIC

Medical sections for the care of metabolic and cardiovascular diseases, arthritic, psychoneuroses, gastroenterology pediatrics and hematology as well as general diagnosis are available Surgical sections are available for general surgery and the various surgical specialties. Laboratory sections are maintained for radiology and pathology. The clinic is general and maintains competent medical, surgical and laboratory staffs. All types of general medical and surgical cases are received for diagnosis and treatment. Recognized forms of physiotherapy are provided. There is an excellent dietetic service. No cases of active pulmonary tuberculosis, contagious disease epilepsy or insanity are accepted.

THE SANITARIUM

REST, RELAXATION, MEDICAL CARE

The Sanitarium has all the atmosphere of a fine hotel with individual rooms and tasteful decorations. A special feature is made of occupational therapy of all kinds with competent staff and facilities. Other features are large cheerful solarium, billiard room, complete gymnasium, complete bath and massage department. The spacious grounds include a nine hole golf course All the sanitarium facilities are open to guests who do not wish examination and medical care but come simply for the baths and massages and rest and recreation. Modern medical equipment and superb location offer the combined advantages of a medical center and rural Spa.

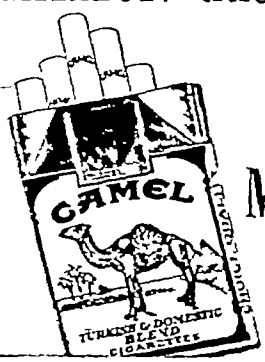
THROAT SPECIALISTS PROVE CAMEL MILDNESS IN 30-DAY SMOKING TEST



● In a recent coast-to-coast test, hundreds of men and women smoked Camels—and only Camels—for thirty consecutive days They smoked on the average of one to two packages of Camels a day Each week during the entire test period, the throats of these Camel smokers were examined by throat specialists A total of 2,470 careful examinations were made And after correlating these case histories, the throat specialists reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION due to smoking CAMELS."

MONEY-BACK GUARANTEE!

Try Camels and test them as you smoke them. If at any time you are not convinced that Camels are the best cigarette you've ever smoked return the package with the unused Camels and you will receive its full purchase price plus postage (Signed) R J Reynolds Tobacco Co Winston-Salem N C.

According to a Nationwide survey

MORE DOCTORS SMOKE CAMELS

than any other cigarette

When three leading independent research organizations asked 113 597 doctors what cigarette they smoked the brand named most was Camel

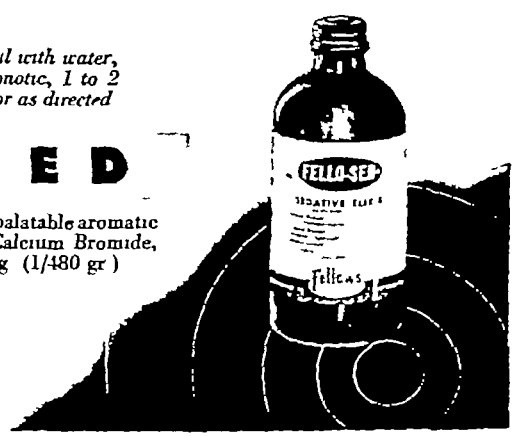
(Continued on page 1238)

Chloral hydrate, used in medicine since 1869, is, even today, "the standard hypnotic of its class"[1]

Goodman and Gilman observe that it "is unfortunately neglected today," and that the present widespread use of the barbiturates has " caused the physician to lose sight of the fact that chloral hydrate is still one of the cheapest and most effective hypnotics"[2]

In FELLO SED, supplementation with calcium bromide and atropine sulfate largely overcomes unwanted side actions, enhances the sedative effect and provides valuable antispasmodic activity It is presented in palatable liquid form



[1]N.N.R., 1947 p. 398.
[2]Goodman, L. & Gilman, A., The Pharmacological Basis of Therapeutics MacMillan, 1944, pp. 177-8.

Available in 8 fluidounce bottles

Adult Dose. As a sedative. ½ to 1 teaspoonful with water, every 3 or 4 hours or as directed As a hypnotic, 1 to 2 teaspoonfuls or more with water at bedtime, or as directed

FELLO-SED

FORMULA: Each fluidram (4 cc.) contains, in a palatable aromatic vehicle Chloral Hydrate, 0 5 Gm (7½ gr), Calcium Bromide, 0.5 Gm (7½ gr) Atropine Sulfate, 0 125 mg (1/480 gr)

Announcing

an aid to

Sedation

Many investigators have reported the value of parenteral alcohol in operative cases as a sedative and analgesic, substituting for opiates and so eliminating undesirable side effects. In introducing this solution of 5% Protein Hydrolysate w/v, 5% Dextrose w/v, and 7 5% Alcohol v/v, Baxter Laboratories offer a single solution which provides protein nourishment, caloric value and sedation.

Write today for 16-page booklet giving detailed information on Protein Hydrolysate Baxter

product of
BAXTER Laboratories
Morton Grove, Illinois
Acton, Ontario

protein and caloric requirements with minimum fluid infusion In many cases where nutrition must be provided parenterally, it has been difficult to provide sufficient calories without too much fluid. In addition to its analgesic value, this solution provides a richer available source of energy than dextrose and protein digest solutions. Each 1000 cc provides 800 calories.

Distributed and available only in the 37 states east of the Rockies (except El Paso Texas) through

Schering

is pleased to announce that it has made available for use in the treatment of

PSORIASIS

SEVINON

specially purified undecylenic acid for oral administration

Attention has recently been drawn to "an interesting approach"[1] to the control of psoriasis and neurodermatitis. Perlman[2] has reported that following the oral use of undecylenic acid, *psoriasis was relieved completely in 3 out of 17 patients and was* partially relieved in the remainder "Relief of itching is sometimes noticed as early as two days after institution of treatment undecylenic acid seems to hold a great deal of promise in the improvement and possible prevention of recurrences of psoria sis and neurodermatitis "[2]

SEVINON* is available in gelatin capsules containing 0·44 Gm. undecylenic acid, highly purified for oral use. The dosage employed by Perlman[2] corresponds to 5 to 6 capsules three times daily by mouth, continued in some cases for as long as six months.

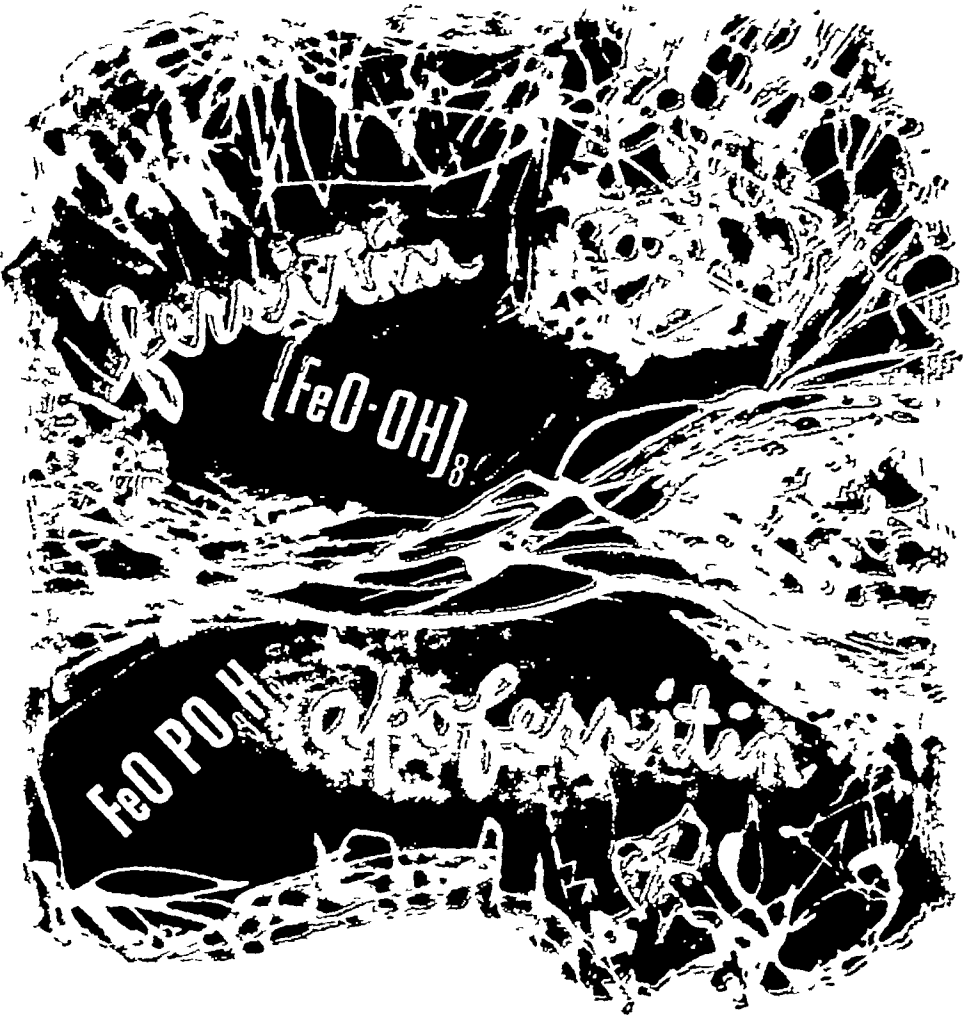
for a
GREATER FALL
in blood pressure



Of the many drugs used to lower arterial pressure in hypertension, veratrum viride Biologically Standardized (in CRAW UNITS*) produces the greatest fall in blood pressure in the greatest number of patients.

VERATRITE represents a practical modification of this effective hypotensive drug for everyday management of the mild and moderate cases of essential hypertension. Prolonged action, wide range of therapeutic safety and complete simplicity of administration are specific advantages of Veratrite therapy Each Veratrite Tabule contains Biologically Standardized veratrum viride 3 CRAW UNITS, sodium nitrite 1 grain; phenobarbital ¼ grain. The magic wall

Nowhere in the realm of biology exists so highly specialized and so biologically efficient a membrane as the mucosa of the human intestinal tract Within this mucous membrane, about five millimeters thick, there take place the most intricate biochemical reactions designed to facilitate absorption of the products of digestion.

Research upon the fundamental aspects of hemopoiesis has gone forward steadily at *Lederle* for more than 20 years Liver extract, FOLVITE* Folic Acid vitamins, combinations with ferrous iron, and such products of nutritional value in tissue repair as amino acids, have been made available as rapidly as they could be perfected

Lederle research is proceeding actively in the field of the nutritional anemias, to the end that these almost completely preventable diseases may one day essentially disappear from daily clinical practice

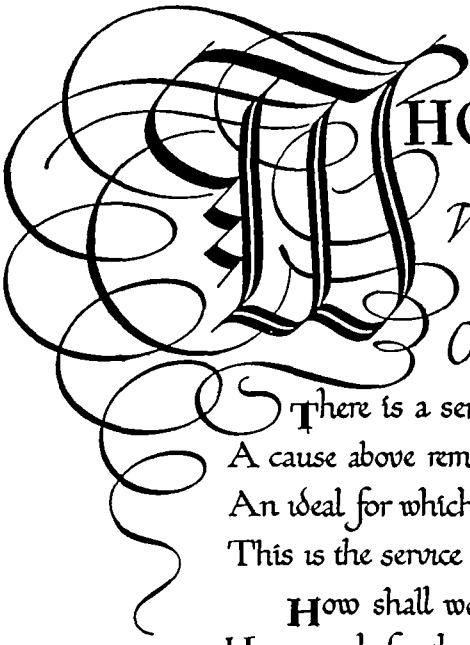
AMERICAN DOCTOR

rendered..."



There is no algebra for it, no scribble of figures, no proper value
For this is a service as large as life, and as manifold
It is a soldier crying in agony on a thousand battlefields
It is the terrible word "Why?" under the surgeon's probe
It is the end of pain
It is Hope
It is the lonely, unending quest for knowledge
It is the fight against ignorance, sloth, superstition.
It is the dumb, unspeakable joy in the eyes of a parent
It is the rock of grief
It is cold rain and pounding storm and bone-weariness and the new-born babe gasping its first breath in the grey dawn.
It is all this, and the quiet glory of the job done,
Dedicated to service—in the name of Mercy
And the common brotherhood of man

PHILIP MORRIS & COMPANY

PHILIP MORRIS will be happy to send you a handsomely printed and illuminated copy of this tribute, suitable for framing. Please make your request on your professional stationery. Address Research Dept. PHILIP MORRIS & CO., LTD. INC. 119 Fifth Ave. New York 3, N.Y.

IN TRIBUTE TO THE

"... for services

WHO shall measure devotion, or put a price on sacrifice?
Who shall assess the long war against the power of Death?
Or set a sum upon the gift of Life?

There is a service beyond the measure of a fee
A cause above remuneration
An ideal for which there is no price
This is the service the cause the ideal of the American doctor

How shall we reckon it, and by what formulae?
How much for the laughter of a little child rescued out of crisis?
What's the cost of discouragement?
Who can pay for a sleepless night?
Name the price of a cure!

Analgesic salivary lavage

after tonsillectomy

Chewing Aspergum promptly releases a soothing, constant flow of "salivary analgesia"—laving mucosal surfaces and reaching crypts often inaccessible to gargles or irrigations Moreover, by encouraging gentle chewing and swallowing, Aspergum helps relieve local muscular stiffness and soreness

Aspergum simplifies post-tonsillectomy care—shortens convalescence

Children welcome this form of medication—they like the flavor and chewing gum form of Aspergum Each tablet of Dillard's Aspergum contains 3½ grains of aspirin. White Laboratories, Inc , Pharmaceutical Manufacturers Newark 7, N J

Dillard's **Aspergum**

For more than two decades a dependable and welcome aid to patient comfort

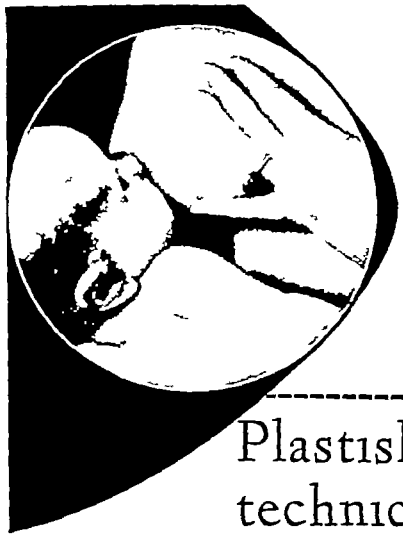
what Pragmatar's special base means to you

PRAGMATAR's superior oil in water emulsion base helps make it the outstanding tar-sulfur-salicylic acid ointment Because of this special base, PRAGMATAR mixes readily with the skin's oily mantle and with serous exudate The therapeutically active agents come into intimate and prolonged contact with the lesion PRAGMATAR, furthermore, is non gummy and non staining, easy to apply and easy to remove

Smith, Kline & French Laboratories, Philadelphia

FORMULA cetyl alcohol coal tar distillate, 4%, near colloidal sulfur, 3%, salicylic acid, 3% Available in 1½ oz jars

Pragmatar



highly effective in an unusually wide range of common skin disorders

Plastishield technic of aseptic breast care approved by nursing mothers

The new *Plastishield* technic of postpartum breast care is well liked by patients This fact is borne out by the reports summarized below

50 patients 6 weeks to 6 months postpartum replied to a questionnaire as follows [1]

1 Are Plastishields comfortable to wear?
YES 90% NO 10%

2 Do Plastishields prevent soiling of clothes by milk leakage?
YES 88% NO 12%

3 Do Plastishields prevent nipple irritation?
YES 98% NO 2%

1 000 patients in 5 hospitals answered the same questions as follows [2]

QUESTION #1 YES 91% NO 9%
QUESTION #2 YES 75% NO 25%
QUESTION #3 YES 98% NO 2%

Thus it will be seen that Plastishields encourage breast feeding because they

1 Protect the nipple and areola from soreness and fissuring
2 Are conveniently and comfortably worn
3 Are characterized by greater cleanliness than other methods

PATENT APPLIED FOR AND T DEMARK REGISTERED N THE UNITED STATES

Swifter Recovery from WOUND ULCERS

Pressure gauze dressings of White's Vitamin A&D Ointment was the only treatment, skin-grafting was unnecessary

Second and third degree burns involving 25% of body surface

White's Vitamin A&D Ointment induces rapid, healthy epithelialization and gratifying relief from discomfort in such conditions as burns, slow healing wounds, indolent ulcers, avulsive injuries, various post-operative wounds, fissured nipples, and a variety of dermatologic conditions White Laboratories, Inc, Pharmaceutical Manufacturers, Newark 7, N J

Vitamin A&D **Ointment**

for faster healing

Supplied in 1.5 oz. tubes 8 oz. and 16 oz. jars and 5 lb. containers

Results in 22 cases of chronic granulomatous wounds

"The group of chronic granulomatous lesions not associated with underlying bony infection consisted principally of decubitus ulcers Nine such ulcers were on paraplegic patients and the results here were most gratifying Early erradication of gross infection, early appearance of healthy granulation and progressive epithelization of these decubiti were marked in every instance Every patient selected in this group had been treated previously with various local ointments and solutions with uniformly poor results Of the total group of twenty-two cases, failure to obtain healing occurred in six instances

Results in 6 cases of chronic varicose ulcers

" diminution in the size of the ulcer occurred in every instance within two weeks and complete epithelization was obtained in four instances in each case selected very definite improvement occurred with chlorophyll ointment although previously the ulcers had been resistant to all types of treatment

CONCLUSIONS

"In the treatment of chronic suppurative osteomyelitis, both of hematogenous origin and secondary to compound fractures, the efficacy of chlorophyll solution locally combined with adequate sequestrectomy, produced uniformly rapid erradication of infection, early wound healing and substantial evidence of clinical cures, not previously experienced in this type of infection when treated by the usual time-honored methods of sequestration

"Chlorophyll derivative preparations in the treatment of decubitus ulcers, particularly in paraplegics, demonstrated tissue-stimulating properties, with subsequent early epithelization not previously seen in these particularly slow and indolent types of ulcer

"Chlorophyll ointment locally as an adjunct to treatment of varicose ulcers previously resistant to all forms of treatment, demonstrated remarkable therapeutic properties in every instance.

Follow-Up Observations after 18 Months

"The period of follow-up has not been less than eighteen months for any case and on a number of cases two years of observation have been possible

"In the group of patients with chronic suppurative osteomyelitis, of whom fifty-four originally healed following sequestrectomy and delayed primary closure, two have developed recurrence of infection requiring additional surgery The remaining patients have been clinically asymptomatic with no evidence of recurrence of infection.

"The group of cases of osteomyelitis following compound fractures has been very interesting to observe Of this original group of twenty-four patients, additional surgery has been necessary in six Of the entire group of eighteen patients who have not required additional surgery there has been no evidence of recurrence of infection

"The group of indolent ulcers or decubiti, particularly on paraplegics, have remained healed without evidence of breakdown

"The 6 cases of varicose ulcers have unfortunately not been followed as closely Observation on three of the most resistant cases has been possible and to date the ulcers have remained healed without breakdown in two of these cases The remaining case had a 2 cm area of breakdown which responded rapidly to chlorophyll ointment pressure dressings, with subsequent healing

"All of wounds (in the 15 cases of chronic suppurative osteomyelitis of the small bones of the extremities) progressed to eventual healing without surgical intervention follow-up on twelve cases has been obtained and there has been no recurrence of infection to date "

Chlorophyll therapy in 127 cases of chronic osteomyelitis and ulcers

Excerpts from a clinical report (1) on an investigational study, published in the American Journal of Surgery, 77.162, 1949

This report is one of an extensive series of carefully supervised studies on the wound healing effectiveness of Chloresium

• *This synopsis is designed to give physicians a brief, convenient summary of the clinician's experience with Chloresium chlorophyll therapy It quotes his reasons for choosing this method of treatment his results in various types of cases and his evaluation of chlorophyll therapy, including his follow-up observations, eighteen or more months after treatment*

(1) *Original paper prepared by E B Carpenter, M D , Department of Orthopedic Surgery, Medical College of Virginia Hospital, Richmond, Va*

Why chlorophyll therapy was employed

" The action of chlorophyll as a therapeutic agent is essentially that of a stimulant to cellular metabolism

"Because of disappointments and failures to obtain early healing in chronic granulomatous processes by the usual classical procedures, and with an increasing number of enthusiastic reports relative to chlorophyll preparations, in recent literature, the writer was stimulated to investigate these (Chloresium) preparations clinically in a carefully selected and controlled series

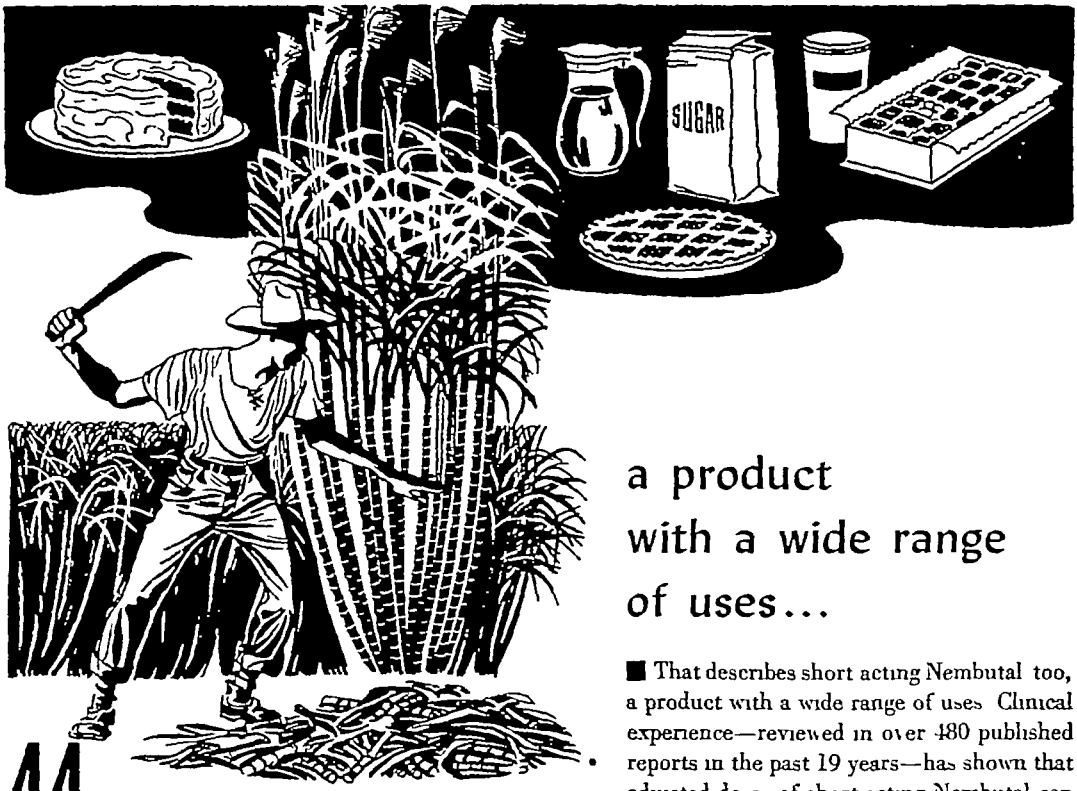
How the cases were selected

"The cases chosen for this investigation were carefully selected from a busy orthopedic service in a prominent teaching hospital The cases selected were in each instance chosen by the writer and followed personally throughout their course of treatment and follow-up

"The period covered in this clinical study was nine months (See "Follow-up Observations" for final conclusions), 127 cases were selected and treated during this period

"The chlorophyll preparations* used were (1) water-soluble active chlorophyll derivatives in isotonic solution, (2) water-soluble chlorophyll derivatives in a hydrophylic ointment base, (3) chlorophyll-penicillin solution containing 2,000 units of penicillin per cc of water-soluble chlorophyll derivatives, (4) fine mesh gauze impregnated with water-soluble chlorophyll derivative ointment

Results in 59 cases of chronic suppurative osteomyelitis in which surgical intervention was held necessary



" Fifty-six healed per primum following the delayed closure and have remained healed without evidence of recurrence of infection or breakdown of the wound One patient developed several small subcutaneous abscesses following the delayed closure, necessitating incision and drainage of the abscesses Two wounds failed to heal following the delayed closure and continued to drain

Results in 25 cases of subacute or chronic suppurative osteomyelitis secondary to compound fractures

" skin defects were covered and the wounds healed in twenty-three instances The two other wounds broke down following skin grafting and required additional skin grafting or plastic closures

"Following the start of chlorophyll dressings, the rapid disappearance of the foul odors associated with these cases was very marked in every instance and was most gratifying to both the patient and to the others on the wards

*The water soluble chlorophyll derivative preparations used in this study were generously supplied by Rystan Company Inc. Mt. Vernon N Y , and are marketed commercially under the trade name Chloresium.

a product with a wide range of uses...

■ That describes short acting Nembutal too, a product with a wide range of uses Clinical experience—reviewed in over 480 published reports in the past 19 years—has shown that adjusted doses of short acting Nembutal can achieve any desired degree of cerebral depression, from mild sedation to deep hypnosis Furthermore, the dosage required is only about *one half* that of many other barbiturates Small dosage offers important advantages less drug to be inactivated, shorter duration of effect, reduced possibility of "hangover," wide safety margin and definite economy to the patient Look over the list of indications at left It may disclose new ways in which you can make effective use of short acting Nembutal Write for the new booklet "44 Clinical Uses for Nembutal" ABBOTT LABORATORIES North Chicago, Ill

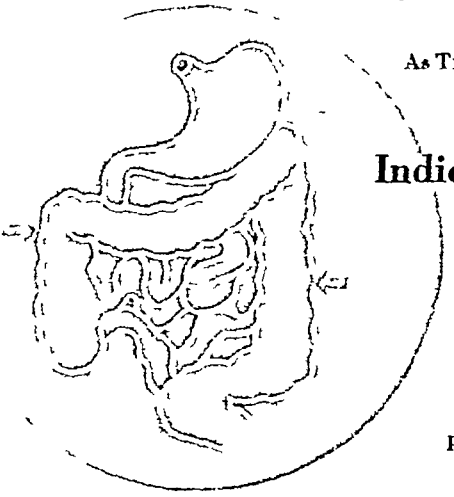
"One nervous woman can give rise to more diverse, undiagnosed and undiagnosable complaints than a whole pathological ward"

Harding, T S M Rec 160 198, 1947

For the many patients, especially women, who complain of nervous tension throughout the day and wakefulness during the night, ESKAPHEN B ELIXIR is an ideal preparation

ESKAPHEN B ELIXIR provides both the calming action of phenobarbital (1/4 gr per 5 cc) and the tone-restoring effect of thiamine (5 mg per 5 cc)

Eskaphen B Elixir



The delightfully palatable combination of phenobarbital and thiamine

Smith, Kline & French Laboratories, Philadelphia

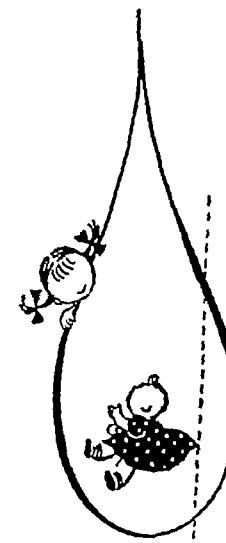
Thalamyd

Phthalylsulfacetimide-Schering

THALAMYD,* a new "nonabsorbable" sulfonamide, for the treatment of enteric infections due to susceptible organisms and for preoperative prophylaxis in abdominal surgery, possesses the unique property of being absorbed by the intestinal mucosa in high concentration where it remains temporarily *without being absorbed by the blood stream in detectable amounts* following oral dosage. THALAMYD is bactericidal for common dysenteric organisms and for all coliform bacilli normally present in the intestine THALAMYD, therefore, destroys susceptible pathogenic organisms within the *wall of the gut* as well as within its lumen Because of its ability to temporarily *eliminate completely* E coli from the intestinal flora,[1] it offers the latest approach to safer abdominal surgery

As THALAMYD is virtually unabsorbed by the systemic circulation it is completely nontoxic to hematopoietic tissues and to the urinary tract

Indications: Bacillary dysentery (shigellosis) and for preoperative prophylaxis in abdominal surgery THALAMYD has proved effective in ulcerative colitis



dosage 9 Gm. daily in divided dosage, after meals. Usually not more than 0.2 Gm. per kilogram of body weight is necessary in 24 hours. Children's dosage may be computed on this basis, up to 40 kg. For ulcerative colitis higher dosages may be used without danger of toxicity due to the nonabsorbable character of THALAMYD

packaging: THALAMYD tablets contain 0.5 Gm. (7.7 gr.) of phthalylsulfacetimide per tablet Bottles of 10 and 1000 tablets.

AN IMPORTANT NEW MILESTONE

in the Therapy of Arthritic Affections . . .

The "cure of [rheumatic fever]", agree most authoritative sources,[2,3,5,6] "depends not only on reaching, but also on maintaining a high plasma salicylate level "[5] The correlation between such blood levels and symptomatic improvement is graphically shown in the table at the right [6]

Pabalate—latest product of Robins' research —now helps to achieve and maintain *higher salicylate blood levels on lower salicylate dosage*

This is made possible by the combination in Pabalate of non-toxic para-aminobenzoic acid with sodium salicylate As visualized in the chart at the lower right,[4] para-aminobenzoic acid (itself an active antirheumatic)[7] manifests a reciprocal action with salicylates when administered concurrently—sharply increasing the blood salicylate levels (under constant salicylate dosage),[1,4] and in turn having its own blood levels effectively enhanced [4]

The clinical significance of this synergistic relationship represents an important advantage in the therapy of arthritic affections Pabalate 'Robins'—a strictly ethical preparation—is available at (or may be secured by) all leading pharmacies

A. H ROBINS CO, INC., RICHMOND 20, VA.
Ethical Pharmaceuticals of Merit since 1878

Salicylate blood level (in mg. per 100 cc.)	Erythrocyte sedimentation rate
less than 20 mg.	no fall
20-30 mg.	slow fall
30-40 mg	RETURN TO NORMAL CLINICAL SYMPTOMS SUBSIDE

indications Rheumatoid arthritis, acute rheumatic fever, fibrositis, gout, osteo-arthritis.
dosage Two or three enteric coated tablets every three or four hours, without sodium bicarbonate.
formula Each enteric coated tablet contains Sodium salicylate, U S P (5 gr), 0.3 Gm, Para aminobenzoic acid (as sodium salt), (5 gr), 0.3 Gm.
supplied In bottles of 100 and 500 enteric coated tablets.

For high salicylate blood levels on low salicylate dosage—

Pabalate®

Pabalate tablets are enteric coated to prevent gastric irritation and insure optimal toleration.

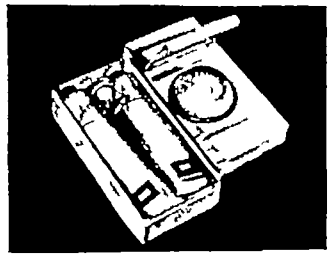
After twenty years

MAXIMUM EFFICIENCY IN CONTRACEPTION

Twenty years ago Lanteen Medical Laboratories began pioneer work in contraception, a field which was then widely denounced both within and outside of the medical profession At that time, the most widely known contraceptive methods involved the use of such devices as lamb's wool tampons, rubber sponges and cotton plugs Home-made vaginal suppositories were often prepared to be used either with these devices or alone A greasy concoction of cocoa butter and boric acid, which was first heated in a skillet and then placed in the ice-box to cool, was in common use Primitive as those methods seem today, they served a useful social and medical purpose

The real pioneering task was to develop better products leading to more reliable and scientific contraceptive methods Year after year Lanteen moved resolutely toward this goal, and, through continuous research and study, the Lanteen Diaphragm and Jelly method was developed



With the years came gradual recognition Many of those opposed to contraception came to see the rightness of the cause Lanteen had so steadfastly supported The improved Lanteen Method was hailed as the answer to a difficult problem

Now, after two decades of pioneering, Lanteen is still a leader in this field The Lanteen Diaphragm and Lanteen Jelly are widely prescribed as a most modern, scientific advance in contraceptive technique

These twenty years have indeed been years of achievement

The Lanteen Diaphragm and Lanteen Jelly are accepted by the Council on Physical Medicine and the Council on Pharmacy and Chemistry of the American Medical Association respectively

LANTEEN MEDICAL LABORATORIES, INC.

900 North Franklin Street

Aluminum PENICILLIN.

ORAL TABLETS

Aluminum Penicillin Oral Tablets are clinically effective in the treatment of penicillin susceptible infections

Containing the almost insoluble trivalent aluminum salt (not a mixture), they provide for maximum utilization of the dose administered

Low solubility of Aluminum Penicillin renders it much less liable to inactivation in the stomach Destruction in the intestinal tract is inhibited by the addition of sodium benzoate Slow conversion to a readily absorbed form in the more alkaline conditions of the intestinal tract enhances clinical effectiveness

Aluminum Penicillin is not toxic in doses far exceeding those used therapeutically and does not cause gastric disturbance

Specify Aluminum Penicillin Oral Tablets, H W & D

Supplied in vials of twelve tablets each containing Aluminum Penicillin, 50,000 units, and sodium benzoate, 0 3 gram

* Patent applied for

Oral Tablets *Now Council Accepted*

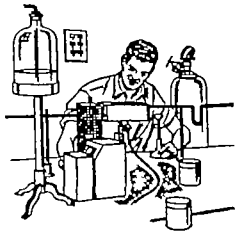
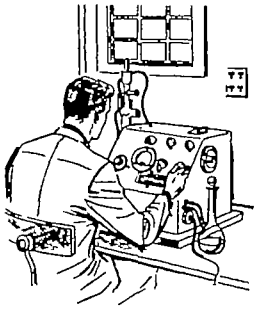
Disaster

Disasters may be of many kinds—personal, physical, moral, political, or economic Some kinds are preceded by warnings, for example, the rumblings which usually precede the eruption of a volcano, others strike suddenly and silently Are we physicians on the verge of some sort of disaster? Have we for long disregarded the warning signs and portents?



The entrance of government into the medical field has large implications of disaster These are mainly political and have probably been underestimated as to their importance More and more during recent decades the individual has become subordinate to the state, the citizen's coming and going has been and will be increasingly supervised by a supreme order To the state he must contribute his wherewithal but is permitted little or nothing to say about its disposition

Propaganda for government-controlled, tax-supported medical care promising everything "for free" is increasing in intensity Both Federal and state legislation to that dubious end is before Congress and various state legislatures Much of it promises what, with present or foreseeable facilities, cannot be performed with the best of intentions even under the lash of compulsion Yet the citizens are being asked to trade their birthright of individual initiative and their self-respecting structure of free enterprise for this sorry mess of tax-supported pottage which is anything but "free"



The American Medical Association and the several component state medical societies have recognized the necessity for better distribution of better medical service They have fostered the rapidly growing voluntary prepaid medical and surgical care plans These have had to be built on a foundation of sound actuarial practice to remain solvent and to provide policy holders with the medical service their contracts call for No other way is open to private enterprise than to pay its way, to keep its administrative costs as low as possible, and to sell insurance on its merits

As this is written, new and highly significant reports of new advances in the means for early diagnosis of cancer are appearing, universities are announcing new schools for study of the social sciences, more light is

BEHIND THE PEDIATRICIAN

Keeping little ones well is the job of the pediatrician Nutrition, infection, injuries, and abnormalities in behavior are his everyday problems This day-in, day-out preoccupation with the health of children gives the pediatrician a profound, practical knowledge of his field and a keen perception of the human equation

Pharmaceutical and biological products are playing an increasingly important role in the practice of pediatrics Several diseases of childhood are preventable with routine immunization procedures Palatable vitamin preparations assure infants and young children of prophylaxis and cure of vitamin deficiency syndromes Sulfonamides, penicillin, and streptomycin have sharply reduced the toll of many infectious diseases Lilly research scientists are concerned daily with the yet unsolved problems facing the pediatrician Sharper tools for the physician's competent hands are certain to result

Lilly

many years, maintained a comprehensive system of recording all discharge diagnoses The voluntary and proprietary hospitals have by unanimous action agreed to participate on a voluntary basis

There have been surveys of sickness often masquerading under the false label of health surveys There have been records made of illnesses among persons insured for hospital or medical care There are records of illness prevalence in the armed forces There is no knowledge of medically determined illness currently in a stable community such as the City of New York represents

Within the next few months a beginning will be made which will reveal the amount and kind of sickness that is admitted to hospital care, such weekly reports to make possible simple tabulation by age and sex according to the hospital of admission, the diagnosis on discharge being used

The usefulness of current morbidity reporting by hospitals depends on accuracy and comparability of the initial record, which would seem to be well assured under the conditions proposed in New York City Such data, even if of the highest quality, will prove as dull and lifeless as most of our mortality statistics unless the fluctuations of disease by time of year, by area or conditions of residence, by age, sex, employment, and economic conditions are studied and followed through with systematic efforts toward prevention or control

If we are to avoid a steadily increasing pressure for special reporting by the practicing physician of each new category of illness which emerges into public prominence, we must have a source of information about all illness which will serve some practical purpose Registers of cancer, heart disease, arteriosclerosis, diabetes, multiple sclerosis, epilepsy, cerebral palsy, etc , are being developed with no regard for the cost and time wastage of such complexity of reporting placed upon the family physician

From the time of Farr, Simon, Graunt, and others in the middle of the last century, much effort has been spent, and truly precious results have accrued from the collection, tabulation, analysis, interpretation, and publication of certified causes of death We have learned much from an honest study of these ashes of human existence Today, the possibilities of life-saving and health promotion follow each other in such swift succession that we can no longer follow the leisurely pattern of the 1890's and await the ponderous evidence of falling death rates over the decades to justify our efforts and crown our hopes with success

We must know the current facts of disease occurrence, its incidence, its prevalence, its expectancy, if our well-trained field force of sanitarians, epidemiologists, statisticians, public health nurses, and health educators are to function in a way worthy of their professional abilities Morbidity reporting is on the way It is necessary It will contribute to the saving of lives, and shorten the gap between information of preventable human illness and action for its avoidance

The Chances for a Long Life

Notwithstanding all the tirades to which people have been subjected from numerous sources about the alleged lack of adequate medical care in this country, these do not appear to be substantiated by what we are now learning about the constantly increasing span of life That men and women have succeeded in gaining partial control over their environment is perhaps true, and in the term environment we may include better food, better shelter, better knowledge of how to maintain good health, as well as better medical care The progress and achievements in the latter deserve definite consideration by the people of these United States

The average length of life, that is to say the expectation of life at birth, has jumped in this country from 49 24 years at the beginning of the century to 66 69 years, women making a somewhat better showing than men [1] All the factors which have brought about these changes reinforce each other, and greater reduction in morbidity and mortality, as well as more protection

[1] Statistical Bulletin Metropolitan Life Insurance Company November 1948.

being shed on the nutritional necessities of cancer cells—all under the banner of private enterprise and the drive of individual initiative

Education of the public is needed It must be universal, and to this end the American Medical Association has widely undertaken a campaign of public instruction Its efforts must be supported, which can be done in a substantial fashion by a contribution to the funds now being developed for this purpose This is not a "slush" fund as announced by one of our famous radio commentators recently It is devoted entirely to public education of what compulsory health insurance means

If you have not done so, send your contribution to your county society treasurer and do it at once in order to demonstrate your cooperation with this worthy cause

Morbidity Reporting—An Essential for Public Health of the Future

In April, 1929, in Berlin, the Committee of Expert Statisticians of the League of Nations took action to encourage the preparation of standard nomenclature of disease appropriate for the use of reporting medical diagnoses In Great Britain and the U S A this challenging request was effectively acted upon Widespread use of the *Standard Nomenclature of Disease, Injuries, and Operations* in the hospitals of our country followed its publication under the auspices of the New York Academy of Medicine and later, or at present, by the A M A The educational value of such a nomenclature has been extensive among the recent medical graduates, interns, and residents across the nation and in all our schools of medicine, so that the medical profession and hospital administrators are now well prepared to consider the application of this convenient tool of clinical practice for the purposes of preventive medicine as well as for the indispensable comparability of clinical experience and record

At the meeting of the Health Assembly of the United Nations in Geneva in July, 1948, an international list of diseases and conditions was adopted, as proposed by the Interim Commission of W H O In the meantime there was set up in England in the very midst of the war, in 1944, an experimental project of morbidity reporting in the area including Oxford, from the results of which the Register General Office of Great Britain has published monthly bulletins of disease incidence which have given useful data upon the ebb and flow of current disease, on the basis of voluntary reporting by a sample of the general population

On May 13, 1947, the following resolution was passed by the Board of Health of the City of New York

> WHEREAS, the Department of Health has no authority under the Sanitary Code of the City of New York to require the reporting of general illnesses and accidents, other than certain specified communicable and occupational diseases, now therefore be it
>
> RESOLVED, that inadequate knowledge of the presence of many diseases of a possibly preventable character, some of which only rarely result in the death of the patient and so escape official recognition, be brought to the attention of His Honor, Mayor William O'Dwyer, and that he be requested in the interest of the health of the people of the City to provide for the reporting to a central statistical bureau of the Department of Hospitals, of all discharge diagnoses of all patients admitted at any hospital or dispensary in the City of New York, whether tax-supported, voluntary, or proprietary, except those diseases required to be reported by these institutions to the Department of Health, and be it further
>
> RESOLVED, that the information obtained by this system of general morbidity reporting be kept confidential, and be made available currently to the Department of Health to permit its more effective application of the science of preventive medicine for the benefit of the public health

Further administrative consideration has resulted in the assignment of the requested undertaking to the Department of Health, where there are certain facilities of a statistical character particularly appropriate to the purpose

The Department of Hospitals has, for

expert radiologists The greatest dangers are in the field of therapeutics In treating malignancies, large doses are sometimes necessary, and this added risk is justified when experts are at the controls Even when the prognosis in a case of malignancy is hopeless, it is important to avoid, if possible, adding the misery of an x-ray burn, leukemia, or aplastic anemia

In the treatment of benign conditions, x-ray and radium should be reserved for those rare cases not responsive to any other form of therapy Every type of medical treatment should first be tried patiently, and for some time Even time itself may cure "strawberry marks" and M audoumi The editorial concludes, "Roentgen treatment for benign conditions should be used only with a vivid appreciation of its capacity for harm, and with an overt evaluation of its presumptive benefits, weighed against known and possible injuries inseparable from its use in effective dosage"

A Neurologist Looks at Discipline Every successful physician has practiced consciously or unconsciously, psychology and psychiatry Likewise, it is used by every mother in the nursery, by commanders on fields of battle, by salesmen, athletic directors, and, indeed, in all games, including poker

A recent article by a distinguished neurologist indicates that the very latest and most authentic information concerning the means of improving human behavior coincide exactly (almost verbatim) with the teachings of Christ, written nearly two thousand years ago, and with much of the moral teachings of Confucius, written five hundred years before that [1] The chief difference between the ancient and the modern (scientific, experimental) guides to correct human behavior is the simple, direct, incisive language of Christ and Confucius, and the involved, circuitous, and bewildering "gobbledegook" of some dissertations on psychology and psychiatry

A few quotations from this excellent paper will illustrate the return of modern teaching to the solid moral basis of the ancients "He stubbornly strives to gain the whole world but loses his own soul," "For the successful rearing of children, the prime essential is love" He advocates transmitting by precept and example those spiritual qualities of "honesty, love of truth, devotion to duty, loyalty, courage, diligence, unselfishness, respect for just authority, tolerance, and concern for the rights of others" "Utilize reward and punishment to build into the child those virtues which parents cherish" "To forgive a child for lying is to teach him to lie To punish cruelty and injustice one day and condone them the next is to teach cruelty and injustice" The rules of behavior should be enforced regularly

It is the hope of the author that we may pass on to our successors a moral civilization through decent teaching and discerning discipline This valuable article deserves careful reading by all physicians for its refreshing outlook, clear thinking, and understandable language, pointing a return to fundamental principles for improving human behavior by means that have stood the test of time

Costs of Medical Care We are pleased to present the following excerpt from the *Harvard Medical Alumni Bulletin*, January, 1949, issue

> Today when the costs of medical care are nearing comparatively astronomic levels, it is encouraging to be able to report on an unusual and refreshing philosophic approach to the problem Every trustee of a voluntary hospital has by now considered the ultimate effect of the rising costs of hospital housekeeping, plus the increasing expenses attributable to new therapies and drugs, in the light of increased taxation and declining capital gifts The legislation to nationalize hospitals in Britain, New Zealand, Australia, France, Sweden, and other countries provides a ready, though, to a very large extent, unpalatable solution.
>
> The trustees of the Massachusetts General Hospital have inquired into the possible methods of reducing hospitalization requirements Only one answer has been found To reduce by means of research the number and the morbidity of diseases. It is not generally appreciated, for instance, that were the incidence of typhoid and paratyphoid fevers at the level of only a few years ago the cost for the nation would be about $45,000,000 instead of less than $1,000,000 as in 1947 Other examples such as diphtheria and lobar pneumonia are readily discovered
>
> The trustees of the Massachusetts General Hospital are therefore actively engaged in a campaign not to add more beds, which would further drain the capital funds, but to erect a research building, from which, it is hoped, may come advances in science that may some day decrease the need for hospital beds.

[1] Mosher, Roland P. J.A.M.A. 135 399 (Oct. 18) 1947

against occupational hazards and accidents, will combine to improve longevity There will be a greater chance of survival from birth to later ages, and we may expect that this advance will continue

With population increase, there will be more people in time to come—chronologically old, if not otherwise—what is to be done to make these advanced years useful and happy? The medical and public health aspects are already receiving attention But the basis of good health in old age is laid during childhood and adolescence, debilitating disease, no matter when it occurs, must be attacked and, necessarily, we must acquire greater knowledge about the means and methods for accomplishing this

A new branch of medicine has been created, "gerontology," defined as the science of the physiologic and pathologic changes incident to old age Supplementing this is another term with which the physician must familiarize himself, "geriatrics," which is the specialty devoted to the treatment of the diseases of this period However, in view of the activities and frequently the good health of the older group, it may become difficult to define where old age really begins The social security regulations for their purposes proclaim that an individual should participate in its benefits (sic) at 65, the teaching profession concurs But that is not the measure, perhaps the arterial, rather than the chronologic age will evolve as the deciding factor In the meanwhile the situation may adjust itself, notwithstanding governmental or other injunctions. Those who have or are reaching an age which, formerly, placed them in a separate and dependent class, evidently need not despair—they seem to be holding their own, and the Biblical designation of "three score years and ten" as an "indicator" may require revision

Current Editorial Comment

Breast Feeding in Erythroblastosis The treatment of the infant with this unfortunate complication has been viewed with trepidation, and such babies have been weaned in the belief that maternal antibodies are destroyed by the infant's gastric juices or absorbed into the blood stream A study by I A B Cathie, at the Hospital for Sick Children in London, disclosed that this practice is not warranted [1] When the fasting gastric contents from 20 infants (one week to one year of age) were incubated with an equal volume of serum of a high Rh antibody titer for one hour at 37 C, no fall in titer occurred in any case Hence they are not easily destroyed by the child's gastric juice, nor did additional experiments disclose a demonstrable absorption into the circulation When an Rh positive volunteer drank 15 ounces of serum with an anti-Rh titer of 226, no untoward effects were noted—the serum did not sensitize other Rh positive cells When an erythroblastotic infant was fed high titer serum on one occasion, and breast milk with an anti-Rh titer of 32 on another, for 24 hours subsequent to a negative Coomb's test, no antibody was demonstrable and no red cells became sensitized This portion of the investigation was repeated, using incomplete or blocking antibody, on infants with hemolytic disease with the same result

The value of breast milk in every possible case should develop a spirit of hesitancy in promulgating the usual direction to take an erythroblastotic baby off the breast The results noted above should be subjected to further observations

X-Ray Hazards Those who employ roentgen rays for any purpose should know that, for good or ill, they guide a mighty force Theirs is the responsibility constantly to keep abreast of the latest discoveries, inventions, and means of control Only highly trained, full-time specialists can qualify, with the necessary experience, knowledge, and judgment, safely to administer these powerful agents (x-ray and radium), whether as an aid to diagnosis or as a means of treatment It is only natural then that the sad effects of those hazards are greater among surgeons and general practitioners using the smaller types of x-ray machines with less effective controls

In a recent editorial, those hazards were thoughtfully analyzed [1] The least danger is in the field of diagnosis, because of the brief exposures and the care exercised by

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S. Moore, M D , Editor

Emotional Conflict and Appetite

The *Oxford English Dictionary* defines appetite as a "physical craving or desire It is the determinate desire to satisfy the natural necessities or fulfill the natural functions of the body, one of its instinctive cravings which secure the preservation of the individual and the race "[1] It is well known that emotions influence appetite In recent years this influence has occupied the attention of many competent investigators [2-4] "The *emotions* are the feelings aroused by stressful situations, typically described as rage, fear, sorrow, love, and loneliness, but often mixed "[5] Anxiety is a kind of fear, and is one of the most common of the emotions Strong emotions are likely to cause functional changes in both mind and body, such as a diminution or loss of appetite Homesickness, for instance, may cause a complete loss of appetite The feeling of homesickness and abandonment may so affect the autonomic nervous system that not only will there be loss of appetite but there will be a feeling of nausea as well, perhaps even vomiting Once homesickness is cured, appetite returns

It is an interesting fact that anxiety will, under certain circumstances, cause an increase in food intake, and under other circumstances it may have exactly the opposite effect Anxiety usually results from emotional conflict, such as a state where there are conflicting desires, or fear of being unloved If anxiety is increased to a point where it becomes a recognizable symptom, mental unrest or suffering is experienced. Without special education, the individual may not realize that he or she is anxious, instead they see only the resultant symptoms Such persons may find themselves raiding the icebox, constantly nibbling, and frequently overeating, in addition to experiencing other symptoms This increased caloric intake often causes obesity Practitioners who treat obese patients usually find they have difficulty in getting these patients to remain on a reduced calorie diet The reason for this is that eating relieves the anxiety, and when anxiety is relieved the individual feels comfortable Some persons go on eating sprees just as others go on alcoholic binges There are other ways of relieving anxiety, but eating is one of the most common and most universal [3 6]

In other individuals, anxiety may cause a loss of appetite Anorexia nervosa is a classical example of this phenomenon in its extreme form.[7] Patients suffering with this type of emotional conflict find not only that they cannot eat, but that the very sight or thought of food is disgusting to them This may become a very serious medical problem, often resulting in death [5] In this disease, the symbolic nature of food is clearly recognizable Patients suffering from this type of response crave affection and understanding Their rejection of food is ofttimes symbolic of a feeling of rejection, and it is frequently necessary for the physician to spoon-feed such individuals when these patients are at last able to consider taking nourishment The understanding physician must give mental relief before the anorexic patient can again tolerate the idea of food

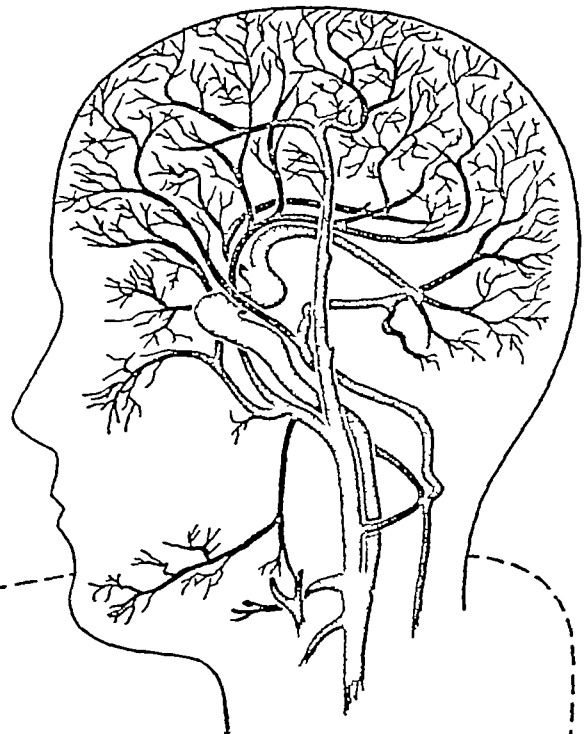
The psychologic relationship of food and love was discovered by early workers in the field of psychology In addition, it is now universally recognized that what goes into the mouth or what happens to the mouth and the oral cavity is of great significance to the individual An infant's hunger and the frustration resulting from such hunger is relieved by sucking at the breast Early oral erotic impulses are closely associated

ADVANCES IN PHYSICAL MEDICINE

From the Department of Rehabilitation and Physical Medicine
New York University College of Medicine
Howard A Rusk, M D , Director

Rehabilitation of the Amputee

In providing adequate care for the amputee, good surgery is not enough The physician must assume the responsibility for preparing the patient physically and psychologically for the amputation, see that the patient has proper instructions concerning stump care and exercise, that a proper prosthetic device is adequately fitted, and that the patient is trained in its use



One phase of the management of the amputee to which the physician should give particular attention is the immediate postoperative period while the stump is being shrunk in preparation for a prosthetic device Even though the stump will shrink considerably during this period, it will also shrink more during the first six months an appliance is used During this period of six to eight weeks, the patient should be given graduated conditioning exercises in preparation for both crutch walking and the later use of the artificial limb Exercises in preparation for crutch walking should be centered on the finger flexors, triceps, abdominals, and quadriceps Exercises for the important triceps muscles should consist of arm extensions and push-ups from the prone or sitting position while still in bed, or in a wheelchair Hand squeezing using the top bed rail, sand or a rubber ball will strengthen the finger flexors The quadriceps may be strengthened by first merely flexing the quadriceps, later raising the knee and later adding resistance Sit-ups, raising the feet while in the prone position, and trunk-twisting are recommended for strengthening the abdominals Resistance against pulleys provide an effective method for exercising the stump

During this early period, measures should also be taken to prevent anatomic deformities For example, it is not an uncommon practice in many hospitals, following an above-knee amputation, to elevate the stump upon a pillow However, if such elevation is maintained for as long as two weeks, a flexion deformity will occur which will take from six to eight weeks of arduous, painful work before sufficient hyperextension can be regained for satisfactory walking The use of short crutches in bed and later on a mat will help prepare the patient physically and psychologically for later crutch walking The physician should caution the patient while he is on crutches to protect the stump A fall with a resulting hematoma and infection may necessitate reamputation A stump protector should always be worn during this period • The physician should also advise the patient as to the necessity for bathing the stump twice daily and changing stump socks daily

In advising his patient on the selection of a prosthetic device, the physician must be aware that not all limbs are suitable for all amputees Many amputees have never worn an appliance because someone has told them that they could not use an artificial limb Others, who never should have had a limb and were advised to get one, have never been able to use their appliances, and have discarded them An amputee cannot be expected to accomplish things beyond his capacity and ability It is better to underestimate the capabilities of an amputee and have him say, "See what I have accomplished," than to build his hopes too high and have him become disappointed and discouraged The physician must realize that not all amputees can wear artifical limbs profitably It has been noted that an above-knee amputee in the older age group cannot, as a rule, profitably be trained to use a prosthetic device if he is unable to perform a swing-through gait on crutches

The physician must point out objectively to the patient those skills which the patient can expect to achieve with proper training,

RUPHYLLIN®

. . . acts to preserve the integrity of the capillaries —particularly useful for prevention and treatment of capillary fragility in hypertension, arteriosclerosis and diabetes mellitus

FORMULA	Aminophyllin	100 mg
	Rutin	20 mg
	Phenobarbital	15 mg

DOSE Ruphyllin is recommended in doses of one tablet three times a day This dosage, however, may be increased to two tablets three times daily as the needs of the patient indicate, it may be administered safely over prolonged periods of time

RESEARCH IN THE SERVICE OF MEDICINE

with food How oral needs are handled on the part of the person in authority (usually the mother) during the infant's early years will have a lasting significance on the individual's behavior pattern throughout life Especially does it influence the individual's eating habits, and his need for food and love Rigid feeding schedules that disregard hunger in the infant may in later life make food a "whipping post" for frustration and anxiety

The symbolic significance of food is seen in rituals involving family relationships and social traditions Many friendships are cemented by "breaking bread together," and countless worthy projects are launched with ceremonial banquets

In a recent study of undernourished starving men, a marked influence of appetite on emotion was observed These men had intense preoccupation with food or its symbol Common manifestations of this preoccupation were daydreaming or a sudden interest in scientific agriculture [8]

It is not the purpose here to discuss abnormal psychologic reactions, but it may be mentioned in passing that psychotic patients frequently develop delusions about food, and there are those who feel that food will poison them or cause other disastrous effects when taken into the mouth Other delusions associated with food are that eating will cause pregnancy or that the food will unduly influence behavior It is a matter of common knowledge that depression causes a loss of appetite This merely serves to establish further the deep psychologic relationship between emotions and appetite

The great emphasis which parents mistakenly put on the young child's eating habits may cause unconscious personal reactions in later years "You must eat this in order to be healthy" "If you don't eat this and so you will not be well" "You must eat to be big" "If you don't eat this something will happen to you" In such *seemingly* harmless statements, foundation is laid for the adult's neurotic reaction to his nourishment later in life Unconscious feelings of guilt arise when a person does not eat some particular food, misses a meal, or partakes of a "new" article of food

With further understanding on the part of adults of the relationship of emotional conflict to appetite will come more healthy attitudes about food and eating Because appetite is so intimately associated with the instinct of self-preservation and the preservation of the race, this subject deserves the serious attention of physicians, educators, and parents

ADVANCES IN PHYSICAL MEDICINE

[Continued from page 1270]

and those skills which the patient has little chance ever of regaining Extreme caution must be taken in the latter, however, as it is unwise to tell a patient what "he can't do," for this cannot be determined, in most cases, until the patient has had adequate training

Training in the use of a prosthesis is essential if the amputee is successfully to be rehabilitated Such training can best be done by a team consisting of the physician, physical therapist, occupational therapist, and prosthetics specialist

ALZHEIMER'S DISEASE WITH CASE REPORT

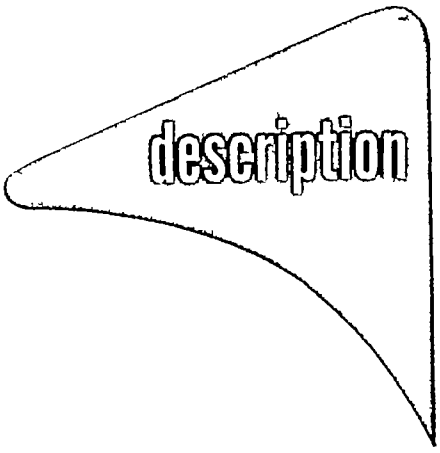
HAROLD R BRODMAN, CAPT (MC), AUS, and J H FRIEDLANDER, M D ,
Northport, New York

(*From the Medical Service, Veterans Administration Hospital, Northport*)

SINCE 1907, when Alzheimer described a "peculiar disease of the cerebral cortex," a considerable literature has accumulated, consisting chiefly of case reports [1] This has been very useful in clarifying the clinical picture of this syndrome but less so from a histologic standpoint because little has been added to the histologic description since Alzheimer The case history will continue to be useful, particularly in classification of this condition, and may also eventually throw some light on possible cause

Wilson defines Alzheimer's disease as an affection beginning about middle life, consisting of subacute mental involution conjoined with transcortical symptoms of agnosia, aprasia and speech disturbance, and sometimes with transient phenomena referable to projection systems [2] Confusion, restlessness, excitement, and hallucinosis are often prominent Lack of sphincter control without local impairment and one or another kind of fit may also occur

Speculation in the literature has dealt with (1) the relationship, if any, that this condition bears to senility, (2) the question of whether or not it is a distinct clinical entity, (3) the differential diagnoses of Alzheimer's disease, Pick's disease, and senile psychosis, and (4) the various theories concerning pathogenesis



The relationship to senescence is discussed by Ferraro and Jervis who cite the similarity of histologic findings in Alzheimer's disease and in senility [3] Stern and Reed state that Alzheimer's disease is only an aspect of the process of aging, and Jervis and Saltz believe the disease constitutes an early form of senile dementia [4,5] On the other hand Malamud and Lowenberg discount the prevalent belief in relationship to senility [6] They do not believe that senility as a concept could be limited to the central nervous system and further state that the age of a patient is not, and should not, be used as a criterion for diagnosis

That the belief in the relationship of Alzheimer's disease to senility is prevalent is indicated by the frequent use of the term "presenile dementia" as a synonym for Alzheimer's disease The presenium is considered to be from forty-five to sixty years of age Now this is arbitrary and bears no relationship to senility other than a chronologic one It certainly has no relationship to the physiology of aging Yet a great reluctance to depart from the concept of relationship to senility or age is evidenced by the coining of the term "juvenile form of Alzheimer's disease" when the histologic picture of Alzheimer's was found in a still younger age group Barrett states that it is difficult to limit disease processes by age periods and believes that senility is not a matter of years, but of tissue aging, and that there seems to be no difference in the plaques and neurofibril changes in the senile and presenile other than a difference of degree

Many of the case reports were questioned by other investigators as to whether or not they were actually cases of Alzheimer's disease, the assumption being that this condition was a distinct clinical entity This assumption is by no means unanimous Stern and Reed, in support of their contention that Alzheimer's disease is not a well-defined clinicopathologic entity, point out that intracellular neurofibrillary changes similar to those described by Alzheimer in senile and presenile dementia have been seen after starvation, after extirpation of the thyroid and parathyroid, and in cholera, dysentery, and uremia [4]

Jervis, in all his reports, considers Alzheimer's disease as a definite clinicopathologic entity, although he does state that agreement is lacking as to the clinical and pathologic features of the disease [2,5,8] Kufs reports a case of an early form

deproponex®

deproteinated pancreatic extract

Relaxes smooth muscle spasm within three minutes following intramuscular injection Provides direct, physiologic relief of pain due to many types of smooth muscle spasm

Relief of pain in intermittent claudication and primary dysmenorrhea, prolongation of claudication time in peripheral vascular disease Relief of renal and ureteral colic due to stone, stricture, kink or spasm Relaxation of ureter to permit instrumentation, X-ray examination

Sharp & Dohme, Philadelphia 1, Pa.

illy, and euphoric, smiling, laughing, whistling, inging, and grinning foolishly He was diagnosed lementia precox, hebephrenic type, and transferred o the Bedford Veterans Hospital in October, 1945

At the latter hospital he was inaccessible, appreiensive, irrelevant, and confused. He was unable o dress himself and did not care what became of imself He bumped into everything on the ward. At times he yelled incoherently, bleated like a sheep, nd smeared excreta on himself and on the walls He was retarded in his answers to questions, seemed nuddled, and mumbled a few words He was disoriented in all spheres He showed psychomotor etardation but had numerous compulsive movenents. He was unable to dress or undress himself He heard voices saying "go home, go home." He eceived 14 electric shock treatments without mprovement, remaining noisy, assaultive, and self-ibusive. He required frequent restraint Physical nd neurologic examinations at this hospital were legative. He was diagnosed dementia precox, nixed type, and transferred to the Veterans Administration Hospital, Northport, on October 25, 1946

Past History —The patient was born in New York City and was described as being a healthy, quiet, self-sufficient child who got along well with his ublings. The patient's father died when he was ine years old and his mother a short time thereafter This broke up the family, and the patient vent to live with an older sister He worked as a ootblack after school, participated in sports, and vas graduated from junior high school, being considered a good student After graduation he vorked as a laundry truck driver for eight to nine ears but lost his job in 1931 In 1933 he joined the Civilian Conservation Corps for one year He contracted gonorrhea in 1934. Prior to his induction ie held various jobs, always maintaining a good ecord. His preinduction personality was friendly nd outgoing, interested in his environment He vas stable in mind, aggressive, decisive, and spontaneous, accepting and adjusting to new situations

The patient had a casual attitude toward entering the army For eight months he worked as a crewman on a 37-mm. antitank gun Once he was thrown into the air by an exploding shell but got up and walked away without ill effect He was sent overseas to Burma where, for nineteen months, he served in various capacities, always serving well, until a short time before his hospitalization when he was transferred from outfit to outfit There are no records of courts-martial or AWOL's

Family History —The patient's father was born in Italy in 1873 and was killed in 1918 in an accidental fall. His mother died of a "broken heart," three years after the death of her husband The patient was the fifth of nine children. There are no neuropsychiatric determinants in the family

Social History —The patient was an occasional drinker He had regular heterosexual experiences and had a "steady girl friend" before induction into the army He was never married.

Mental Examination —On admission to Northport the patient was in an excited state, kicking out wildly and screaming in an inarticulate wailing manner, especially when attempts were made to move or direct him. The expression on his face was one of confusion His mouth hung open, and he smiled vaguely when spoken to in a soothing tone In restraint he tried to assault all who came in contact with him He was incontinent of urine and feces He ate well, including everything put within reach of his mouth His attention could be caught by calling him by name He looked at the examiner and answered simple questions with "yes" or "no," in such a manner that it was felt that he did not comprehend the question From time to time he yelled incoherently and at times made conversation in thick incomprehensible tones An occasional word, such as "shoes," "good kid," "you handle me like a kid," or "you go home," was discernible His emotional state was thought to be one of diffuse anxiety and fear because of his inability to comprehend or interpret his environment, a catastrophic reaction to external stimuli

Physical Examination —This revealed a markedly emaciated, sallow-complexioned young white man, 5 feet 6 inches tall, and weighing 87 pounds There was marked generalized muscle wasting Examination of the heart and lungs was negative Fundoscopic examination showed moderate retinal arteriosclerosis The disks were sharply outlined and normal in color There were no other significant positive physical findings

On neurologic examination there was increased muscular irritability There was generalized muscular wasting Speech was thickened, blurred, and incomprehensible There was a fine tremor of the tongue Gait was slow and hesitant, and patient fell when left alone The patient exhibited repetitive sucking and swallowing activity of a reflex nature. The deep tendon reflexes were hyperactive and equal bilaterally It was impossible to gain the patient's attention for a sensory examination

Course in the Hospital.—During his stay at Northport, the patient was agitated, assaultive, and confused. He remained out of contact, screaming unintelligibly He was given a sodium amytal interview but showed no response The patient was treated with constant sedation, either chemical or hydrotherapeutic, high vitamin regime, and potassium chloride with no response He showed a progressive downhill course. He was incontinent of urine and feces In January of 1947, the patient had two generalized convulsive seizures, one day apart, lasting thirty seconds and two minutes each, respectively The patient eventually developed penumonia which did not respond to penicillin or sulfadiazine, and he expired on April 7, 1947, at the age of thirty-seven, three years after the onset of his present illness The premortem diagnosis was psychosis with organic brain disease

Laboratory Examinations.—Blood count, urine, and stool examinations were negative except during the febrile episodes Spinal fluid examinations showed normal pressure, globulin normal, 1 cell per cu. mm., total protein 25 5 mg per cent, gold curve zero in all dilutions, and Wassermann negative.

of Alzheimer's disease with what he believes were incidental findings of sclerosis of the olivary bodies and severe atrophy of the basal ganglia [9] However, it is possible that all the findings in this case were due to a single etiology He infers that there is no specificity in the histologic findings of Alzheimer's disease, since argentophilia is typical of all metabolic products deposited in the glial substance

Numerous papers have been written on the differential diagnosis of Alzheimer's disease These are concerned chiefly with differentiation from senile dementia and Pick's disease, both from a clinical and histologic standpoint Marchand differentiates Pick's disease from Alzheimer's on clinical and pathologic findings and states that the diagnosis may usually be made during the life of the patient [10]

Although the pathologic findings in Alzheimer's disease are somewhat different qualitatively from Pick's disease and differ quantitatively from senile dementia, the clinical differentiation is not one which can be made with any degree of certainty Bonfiglio differentiated clinically Alzheimer's and Pick's diseases as follows In Pick's disease there is an aphasia with gradual reduction of word material resulting in almost complete mutism (transcortical sensory aphasia), whereas in Alzheimer's disease there is a diffuse, all-round deterioration of speech of no particular pattern, with paraphasia, verbigeration, and logoclonus [4] This description sounds fairly clear-cut, but such clarity does not often obtain clinically Wilson, who admits the difficulty of clinical differentiation, suggests that intense motor activity is more characteristic of Alzheimer's disease than Pick's [2]

Jervis differentiates Alzheimer's disease from senile dementia on the histologic finding in the former of an intense microglial reaction around and within the characteristic plaques [5] He finds numerous microglocytes, showing severe degenerative changes, encroaching upon the Alzheimer's plaques This was not present in senile dementia There have been excellent clinical and histologic descriptions with differential diagnoses of Alzheimer's disease, senile dementia, and Pick's disease in the published reports and texts in considerably more detail than can be given here [2 7 11]

In discussing possible causative factors of Alzheimer's disease, we enter into the realm of conjecture In Malamud's second case, that of a fifteen-year-old boy, he points out that besides the typical findings of Alzheimer's disease, namely profusely distributed argentophil plaques and neurofibrillary changes, there were striking changes in the choroid plexus, the vessel walls being greatly thickened with thick proliferation of connective tissue around the vessels.[6] It w concluded that the entire histologic picture this case could be explained on the basis of primary vascular disease, the brain changes bein secondary to the changes in the choroid plexu This has not been particularly substantiated, no was it found in the case reported here

Lowenberg and Waggoner have suggested tha cases occurring before presenium with neuropathic familial history may in certain instances be of heredodegenerative origin [12]

Another interesting etiologic speculation is advanced by Braunmuhl who states that it is possible that the changes in the brain are the changes seen in any colloidal system, a dispersed colloidal state changed to a less dispersed state and eventually to condensation and coagulation.[11] This process, known as syneresis, is characteristic of the aging of any colloidal system, and what is known as a syneretic process in colloidal chemistry is equivalent to an atrophic process in neuropathology The following, an unusual case from the standpoint of age, presents most of the clinical and pathologic criteria of Alzheimer's disease

Case Report

The patient, a thirty-four-year-old white man, was first hospitalized at the request of his commanding officer on February, 1945, while stationed in Burma The commanding officer stated that the patient was "completely useless and acted in an unacceptable manner He couldn't adjust to any type of work or get along with his fellow soldiers. Private X is apparently simple-minded. He cannot be used on any job because he does not realize the responsibilities of such work. He wanders off on any job He eats from other men's mess kits, thinking that he has his own. He doesn't shave unless told to do so, doesn't bathe unless told to do so He gets lost from his own tent and his own bed and wanders about"

While hospitalized in the China-Burma India theater, the patient stated that the other men were picking on him and throwing powder at him. He complained of vague pain in his nose and back. The patient was quiet and cooperative although he remained seclusive At times he seemed dull and apathetic and at other times intense and apprehensive He was also confused, his memory was poor and he was disoriented as to time and place. He was unable to recall more than three digits and could not do the simplest calculations He was given the Kent Emergency Test and scored at seven years. He was diagnosed dementia precox, simple type, and sent to the United States where he was admitted to the Mason General Hospital in June of 1945

At Mason General Hospital he was restless, over active, silly, and unable to care for himself It was reported that he had auditory hallucinations. At this hospital he received 18 electric shock treatments but remained loud, boisterous overactive, restless,

FIG 3 Section of left superior frontal lobe showing numerous argentophil plaques (low, Bielschowsky's stain)

spinal cord at the pyramidal decussation and high cervical cord below the pyramidal decussation

The sections stained with hematoxylin-eosin and those stained with Nissl's method showed marked alterations in the neurons of the cortical areas and, to a lesser degree, in the basal ganglia. In the cortex there was a conspicuous decrease in the number of the neurons

Those that were present showed changes in shape, size, position, and structure. The cell bodies were distorted, narrowed, and twisted, and many apical dendrites of pyramidal cells were wavy or spiral. In several cells the triangular form was altered to that of stellar

Due to the narrowing there was a diminution of size, a definite shrinkage, showing many stages to the point where the cells were hardly identifiable

The polarity of the cells was upset, some deviated at a sharp oblique angle, others at about a right angle, while some at an obtuse angle to the stage where the cell became inverted in relation to the general pattern. In this positional alteration the usual layer arrangement was lost, and the cortex was represented by a thinned-out rim. In those cells where they were still identifiable, there was eccentricity of nuclei. The chromophilic substance was mostly fine, powdery, hazily defined, or absent With these neuronal alterations there was no satellitosis, no neuronophagia was observed.

The Holzer stain showed mild gliosis at the superficial border of the occipital cortex. In the other areas there were no excessive glia-fiber formations visible.

In the choroid plexus of the left inferior horn two psammoma-type bodies were found. In that area there was an increase of connective tissue fibers Elsewhere the tufts were well developed, and the cuboidal cell layer covering the pial stalks showed the usual arrangement

For the staining of the myelin, Weil's method was used There was no deviation from the usual in the distribution of the myelin in any of the sections

The most conspicuous alterations were found in the sections impregnated with silver by Bielschowsky s method. These alterations were twofold

1 Widely disseminated throughout the cortex of every part of the cerebrum and present more moderately even in the cerebellar cortex there were innumerable areas, mostly round, some oval, ranging from about 30 to 100 microns in diameter They were darkly colored on a tobacco-leaf gold background Most of them contained a more or less centrally placed, round core, around which there were irregular fragments of filamentous and granular substance, seemingly radiating from the central core toward the periphery This substance was denser at the outside rim, leaving a looser network or halo which was concentric with the core and the outer ring Some of the areas resembled a miniature wreath

2 In the remnant of the cerebral cortex, left among the widely and densely scattered argentophil formations, there were pyramidal cells whose neurofibrils were matted together at the periphery of the cells and darkly colored by silver The rest of the cell bodies, including the nuclei, were pale, golden yellow, and structural details could not be distinguished.

At many places the bunched-together, fused, sharply outlined neurofibrils formed loops and even twisted and intertwined filaments which assumed the appearance of a loosely woven basket in the shape of a former neuron, without any other identifiable remnant of the cell, however Indeed, occasionally only a dark, thick fragment of fused neurofibrils in the form of an inverted question mark was left of the pyramidal cell

Diagnoses.—Generalized brain atrophy, fenestration of the septum pellucidum (congenital), internal hydrocephalus, and presenile psychosis (Alzheimer's disease)

Summary

A case is presented which exhibited the clinical and pathologic features of Alzheimer's disease This case is unusual in that the disease manifested itself at the early age of thirty-four This case then becomes part of the so-called group of "juvenile forms" and lends weight to the small group of cases already described as being independent of the presenium These cases are important in considering the problem of the pathologic nature of Alzheimer's disease

The mental reaction this patient manifested was one of a slowly advancing dementia At an early stage he could not adjust to his environment or accept responsibilities Later he developed

FIG 1 Left frontal lobe illustrating neuron and fibrillary changes seen in four characteristic cells (high, dry, Bielschowsky stain)

Blood complement fixation test and precipitation test for syphilis were negative

Blood cholesterol was 267 mg per cent, and the bromsulfalein test was negative X-rays of the skull, spine, and chest were negative A gastrointestinal series showed a mild nutritional deficiency pattern of the jejunum manifested by distinct jejunal hypermotility

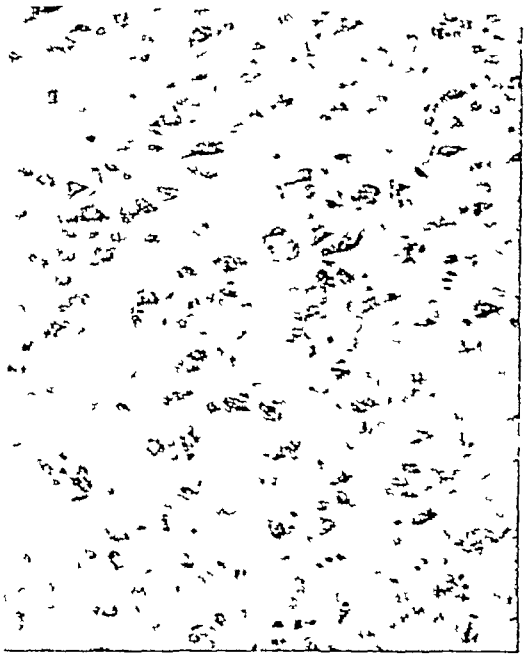

FIG 2 Section of left upper frontal lobe (low, Nissl stain)

Electroencephalogram during the few minutes when the patient was quiet showed a completely flat record with no alpha rhythm. This was reported as being suggestive of cortical atrophy

Postmortem Findings —Autopsy revealed bilateral confluent bronchopneumonia, generalized emaciation, atherosclerosis of the aorta, and atrophy of the testis However, on section of the testis the histologic picture was normal. There were no pathologic changes in the pancreas, suprarenal glands, or prostate

Gross Description of the Brain.—There was a generalized decrease in the size of the brain with some asymmetry It weighed 1,030 Gm. The left occipital pole was shorter than the right. Between the dura and pia mater there was an additional tan-gray, filmy membrane which was stripped with only moderate resistance from the undersurface of the dura. This membrane was about 1 to 2 mm. thick, and it extended from the region of the superior longitudinal sinus over the right and left cerebral hemispheres to the floor of the anterior and middle cranial fossa but not across the floor of the fossa. This membrane did extend across the dorsum of the cerebellum. There was some milky cloudiness of the pia over the parietal regions The cerebrospinal fluid was somewhat increased in amount It was clear and colorless

The 3 cm of the cervical spinal cord obtained were pigmented brown The blood vessels at the base of the brain had only slight fibrous and fatty changes

The right and left ventricles were markedly dilated throughout In the inferior horns the hippocampi were narrower than usual. There, as well as in the occipital poles, were areas where the dilated ventricles were separated from the surface by only 2 to 3 mm of brain substance

At about the middle of the septum pellucidum, there was an oval opening in each membrane. The openings were about 4 by 6 mm. in diameter and led into the cavum septi pellucidi, thereby establishing communication between that space and the lateral ventricles

The choroid plexi in the anterior parts of the lateral ventricles were thinner than usual. In the posterior portions of the inferior horns, they were about usual thickness

Microscopic Description —The following areas of the central nervous system were investigated histologically Of the cerebrum—left prefrontal, lateral, left frontal, superior (Figs 1-3), right orbital gyri, left caudate and lenticular nuclei, right caudate and lenticular nuclei, left central sulcus region, left inferior temporal lobe containing part of the inferior horn, right superior postcentral, left hippocampus, choroid plexus from the left inferior horn, hypothalamus, including the mamillary bodies, mesencephalon, pons, right occipital lobe (calcarine area), left occipital lobe (calcarine area), medulla oblongata and the choroid plexus of the IV ventricle, cerebellum—right hemisphere,

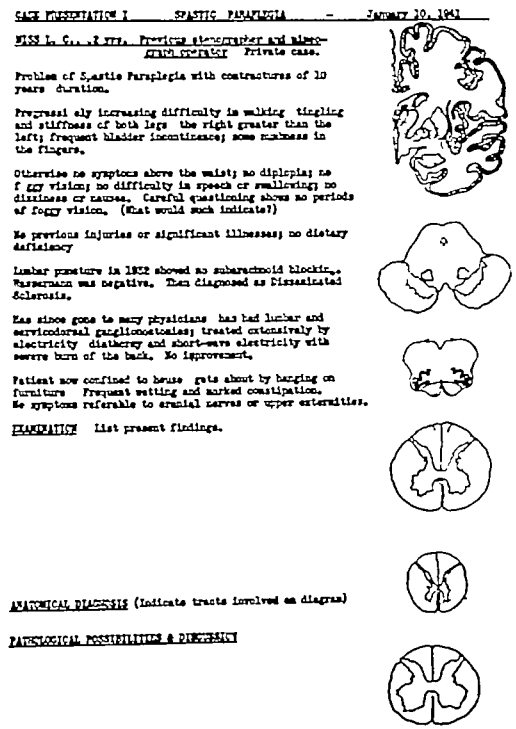
NEUROLOGY—UNDERGRADUATE TEACHING AND CLINICAL PRACTICE

WARDNER D AYER, M D , Syracuse, New York

THERE is at present a need for a greater neurologic interest and activity on the part of the internist and general medical man However, they often admit that they are poorly prepared and won't "put their hand to it" Much of this lack of interest reflects an earlier undergraduate disinterest

The third year student often approaches clinical neurology with resentment He has been repeatedly told that neurology is entirely built on that firm foundation of dread first year neuroanatomy which was once an almost insurmountable obstacle and which is still *terra incognita* to him He recalls how bitterly he suffered on that dreary trip around the rhinencephalon, that he strayed afield in the striae acousticae, was disconsolate and discouraged with Sherrington's integrations, and completely confounded by the differentiation between rigidity and spasticity in the *Macacus rhesus* monkey He then and there learned to dislike anything neurologic, and he doesn't take to it now

The teaching of neurology is relatively simple and can be very interesting It is only necessary first to review briefly and clarify this dread neuroanatomy, then teach long and well the neurologic examination, repeatedly show physical signs, and then give the important clinical entities with inclusive basic simplicity, on these the student can build intelligently Certainly there is no virtue in teaching all about the rare museum myopathies and dystrophies, the Westphal-Strümpell syndrome or Lindau's disease



In 1935 to stimulate a greater student interest the writer began to teach clinical neurology by a concise, laboratory work sheet, syllabus method as a supplement to accepted and recommended neurologic texts A course of sixty hours was planned as a simple practical presentation of the more important disorders of the nervous system with the main endeavor to correlate the early fundamentals and to stimulate individual student thought and deduction

The student compiled his own personal notebook consisting of the following

1 Twenty-five to 30 actual case presentations with mimeographed history notes on diagram sheets, each to be completed by the listing of the demonstrated findings with anatomic and pathologic diagnoses and the answers to appropriate analytic questions (Fig 1)

2 Twelve sharply summarized clinical chapters in outline form, emphasizing in each the pertinent points of anatomy, function, and pathology, particularly as they relate to symptoms and signs (Formal lectures are still a necessity and case teaching does not stand alone)

3 A series of 20 especially instructive illustrative case reports These and the foregoing sheets are supplemented by appropriate photostated diagrams from many sources (possibly plagiarism but with full credit indicated) and, in certain instances, by actual photographs of necropsy or operative findings

CASE PRESENTATION I SPASTIC PARAPLEGIA - January 10, 1941

MISS L. C., 2 yrs. Previous gynecologic and neurologic consult Private case.

Problem of Spastic Paraplegia with contractures of 10 years duration.

Progressively increasing difficulty in walking; tingling and stiffness of both legs the right greater than the left; frequent bladder incontinence; some numbness in the fingers.

Otherwise no symptoms above the waist; no diplopia; no foggy vision; no difficulty in speech or swallowing; no dizziness or nausea. Careful questioning shows no periods of foggy vision. (What would such indicate?)

No previous injuries or significant illnesses; no dietary deficiency

Lumbar puncture in 1932 showed no subarachnoid blockage. Wassermann was negative. Then diagnosed as Disseminated Sclerosis.

Has since gone to many physicians has had lumbar and cervicodorsal ganglionectomies; treated extensively by electricity diathermy and short-wave electricity with severe burn of the back. No improvement.

Patient now confined to house gets about by barging on furniture Frequent wetting and marked constipation. No symptoms referable to cranial nerves or upper extremities.

EXAMINATION List present findings.

ANATOMICAL DIAGNOSIS (Indicate tracts involved on diagram)

PATHOLOGICAL POSSIBILITIES & DIAGNOSIS

FIG 1 Specimen case presentation sheet (reduced 1/3) showing transverse diagrams which are to be filled in by student.

Condensed from a paper presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Neurology and Psychiatry May 21 1948.

memory impairment for recent and remote events At times he experienced visual and auditory hallucinations He became confused, disoriented, hyperactive, and showed prolonged restless periods His intellectual deterioration progressed so that the patient became completely inaccessible This patient exhibited focal cortical signs of aphasia, paraphasia, apraxia, and agnosia On neurologic examination he showed incoordination, increased muscular instability repetitive sucking and swallowing activity of a reflex nature, hyperactive deep tendon reflexes and, later on, grand mal convulsions

The pathologic picture of generalized atrophy of the brain, with the microscopic findings of the Alzheimer's argentophil plaques and neurofibrillary changes, conforms to the classic description of Alzheimer's disease

The cases in the literature have been presented in essentially the same manner, and the pathologic studies have all been practically uniform in the technic of section and staining Hence, little has been added to our knowledge other than numerous conclusions of a strictly speculative nature as to the pathogenesis of this condition

Alzheimer, in his original discussion of this condition, stated that "beyond doubt there were many more psychiatric entities existing than are listed in our textbooks In many of these bizarre cases, study in the future will reveal that they are to be differentiated from known entities Gradually these pathologic studies will enable us to define more sharply and to classify these cases from the large groups in which they find themselves today" This was written in 1907 and has proved to be true However, beyond the fact that Alzheimer's disease is considered by most observers to be a distinct clinical entity, little else has been accomplished This is unfortunately true of a great many neurologic problems It is also true, however, that a great many neurologic problems, previously obscure, were clarified when study was directed away from the postmortem histologic findings and toward a more organic approach, embracing vascular, metabolic, and chemical studies However, in order to do this the diagnosis of Alzheimer's disease must be made during the life of the patient

Prepared with the technical assistance of Mr E. Schmuckwitz.

TOXIC METALS CONSTITUTE INCREASING INDUSTRIAL HAZARD

Toxic metals are an increasing industrial hazard, according to Leonard Greenburg, M.D, New York, executive director of the Division of Industrial Hygiene and Safety Standards, New York State Department of Labor Writing in the March 26 issue of the *Journal of the American Medical Association*, Dr Greenburg says "The introduction of many new alloys and industrial processes has created environmental conditions wherein workers are often subjected to the dusts and fumes of toxic metals and the mists or gases of metallic compounds Rare metals which a few years ago were laboratory curiosities have suddenly assumed important roles in industry As a result, new disease entities are being encountered—for example, the pathologic manifestations (skin rash and skin ulcers, and irritation of the respiratory tract) resulting from exposure to beryllium, a metal almost unknown in industry as recently as ten years ago, and, in addition, exposures to old offenders are revealed in unexpected form. The toxic metals constitute an increasing industrial hazard because of the many new uses to which metals are being put. Prompt recognition of the industrial origin of the many obscure signs and symptoms, referable to almost any organ system of the body, is essential if the disease is to be diagnosed before irreversible changes have taken place."

Complete removal of the patient from exposure to the toxic metal or metals is usually necessary, even in mild cases of metal poisoning, Dr Greenburg emphasizes. Exposure to amounts of the toxic metals that would be harmless to well persons may be harmful to persons in whose systems the metals have already accumulated, he says. Although specifically physicians possess few drugs which are of value in poisoning from certain metals, persons suffering from arsenic poisoning and from acute mercury poisoning may be treated effectively with the chemical known as BAL, according to Dr Greenburg BAL, British Anti-Lewisite, was created to protect British soldiers against a feared German attack with lewisite

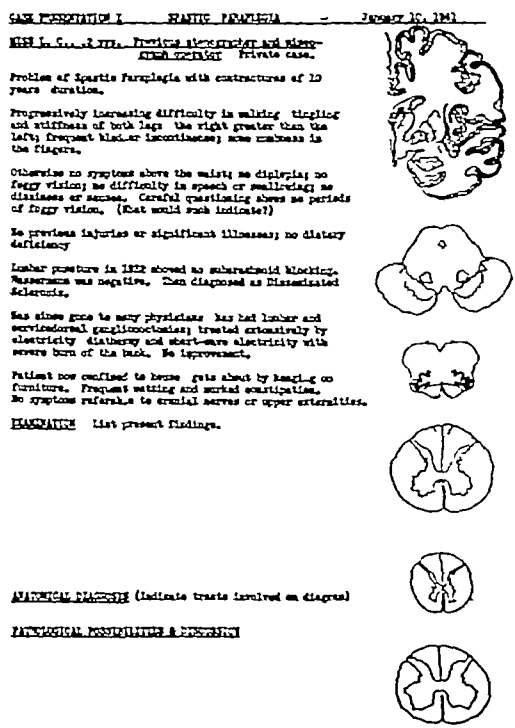
NEUROLOGY—UNDERGRADUATE TEACHING AND CLINICAL PRACTICE

WARDNER D AYER, M D , Syracuse, New York

THERE is at present a need for a greater neurologic interest and activity on the part of the internist and general medical man However, they often admit that they are poorly prepared and won't "put their hand to it" Much of this lack of interest reflects an earlier undergraduate disinterest

The third year student often approaches clinical neurology with resentment He has been repeatedly told that neurology is entirely built on that firm foundation of dread first year neuroanatomy which was once an almost insurmountable obstacle and which is still *terra incognita* to him He recalls how bitterly he suffered on that dreary trip around the rhinencephalon, that he strayed afield in the striae acousticae, was disconsolate and discouraged with Sherrington's integrations, and completely confounded by the differentiation between rigidity and spasticity in the *Macacus rhesus* monkey He then and there learned to dislike anything neurologic, and he doesn't take to it now

The teaching of neurology is relatively simple and can be very interesting It is only necessary first to review briefly and clarify this dread neuroanatomy, then teach long and well the neurologic examination, repeatedly show physical signs, and then give the important clinical entities with inclusive basic simplicity, on these the student can build intelligently Certainly there is no virtue in teaching all about the rare museum myopathies and dystrophies, the Westphal-Strümpell syndrome or Lindau's disease



In 1935 to stimulate a greater student interest the writer began to teach clinical neurology by a concise, laboratory work sheet, syllabus method as a supplement to accepted and recommended neurologic texts A course of sixty hours was planned as a simple practical presentation of the more important disorders of the nervous system with the main endeavor to correlate the early fundamentals and to stimulate individual student thought and deduction

The student compiled his own personal notebook consisting of the following

1 Twenty-five to 30 actual case presentations with mimeographed history notes on diagram sheets, each to be completed by the listing of the demonstrated findings with anatomic and pathologic diagnoses and the answers to appropriate analytic questions (Fig 1)

2 Twelve sharply summarized clinical chapters in outline form, emphasizing in each the pertinent points of anatomy, function, and pathology, particularly as they relate to symptoms and signs (Formal lectures are still a necessity, and case teaching does not stand alone)

3 A series of 20 especially instructive illustrative case reports These and the foregoing sheets are supplemented by appropriate photostated diagrams from many sources (possibly plagiarism but with full credit indicated) and, in certain instances, by actual photographs of necropsy or operative findings

CASE PRESENTATION I PLASTIC PARALYSIS January 15, 1941

Problem of spastic paraplegia with contractures of 10 years duration.

Progressively increasing difficulty in walking; tingling and stiffness of both legs the right greater than the left; frequent bladder incontinence; some numbness in the fingers.

Otherwise no symptoms above the waist; no diplopia; no foggy vision; no difficulty in speech or swallowing; no dizziness or nausea. Careful questioning shows no periods of foggy vision. (What would such indicate?)

No previous injuries or significant illnesses; no dietary deficiency

Lumbar puncture in 1932 showed no subarachnoid blocking. Wassermann was negative. Then diagnosed as Disseminated Sclerosis.

Has since gone to many physicians has had lumbar and cervicodorsal ganglionectomies; treated extensively by electricity diathermy and short-wave electricity with severe burn of the back. No improvement.

Patient now confined to house gets about by hanging on furniture. Frequent wetting and marked constipation. No symptoms referable to cranial nerves or upper extremities.

DIAGNOSTIC List present findings.

ANATOMICAL DIAGNOSIS (Indicate tracts involved on diagram)

PATHOLOGICAL CONDITION & ETIOLOGY

FIG 1 Specimen case presentation sheet (reduced 1/2) showing transverse diagrams which are to be filled in by student.

Condensed from a paper presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Neurology and Psychiatry May 21 1948.

4 The pathology is demonstrated when possible by gross specimens, otherwise by lantern slides from the writer's collection of both gross and microscopic material

5 One special four-hour period for sectioning of the hardened brain in the old Salpˆtrière manner

6 Questionnaire sheets are added from time to time for better orientation and review

This material when properly arranged and completed has made an individual spring binder textbook of real personal interest, pride, and value It is a student's own work Students have reported that in the subsequent years this value was enhanced by the addition of abstracts from the literature, reprints, interesting personal case reports, and particularly their own revisions

It has been the main intent to develop an expertness in history-taking, an accuracy in physical findings, an awareness of possibilities, and also a more systematic approach to other medical problems In addition, the importance of kindliness, patient understanding, and reassurance in the handling of all individuals has been stressed, with emphasis on the very great responsibility of keeping the chronic patient out of the hands of exploiting quackery

To repeat, the real major premise of this teaching is to spur the student constantly in his consideration of symptoms and signs to a clear visualization, a mind picture, of the underlying anatomic structures, the pathologic mechanics, and the "working of all the parts," and to think primarily and logically in such terms It might appear that the effort was to teach more of fundamentals and less of the clinical disease, but if this is so, it makes for the very "intellectual discipline" which is really a distinction of neurology!

What then have we taught? And what have we emphasized? Or have we overemphasized? The following lecture headings are here listed and briefly discussed These are given to each student in outline form

Lecture Headings

Historical Highlights—The evolution of our present neurologic knowledge and an interesting and cultural touch of medical history are presented with lantern slide illustrations from the famous Wolff Collection of Syracuse University (This consists of 15,000 portrait engravings of noted scientific men of all times up to and including Virchow in 1860) It is a matter of inspiration and interest to know of and to see the physiognomy of a few of these early pioneers and to know of their times Their early gropings, when helpless without knowledge of physiology and pathology, were really surprisingly good and in comparison serve to better fix our present-day knowledge Only one hundred years ago the phrenology of Gall and Spurtzheim was at its heighth It was a crude attempt at localization Certainly we have come a long way, but in what a short time!

Neurologic Examination—A most important chapter, it is the real sheet anchor of the teaching of clinical neurology *It is neglected* in the general course of physical diagnosis Without skill in this procedure the student is like a ship without a rudder The intelligent testing of the 12 cranial nerves and of the motor, reflex, and sensory status of the extremities of course must review and re-establish the entire anatomy and function of the brain, cord, and peripheral nerves

The writer's simple one-page examination form (Fig 2) is given without the listing of 36 reflexes—and what discouragement in the "six-pager"! Here they apply knowledge at first hand and use their own special senses—if they haven't atrophied from disuse They find that with training they can ordinarily make this examination in twelve minutes, that there is rarely a need of a forty-five-minute sensory study, and they also learn that a "reflexologist" or a "sexologist" is not a neurologist and that in these days of overspecialization there are too many amateur experts

In addition, they do not expect all diagnoses from an electroencephalograph "out of a satchel" or from other popular procedures and gadgetry, all too often thought infallible They learn the importance of the sensible, to-the-point history and what to ask for Without a good history they can't "make bricks without straw," and they are not overimpressed if a maternal grandparent had aneurisis or walked in her sleep!

The Brain Coverings and the Spinal Fluid—A valuable chapter which reviews the anatomy of the meninges, the arrangement of the ventricles, the subarachnoid space, the cisternae, and the formation of and circulation of the liquor cerebri A lantern slide review of the primary brain vesicles here is most helpful, this is also an excellent method to teach brain anatomy So we even revert back to embryology

The "sideline" lumbar puncture and the spinal fluid examination are illustrated in detail These two important procedures are much too often very poorly done

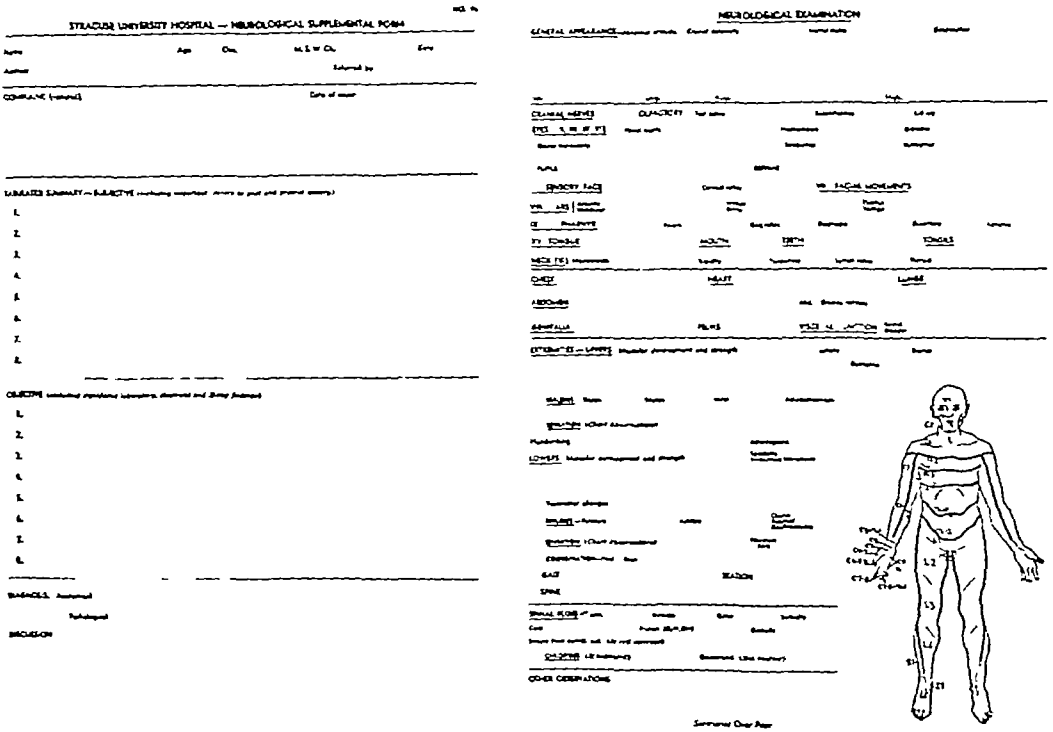


FIG 2 Neurologic examination form (reduced 1/2) Obverse summarizes the subjective and objective findings with diagnoses and discussion. Reverse is the reminder examination outline

Here then is retaught anatomy, embryology, physiology, and clinical microscopy, and of this how little they remembered! Without such knowledge there could be no intelligent and practical consideration or understanding of the meningitides

Meningitis —This chapter has been rewritten often in the past ten years This certainly is consequential medical neurology and demands, in addition to the preceding review chapters, a knowledge of bacteriology and inflammatory exudates Students know that a turbid spinal fluid demands an immediate and emergency smear, but can they do a Gram's stain? Also a real test of their knowledge is what to do with that less urgent spinal fluid with a 200 cell count and the question of its several implications

It is also surprising how many times the student doesn't recall that the low power of his microscope encloses one square millimeter, which is the unit of his counting chamber

The Spinal Cord and Its Diseases —General cord anatomy with its relation to the spinal column and the spinal fluid dynamics is demand knowledge What remarkable concentration of enormous vital control function is located in this, a lady's long finger of delicate soft consistency, hanging suspended in a bony canal! Here we must marvel at God's handiwork, and it is discouraging that so few students remember this most essential anatomy The anatomy, histology, and the long tracts are thoroughly reviewed by photostatic anatomic supplements and by cross-section exercise sheets, all of which are added to the notebooks

The grave responsibility which is carried in any case of progressing paraplegia is emphatically stressed The various disease possibilities and their differentiation with spinal fluid examination and dynamics are all carefully considered The cord tumor is still being missed and too often and too long masquerades as transverse myelitis or disseminated or subacute combined sclerosis Considerable time is given to disseminated sclerosis as an etiologic and pathologic enigma, and a difficult diagnosis not ever to be made at one sitting Students learn that the age of onset is under forty, usually under thirty, and in "brunette females" (wda), and is not to be confused with posterolateral sclerosis with onset over forty in gray-haired blondes!

Charcot's amyotrophic lateral sclerosis and its related progressive muscular atrophy are briefly and concisely given as a chronic and hopeless disease which the student must know, but other rare conditions along with syringo-

myelia and Fredreich's ataxia are only mentioned The Weigert slides of these may be instructive in demonstrating cord tracts, but they are not the important or frequent cord diseases such as the usual board examiner may indicate

Poliomyelitis —This chapter is given in considerable detail, perhaps because of the writer's longstanding personal interest in it It serves as an excellent review of the nature of viruses, of the lower motor neuron, and, especially important, the mechanics of respiration with a differentiation of the bulbar from the cervical cord respiratory paralysis It is then realized how fortunate it is that the phrenics have a high cervical cord level

Neurosyphilis —Here is a review of its early but post-Columbian history, the general nature of spirochetes, and the special characteristics of that darting, gleaming, twisting, pale spirochete, the Treponema pallidum, "the destroyer of the house," the Bordet-Gengou fixation of the complement, the general pathology, and the three-phase cerebral pathology of this disease Its therapy has now been rewritten several times to great advantage

Brain Dissection.—In a four-hour exercise a hardened brain is sectioned by two students each This is done in the Salpêtrière manner, filling in outline diagrams as advocated by Globus They do this with real enthusiasm, it registers mighty well, and they take home the brain stems in their pockets Many remark that only then did they arrive at a real practical concept of brain structure A similar anatomic review exercise on the heart would be a great help to every young cardiologist

Cerebral Localization.—This is reviewed with special work sheets, and its occasional treachery is remarked Aphasia is given most simply as motor or sensory phenomena, and its more complicated confusing and controversial discussion is avoided at this undergraduate level

Increasing Intracranial Pressure —This brings out a very practical review of cerebral blood flow and physiology Its mechanics and signs are stressed as of great importance in cranial trauma and other space-displacing masses Here we invade but supplement the surgical field

The Brain Tumor —The brain tumor is not common, later in practice the student may see but one or two a year However, it is covered quite fully with many illustrative case reports and photographs, because it serves an excellent purpose in bringing out, in addition to its variable symptoms and signs, an excellent review of brain anatomy, localization, and altered endocrinology The nature and types of headache and convulsive seizures are discussed

Intracranial Hemorrhage —The circulation of the brain is thoroughly stressed and reviewed with a detailed knowledge of the circle of Willis with its marvelous capacity for collateral supply The frequency of aneurysms in this location with their relationship to subarachnoid hemorrhage is pointed out The peculiarity of the thin-walled cerebral vessels with no media and practically no vasomotor supply is demonstrated, also that these vessels do not contract in spasm or dilate with stellate ganglion injection (popular ideas to the contrary)

Apoplexy, whether due to hemorrhage, to thrombotic closure *in situ*, or to an embolus whipped up from a heart or a lung, is the most frequent of all neurologic diagnoses Clinically it must be considered carefully in a more realistic anatomic, physiologic, and pathologic manner So much is done when there is so little to do! Only a few intracerebral clots lend themselves to surgical removal Indiscriminate angiography is severely condemned The importance of the collecting or venous sinuses and the bridging veins in cerebral trauma is accentuated, and the neurologic and pathologic aspects of cerebral trauma are thoroughly presented Again we have surgical overlapping but to its advantage

Extrapyramidal Tract Diseases, Encephalitis, Epilepsy, Neuritis, and Neuronitis —A discussion of these disease entities concludes these formal outline lectures

Case Presentations

The 30 to 35 actual patients that were presented covered a wide spread of clinical instruction, most often with no relation to the current lecture, but this was no disadvantage The case epitomizations were often prepared by the students, only they certainly had to be edited! The cross-section work diagrams were of a great help, as were the analytic questions and questionnaire sheets meant for crystallizing study, reference, and review Students did not walk out of a clinic and forget it

When these prepared sheets were assembled, photostats and photographs inserted, the notebook was completed Final grades were partly dependent upon this complete notebook This possibly reflects the old drawing book days of pathology or histology, but students still have to be checked and marked Coercion in graduate students should seem unnecessary, but such marking is unfortunately still unavoidable

Conclusions

Neurology is "slipping" as a sharply limited specialty of experts Such experts are, of course, needed, but there are too few of them Hence much of it is falling back into internal medicine, and the medical man must be better prepared for it

The brain is the most marvelous structure in the entire universe, a "holy of holies," and as a matter of pride it should be known better It has been neglected sadly

The writer is certain that there is overemphasis on the vast complexity of medicine, but even if such were true, it should not preclude an interest and more practical knowledge of neurology The need for more interesting, simplified, and stimulating neurologic teaching as a part of the department of medicine is stressed

---

SCOPOLAMINE IN VERTIGO

Lothar Wirth, M.D , Rensselaer, New York

DIZZINESS, at times associated with vague abdominal complaints, at times with nausea or vomiting, is a symptom complex frequently encountered in practice In itself neither diagnostic nor pathognomonic of any specific disorder, it may be totally disabling and if severe enough will force the patient to bed There, relief may be obtained only if all movements of body and head are avoided The milder case, while ambulatory, will state that invalidity begins unless stooping or turning movements are either completely avoided or carried out slowly

It is assumed that the seat of the trouble is the vestibular portion of the inner ear where central or peripheral stimuli cause a disturbance in equilibrium If auditory symptoms are also present, we consider it Ménière's syndrome Dizziness alone without auditory symptoms is much more often the complaint This disturbance may be part of many general diseases There are, however, many cases in which the most painstaking investigation fails to find objective evidence of any disorder The outstanding feature of all cases is that vertigo is either started or aggravated by motion This means by postural changes of body or head

This observation suggests a therapeutic approach of value in travel sickness, in which motion also produces the identical symptom complex In air sickness and sea sickness scopolamine is at this time the drug of choice [1,2] True, evaluation of treatment is difficult in a condition in which already, from a diagnostic point of view, objective findings are lacking However, while symptomatic therapy is attempted, observation and study continue toward specific diagnosis, as well as toward specific treatment whenever possible and indicated

With this in mind, 60 patients in whom dizziness was the main complaint and who had not found relief by other means or drugs, were treated with scopolamine. A preparation of scopolamine aminoxide hydrobromide was prescribed ($^1/_{125}$ grain, 1 to 2 pellets, three times a day before meals), as it is equally effective as the mother drug but not so toxic and does not induce tolerance [3] Out of this group, 57 patients stated that this drug restored their normal equilibrium and made it possible for them to continue their respective work. If dizziness recurred when the drug was stopped, readministration proved equally effective The three cases in which vertigo was not relieved proved to be psychoneurotics who required treatment in this direction

PLACENTA PREVIA A TWELVE-YEAR STUDY

MILTON J GOODFRIEND, M D , MARK DANIEL, M D , and ALEX CHARLTON, M D ,
New York City

(From the Department of Obstetrics and Gynecology of Morrisania City Hospital)

DURING the past decade, changes in technic and treatment of placenta previa at Morrisania City Hospital were introduced to improve the result to mother and child These changes are best analyzed by dividing the cases of the past twelve years into three groups designated as group A (1935 to 1938), group B (1939 to 1942), and group C (1943 to 1946), as shown in Fig 1

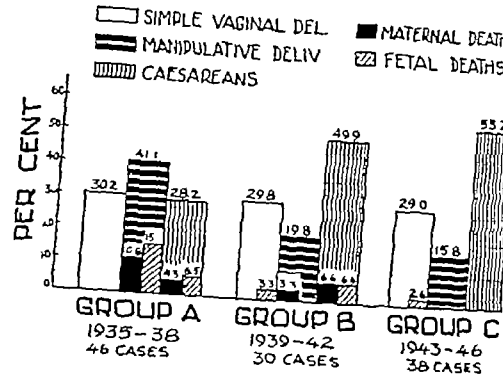

FIG 1

Material Studied

Incidence —The total number of deliveries from 1935 through 1946 was 13,684 (Table 1) Placenta previa was diagnosed 114 times, an incidence of 0 83 per cent, or one in 120 cases One patient had placenta previa twice

TABLE 1.—INCIDENCE

	Deliveries	Placenta Previa	Rate	Per Cent
Group A	5 616	46	1 122	0 82
Group B	4 416	30	1 147	0 62
Group C	3 652	38	1 96	1 04
Total period	13 684	114	1 120	0 83

age group (Tables 2 and 3) This is in keeping with the general view that placenta previa is mainly a disease of multiparae In our series, 79 9 per cent, or 91 cases, were multiparae, and 20 1 per cent, or 23 cases, were primiparae

Varieties —The determination of variety is an academic one, for what is seemingly a central placenta previa at one finger dilatation may, if labor progresses, become a *partial or marginal type* (Table 4) Similarly, a marginal or *lateral implantation* may not become palpable *until dilatation of the cervix* has progressed sufficiently Partial placenta previa

pregnancy Twenty and one-tenth per cent began to bleed before twenty-eight weeks of gestation (the earliest at twenty weeks), whereas 79 9 per cent bled during the last trimester (Table 5)

the viable babies, those born under twenty-eight week gestation are excluded, together with the fetuses dead before treatment, no matter what the period of gestation The resultant corrected fetal mortality was 21 7 per

TABLE 6.—TYPE OF BLEEDING ON ADMISSION

	Group A		Group B		Group C		Total Period	
	Per Cent	Number	Per Cent	Number	Per Cent	Number	Per Cent	Number
Initial	69 6	32	90 0	27	63 2	24	72 8	83
Repeated	30 4	14	10 0	3	36 8	14	27 2	31

Type of Bleeding.—The initial bleeding, varying from mild to profuse, caused 72 8 per cent, or 83 cases, to be hospitalized (Table 6) The remaining 27 2 per cent had repeated, small episodes of bleeding for more than one day before they were admitted It is significant that no patient died from the initial hemorrhage

Condition on Admission.—Eleven and four-tenths per cent, or 13 cases, were judged to be in poor condition on admission, as evidenced by the amount of blood loss, drop in blood pressure, rapid pulse, reduced hemoglobin, or shock

Maternal Mortality and Morbidity.—There were ten maternal deaths in the twelve-year period, an incidence of 8 8 per cent (Table 7) Most of the deaths occurred in group A, which had seven, group B had three, and there were no deaths in group C (Fig 1) These deaths and their significance will be discussed later The maternal morbidity, defined as 100 4 F for two or more days exclusive of the first twenty-four hours, was 30 4 per cent, or 14 cases, in group A, 16 6 per cent, or five cases in group B, and 17 4 per cent, or six cases, in group C

Fetal Mortality.—The gross fetal mortality for the entire series was 45 6 per cent (Table 8) In order to determine the effect of treatment on

cent, or ten cases, for group A, 10 0 per cent, or three cases, for group B, and 2 7 per cent, or one case, for group C (Fig 1)

Methods of Treatment.—The methods of treating placenta previa fell into three main categories (Fig 1, Table 9) Method I included the cases treated by rupture of the membranes and simple vaginal delivery Method II included the manipulative vaginal deliveries in which the hydrostatic bag, Braxton-Hicks or internal version and breech extractions were used, singly or in combination Method III consisted of the cases treated by cesarean section The three methods of treatment were analyzed by groups and the results totaled for the twelve-year series

Simple vaginal delivery (method I) was done in approximately 30 per cent of groups A, B, and C, respectively Manipulative delivery (method II) declined from 41 1 per cent in group A to 19 8 per cent in group B, and to 15 8 per cent in group C Cesarean section (method III) increased from 28 2 per cent in group A to 49 9 per cent in group B, and to 55 2 per cent in group C, or double that of group A This shift from manipulative vaginal deliveries to cesarean sections occurred during the same periods that resulted in a reduction of the fetal mortality from 21 7 to 2 7 per cent

Causes of Deaths.—The ten deaths of the

Corrected mortality	21 7	10	10 0	3	2 7	1	12 3	14

series are summarized as follows Group A had seven deaths, four of which resulted from manipulative vaginal delivery Three of these four had fatal hemorrhages, of which one was due to a ruptured uterus, one from severe cervical lacerations, and the remaining one resulted from intrapartum bleeding behind a hydrostatic bag The fourth patient died of peritonitis secondary to a ruptured uterus The fifth death in group A had a manipulative vaginal delivery and died of a subarachnoid hemorrhage twelve hours postpartum Although this death from subarachnoid hemorrhage cannot be attributed to the manipulative vaginal delivery, the patient did have placenta previa which must be considered a contributory cause of death The remaining two deaths in group A resulted from cesarean sections Classic sections were done in both instances and both died of peritonitis

Group B had three deaths, one of which was the result of a manipulative vaginal delivery This patient died of hemorrhage following a ruptured uterus The remaining two deaths in group B had low flap cesarean sections One died of peritonitis and the other of "obstetric shock." No chemotherapy was available during the years of groups A and B

Group C had no maternal deaths

Treatment of Placenta Previa

The essential objective in treating placenta previa is to minimize and replace blood loss and to prevent infection By avoiding any unnecessary manipulative procedure that might increase bleeding or introduce infection, the maternal morbidity and mortality is lessened Fetal mortality can be diminished by the employment of the least traumatic measures and postponing treatment, whenever feasible, until the period of viability

Central Placenta Previa.—It is generally agreed that the proper treatment of central placenta previa is cesarean section, regardless of the period of viability Seventeen of the 23 central placenta previas in this series were sectioned The only exceptions were those cases in which the cervix was fully dilated on admission, permitting a rapid extraction of the placenta and fetus Of the six cases delivered vaginally, five were multiparae, all were fully or almost fully dilated on admission, leaving no time for cesarean section Anything less than full dilation would make vaginal delivery a hazardous procedure because of the danger of increased hemorrhage and damage to the very friable cervix and lower uterine segment There were three maternal and three fetal deaths in those central placenta previas treated by section, and no maternal and one fetal death in those delivered from below Two of three maternal deaths were due to peritonitis after classic cesareans They occurred in the cases of group A when chemotherapy was not available The third patient died of obstetric shock three hours after a low flap cesarean, despite three transfusions

Low Implantations.—Fifteen out of 18 cases of low implantations were treated by early rupture of the membranes which allowed the presenting part to compress the placenta If the patient was not in labor or if labor was not active, in addition to rupturing the membranes, a medical induction of castor oil, enema, and pitocin was given As a rule, labor progressed rapidly after rupture of the membranes or following the use of pitocin Three cases, two of them primiparae, were treated by cesarean section because of bleeding deemed too profuse to be controlled by rupture of the membranes

Marginal and Partial.—These two varieties of placenta previa call for the keenest clinical judgment In the early years of this series, many such cases were treated vaginally by bagging, version, or packing the cervix and vagina The resultant maternal and fetal mortality and maternal morbidity was far from satisfactory A decision was made to do cesarean sections in these marginal and partial varieties if the patient was a nulliparae, the cervix thick and dilated less than three fingers

TABLE 9.—Methods of Treatment

Manipulative vaginal	41 1	19	19 8	6	15 8	6	27 0	31
Cesarean	28 2	13	49 9	15	55 2	21	42 9	49

Multiparae with thick, undilated, rigid cervices were also sectioned This shift in type of treatment is depicted in Table 9 and Fig 1 The manipulative deliveries dropped from 41 1 per cent in group A, to 19 8 per cent in group B, and 15 8 per cent in group C, whereas the cesarean sections increased from 28 2 per cent in group A, to 49 9 per cent in group B, and 55 2 per cent in group C

This important change in policy saved lives and justified the rise in incidence of cesarean sections The maternal mortality fell from 15.2 per cent in group A, to 10 0 per cent in group B with no deaths in group C The fetal mortality likewise improved from 21 7 per cent in group A, to 10 0 per cent in group B, and only 2 7 per cent in group C There was also a corresponding decline in maternal morbidity from 30 4 per cent in group A to 17 4 per cent in group C

There were seven maternal deaths among the partial and marginal varieties Five of these occurred in Group A and were all treated by manipulative vaginal delivery Three deaths were due to hemorrhage, one to peritonitis secondary to a ruptured uterus, and one to subarachnoid hemorrhage Of the two deaths in group B, one had a manipulative vaginal delivery resulting in a ruptured uterus and hemorrhage The other patient died of peritonitis seven days after a low flap cesarean section

Discussion

In properly evaluating the decrease in maternal mortality and morbidity, it must be cited that our blood bank was in operation during the latter eight years (groups B and C) of the series, making blood in almost unlimited quantities promptly available Chemotherapy and plasma were in use during group C, but penicillin was not available in adequate amounts except during the last year of group C

Our experience has shown, therefore, that with the exception of the low placental and marginal implantations, placenta previa is best treated by cesarean section unless the vaginal findings are such as to indicate a simple, safe delivery These vaginal findings are worth stressing a thin, soft cervix, three or more fingers dilated, with the placental edge palpable, bleeding slight, patient in active labor, and preferably a multiparae

Although manipulative vaginal deliveries are to be condemned because of their attendant trauma, Braxton-Hicks version may be a useful procedure on the rare occasion when a multipara with a small fetus and a cervix sufficiently dilated to permit the introduction of two or more fingers Extreme caution must be exercised by doing the maneuver slowly, and after a 1- or 2-pound weight is attached to the leg, the labor and delivery is allowed to proceed spontaneously Unwarranted haste results in a high incidence of severe cervical lacerations and ruptured uteri

The proper management of placenta previa starts the moment the patient is admitted to the hospital To prevent any oversight due to lack of experience, the following regime has been made compulsory

1 The interns are instructed to do no rectal or vaginal examinations on any bleeding case

2 The resident is immediately notified when a bleeding case is admitted, and he takes a careful history of the bleeding

3 The patient is typed, including the Rh factor, blood is cross matched and placed on reserve in the blood bank.

4 A member of the attending staff is notified and must see the patient He then decides whether immediate treatment is to be instituted and reports his findings to his superior

5 If the patient is bleeding actively, vaginal examination is not deferred The operating room is prepared for a cesarean section The vaginal findings then decide whether the case is to be treated vaginally or abdominally, as discussed previously

6 If the bleeding is slight or has ceased, the patient is kept in the hospital and not examined vaginally, except by speculum to exclude other pathology, until the fetus has attained viability or bleeding ensues

7 If the recurrent bleeding warrants, vaginal examination is very carefully made while an intravenous infusion is running, with blood on hand and the operating room ready There is no further procrastination after the recurrent bleeding, even if the fetus is not viable

8 Whenever vaginal delivery is decided upon, the member of the attending staff must stay with the patient until she is delivered It is worth noting that once vaginal delivery has been chosen, it has never been necessary to revert to cesarean section

The diagnosis of placenta previa in this series was made solely on the history and clinical findings X-ray diagnosis by soft tissue technic has not been satisfactory at this hospital Air or contrast media cystograms have proved of little value except where the presenting part is closely approximated to the cervix

Conclusion

1 Placenta previa should, in almost all cases, be treated in one of two ways (*a*) rupture of the membranes followed by simple vaginal delivery, or (*b*) cesarean section

2 The choice of treatment is not guided solely by the type of placenta previa but also by the amount of bleeding, the parity, age of the patient, condition of the cervix, degree of dilatation, activity of labor, fetopelvic disproportion, and viability of the fetus

3 Manipulative vaginal delivery has practically no place in the modern treatment of placenta previa

4 Temporizing in the interest of the fetus is justifiable in treating certain cases of placenta previa

5 The prime consideration in treatment is the mother, but by doing more cesarean sections the fetal salvage has also increased

6 Such adjuvants as blood, plasma, chemotherapy, and penicillin probably play as important a role in the reduction of maternal mortality as does the actual treatment

Summary

1 One hundred fourteen cases of placenta previa are reviewed over a twelve-year period, an incidence of 0 83 per cent

2 The changing trends in treatment, with almost complete elimination of manipulative vaginal deliveries, are analyzed

3 Maternal mortality was 15 2 per cent in the first four years of the series, 10 0 per cent in the second, and none in the last four years Total for the series was 8 8 per cent

4 Fetal mortality (corrected) was 21 7, 10 0, and 2 7 per cent, respectively, for the three groups Total for the series was 12 3 per cent

Grateful acknowledgment is made to Dr Abraham B. Tamis for his encouragement and criticism of this work.

PREPAYMENT MEDICAL CARE

According to a report of the Council on Medical Service of the American Medical Association on April 15, 1949, the rapid and orderly growth of voluntary prepayment medical and hospital care plans has been one of the striking and stimulating economic developments supported by American medicine during the past fifteen years. The initiating and propelling force of these plans was the medical profession acting through its local and state societies and later its national organization. This movement has attained national proportions. At the present time over 30,000,000 people are covered by Blue Cross type hospital insurance and over 10,000,000 by Blue Shield type medical care insurance This stimulus and the accumulated experience gained by these organizations have prompted many private insurance companies to enter this field, and they are making substantial contributions toward the accomplishment of our ultimate objective, namely—voluntary health insurance at a nominal cost for all the people in the United States. The total number of persons covered by all voluntary agencies is 55,000,000 for hospitalization and 37,000,000 for surgical or medical care

The American Medical Association is not engaged in the insurance business and has no intention of giving a preferential standing to any one type of voluntary plan The American Medical Association does believe, however, that it has a definite function to perform, that of evaluating any insurance plan presented to the people, thus protecting them as far as possible against unscrupulous or unsound plans. The American Medical Association further believes that the people should be free to purchase the type of health security they desire. To this end the Council on Medical Service has for the past four years critically examined various plans and has given its approval to numerous plans operating on a local or state basis. The Council has felt the need for a national organization which would act as a trade and coordinating agency for all medically sponsored plans.

We therefore recommend

1 The formation of a national coordinating agency representing all qualified voluntary prepayment plans in accordance with the proposal made to the Board of Trustees by the Council on Medical Service, February 10, 1949

2 That there shall be no official connection between the American Medical Association and the Associated Medical Care Plans. However, the American Medical Association will continue to approve or disapprove all voluntary medical care plans

3 The recognition of AMCP as a trade organization of member plans and Blue Cross as occupying a similar position for voluntary prepayment hospital care plans.

4 The recognition of the responsibility of the American Medical Association to

(A) Promote the principle of voluntary insurance by educating the people as to their need for such coverage and by obtaining full cooperation from state and county medical organizations in the local field.

(B) Inform the American people of the availability of approved plans that propose to supply on a prepayment basis security against the economic hazards of serious illness.

RADIOLOGIC STUDY OF MASTOID BONE IN INFANTS IN CONJUNCTION WITH ANATOMIC AND PATHOLOGIC INVESTIGATIONS

HENRY G KOIRANSKY, M D , IRVING K ETTMAN, M D , and EDWARD L WHITE, M D , Brooklyn, New York

(From the Cumberland Hospital)

IT HAS long been recognized that mastoiditis is a frequent complication of diseases during infancy However, the earliest age at which mastoid cells can be demonstrated roentgenologically has not been definitely established Pneumatization of the mastoid bone is inconstant and irregular and gives rise to many normal variants at different ages in different individuals of the same age and in the mastoid bones of the same individual A group of infants ranging from newborn to one year of age was investigated radiologically Anatomic and histologic studies were made where possible to corroborate the roentgenogram findings.

The mastoid process is absent at birth, or, if present, is very small Cheatle pointed out that in the infant, in addition to the tympanic antrum, there are present only a few air cells which are situated in the lateral wall of the antral cavity, and 80 per cent of mastoids are pneumatized, the remaining 20 per cent being dense or acellular [1] Wittmaack has stated that the dense type of mastoid is really a pathologic one and is due to infantile otitis media which interferes with the pneumatization of bone [2] Albrecht, however, disagrees and holds that pneumatization depends on the energy of the invading epithelium and resistance of the surrounding tissue, quite apart from the presence or absence of otitis media [3]

According to Politzer and Kernison, the mastoid antrum is the only pneumatic space that is present in the newborn and is fully developed even before a rudimentary mastoid can be demonstrated [4] The antrum lies above and posterior to the external auditory meatus and the semicircular canals It is lined by epithelium which is continuous with the mucous membrane lining the middle ear and, directly or indirectly, with the cells lining the eustachian tube The mastoid bone at birth is composed of compact, spongy, and osseous substances Minute cells of the antrum evaginate into the bone and grow progressively larger until the outer border of the mastoid is approached Full development of this process may not occur until puberty At birth the cavities are filled with a mucoid material, histologically resembling Wharton's jelly With the onset of respiration, some of this is discharged through the auditory tube, thus the tube, middle ear, and antrum become pneumatized in the order named The continuity of the mucous lining of the middle ear and eustachian tube plays an all-important part in extension of the disease processes Inflammatory reactions of the primary cavities may readily involve all pneumatized portions of the temporal bone, making mastoiditis and occasionally petrositis inexorable complications in otitis media, even in the youngest age group studied Other workers in this field have stated that the extent of pneumatization facilitates the production of mastoiditis

Material

Roentgenologic studies of the mastoid bones of infants up to one year of age were made with a view to determining the earliest age that one can visualize the pneumatization within the mastoid process The greatest difficulty encountered was to prevent movement of the patient During the exposures, this was accomplished by immobilization of the infant with an attendant holding the patient's head The Law's standard oblique lateral position was used in all cases In interpreting the films, care must be taken to distinguish the semicircular canals from the pneumatized mastoid cells, the semicircular canals being very prominent in the skull roentgenogram of the infant However, a full understanding of the anatomic relations of these structures obviates this error (Fig 1)

The first 50 cases in this series were newborn infants and infants under one month of age. In this group we were able to note the beginning of pneumatization of the mastoid bone on the roentgenogram in four cases It was noted that in these infants development was more advanced, and the body weights were greater than the others of the group The remainder of the series were one month to one year of age. Here we noted that pneumatization of the mastoid began to appear at about six months of age, and after seven months we were able to demonstrate cells in the mastoid with greater regularity Here again the physical development rather than the chronologic age was a major factor in determining pneumatization. In the few cases of infants over seven months of age where pneumatization

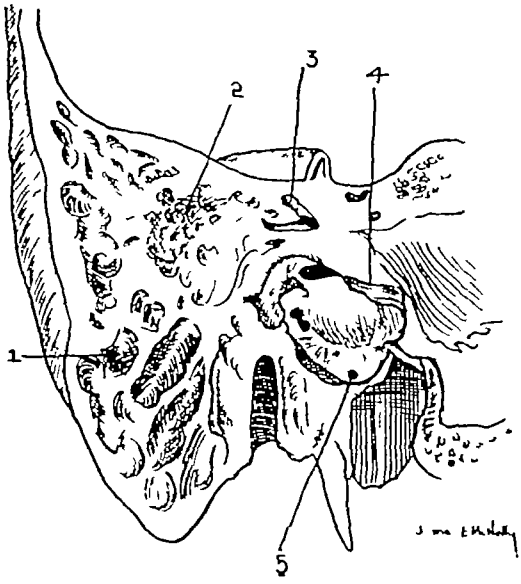

FIG 1 *1*—Mastoid cells, *2*—mastoid antrum, *3*—semicircular canals, *4*—auditory tube, *5*—tympanic cavity

could not be demonstrated, the infants were either prematures at birth or were malnourished Several of the cases had had mastoiditis at a previous admission, their mastoids were of the acellular type Unfortunately, the mastoid bones had not been x-rayed prior to their infection to establish whether the infection was responsible for the acellularity of the mastoid bone, as held by Wittmaack. The development of the mastoid cells was often found to be unequal in both mastoids in the same individual

Anatomic and histologic studies were made in eight cases In this number we were fortunate in having a 15-pound stillbirth which had been delivered by cesarean operation An x-ray of the mastoid bone was taken The mastoid bone was then bisected and decalcified, and stained sections were made It was noted on the roentgenogram that definite outpointings of the antrum extended into the mastoid bone This was corroborated on inspection of the gross anatomic specimen. Histologically, the mucous membrane lining the antrum was seen to be in direct continuity with the epithelium of these alveoli. This, according to Corning, is considered the criterion of actual beginning cell formation in the mastoid bone [5] These findings in this specimen were similar to those we see on the roentgenograms of a six-month infant of about the same weight Postmortem and roentgenologic examination of the older age groups showed physical development still to be an important factor determining the extent of cellular invasion of the mastoid bone, rather than the chronologic age.

Taylor stated that "in children under three years of age a radiograph of the mastoid will yield practically no information, because pneumatization has not taken place to any extent" [6] This view has not been held by Granger [7] We feel that since pneumatization may be demonstrated at any age during infancy, valuable information may be obtained from the roentgenograms With this in mind, a survey of 3,000 protocols of necropsies at this institution was made Acute mastoiditis as either the immediate or contributory cause of death in infants under one year of age was found in 62 cases, or in approximately 2 per cent

An interesting fact observed in this review showed that the incidence of acute mastoiditis showed a marked fall in the period following the introduction of chemotherapy and antibiotics. One can readily understand the rationale for prophylactic chemotherapy instituted by pediatricians in the treatment of upper respiratory infection in infants of this age group, knowing that cellular invasion may occur even in the newborn.

Conclusions

From the preceding observations and review of the available literature, it is our opinion that the formation of mastoid cells is dependent on physical development rather than on the chronologic age of the individual and that the mastoid bone and cells can be visualized at a much earlier age than previously considered possible. Since the presence of pneumatization may be a factor in early dissemination of infections in this region, x-ray examination can be of aid to the clinician The importance of chemotherapeutic prophylaxis in upper respiratory infection in this age group is substantiated

COMBINED RESECTION OF THE LUNG AND PARIETAL PLEURA IN THE TREATMENT OF PULMONARY SUPPURATION AND EMPYEMA

MILTON SILLS LLOYD, M D , and EMIL A NACLERIO, M D , F A C C P , New York City

(From the Staten Island Hospital and Columbus Hospital)

THE USE of new chemical and biologic agents has reduced the risk of empyema as a postoperative complication in pulmonary resection to a very low level These results are obtained notwithstanding contamination of the operative field by pathogenic organisms of varying virulence and numbers The thoracic surgeon is thus encouraged to accept the next logical challenge to his expanding field—that of the already infected pleura Resection of a lung containing a bronchus which communicates with the pleural cavity often removes the source of chronic infection, but, at the same time, it creates a new hazard by exposing unprotected areas and eliminating the advantageous mechanism of encapsulation. The rational ideal would be to remove both infected lung and infected pleura at the same time, provided there is a reasonable prospect of escaping infection of residual dead space

The limitations of this procedure would appear to be determined, for the greater part, by the amount of extrapleural dissection possible and necessary for its execution In the resection treatment of pulmonary tuberculosis, particularly following the failure of pneumothorax, thoracoplasty, or both, the extrapleural route is the only feasible one in most cases Loss of blood always occurs, mostly from the diaphragmatic surface Enough experience has been gained, however, to demonstrate that, with adequate replacement by transfusion and the use of suitable hemostatic methods and substances, the entire parietal pleura may be safely excised Cannulation of a vein in both legs is recommended as an extra precaution in the transfusion setup

It would, therefore, appear necessary only to carry this operative technic over to the treatment of combined pleuropulmonary tuberculosis to discover its widest and most effective application Additional encouragement is offered by the good results obtained with the use of streptomycin as an adjunct to the treatment of tuberculosis empyemata and chest wall sinuses

The authors wish to report two cases where this type of operation was successfully used. The first was an encapsulated empyema with bronchopleural fistula complicating a generalized suppurative bronchopneumonia of the right lung The encapsulation was limited to the lower half of the posterior costal gutter, and only a local extrapleural dissection was necessary The second case was one of extensive pulmonary tuberculosis of the left lung complicated by mixed infection empyema, bronchopleural fistula, and empyema necessitatis at the level of the second rib anteriorly Due to this second complication, it was necessary to do a preliminary resection of the eleventh rib for drainage The chest wall abscess emptied into the pleural cavity but a sinus persisted and air could be palpated under the pectoral muscles At the end of seven weeks, final consideration was given to the patient in consultation with Dr E H Robitzek of Sea View Hospital, where the same problem was under consideration at the same time [1 2] Immediate operation was decided upon. The authors believe that the records presented below represent the first reported case in which extrapleural resection was used for the eradication of a nontuberculous empyema and the first reported case in which this method was used for the treatment of a tuberculous empyema complicated by empyema necessitatis The importance of these details will become apparent with the development of the case presentations

Case Reports

Case 1—V M , a white man, age sixty-two, was admitted March 8, 1947 He had a history of pneumonia two years prior to admission, followed by chronic cough and a recurrence of pneumonia two months previously Since that time, cough was present, productive of eight to ten ounces of sputum daily Other factors related to the history were not important On physical examination, he gave the appearance of being chronically ill and coughed frequently The positive physical findings were enlarged lymph nodules in the anterior triangles on both sides of the neck, dullness over the base of the right posterior lung with numerous loud rales and ronchi, an occasional ronchus also being heard in the left base posteriorly X-ray of the chest demonstrated a shading over the lower half of the right lung which had persisted after the pneumonia (Fig 1) There was also a density, extending downward from the right hilus along the mediastinum, which had a rounded upper border about 2 inches wide and fused with the shadow over the lower lung field Urinalysis was normal Blood picture was as follows red blood cells 4 800,000, hemoglobin, 86 per cent, white blood cells 16,600, polymorphonuclears 34 per cent, lymphocytes 64 bands 6 per cent, and eosinophils 2 per cent

Bronchoscopy, performed on March 8, 1947 showed intense inflammatory and edematous in-

FIG 1 Posteroanterior view of chest (Case 1) Note accentuated markings on the right side and roughly oblong density lying against the right cardiac border

FIG 2 Appearance of the chest twelve days after pneumonectomy (Case 1)

filtration of the bronchial mucosa, particularly on the right side, with large amounts of drainage from the lower and middle lobes Lipiodol injection on March 15 demonstrated no bronchiectasis Bronchoscopy was repeated several times without improvement On March 29, a spread of the bronchial inflammation to the upper lobe was noted A biopsy was made which showed bronchial mucosa and submucous glands, with no evidence of malignancy It was decided that pneumonectomy provided the patient's only chance. Operation was carried out on April 14, as follows

With the patient in the face-down position, the usual curved incision was made Short segments of the fifth and seventh ribs posterior to the angle were resected, and the sixth rib was resected completely subperiosteally, the pleura was opened in the bed of the sixth rib, and extensive adhesions over all of the lobes were encountered These were separated by sharp and blunt dissection, and the short and long fissures were exposed On palpation, the middle lobe and the lower part of the upper lobe were found to be nodular and firm, as well as the lower lobe When the division of the adhesions over the pleura had been carried to the posterior costal gutter, a firm plaque on the chest wall was encountered. This was apparently thickened pleura The lower border of this plaque was separated from the pulmonary surface, and grayish pus exuded The opening was increased in size, and the walls were found to be partially ossified This was apparently an old encapsulated empyema, and it was deemed advisable to remove this with the lung The pocket was packed with plain gauze. The dissection was carried to the extrapleural plane, and the empyema sac, including its encapsulation, was separated from the inside of the chest wall until the true pleural cavity was entered on the medial side by the end of the dissecting finger Adhesions over the diaphragm were found to be very dense and bled considerably It was, therefore, decided to begin the dissection of the root and ligate the vessels to control bleeding A number of large inflammatory glands, some of them the size of a hen's egg, were found in this area, and the exposure of the independent structures was difficult The main bronchus was freed and ligated, then amputated, using a short piece of tubing on the posterior wall for imbrication The pulmonary artery was then exposed with considerable difficulty It was ligated in the usual manner, using anchor suture The pulmonary veins were similarly treated The diaphragmatic adhesions were separated by blunt dissection, and the lung was removed The bronchus was closed by a layer of mattress sutures and a layer of end sutures, the latter including a flap of pleura from the mediastinum. The chest was closed in layers without drainage Black silk was used throughout One hundred thousand units of penicillin were instilled into the pleural cavity and 450 cc of air were withdrawn, leaving an end pressure of −12cm water

In the postoperative care, 100,000 units of penicillin were injected into the pleural cavity following aspiration of air and blood on the first two postoperative days, April 15 and 16 A similar amount of penicillin was injected without aspiration on April 20, 22, and 30 and May 11 At the time of the last instillation of penicillin, a specimen of

FIG 3 Posteroanterior view of chest (Case 2) showing complete obliteration of the left hemithorax with fluid level at the first anterior rib

clear, brownish-red fluid was removed and submitted for culture It proved to be sterile In addition, the patient required a bronchoscopy thirty hours postoperatively and digitalization of the heart for a sudden fibrillation which occurred on the fourth postoperative day He was discharged on May 16 in good condition and has remained so up to the present time Figure 2 shows the postoperative appearance of the chest on April 26, 1947

Case 2 —A. M , a white woman, a widow age thirty-eight, was admitted to the hospital on June 27, 1947, complaining of cough and expectoration of large amounts of mucopurulent material. The immediate complaints began about six months previously, with pain in the left chest and loss of weight and strength About one month later, she began to cough and expectorate yellow mucus The cough became worse, and about two weeks before admission she began to expectorate what she thought was "pus" About the same time, she experienced a moderate degree of dyspnea

She stated that fifteen years ago, she was in a "run-down condition" and was told that she had a "spot on her lung" She took "several months' rest" and had been symptom-free until the beginning of the present illness

On physical examination, there was dullness and decreased breath sounds over the entire left chest with an absence of fremitus at the base. The left breast and the chest wall above it were swollen and tender, and there was crepitus and pain on pressure over this area The right lung was clear Heart was normal, blood pressure 112/78 Other physical findings were without significance

An x-ray of the chest showed shifting of the trachea and mediastinum to the left and complete opacity of the left hemithorax with a fluid level in the apex at the level of the first anterior rib (Fig 3) On the right side, there was scarring and calcific deposits

Laboratory findings were as follows Urinalysis, normal, red blood cells 2,680,000, hemoglobin 46 per cent, color index 0 9, white blood cells 18,100, polymorphonuclears 79 per cent, and lymphocytes 21 per cent. Sputum examination showed numerous tubercle bacilli The diagnosis was pulmonary tuberculosis, mixed infection empyema, bronchopleural fistula, and empyema necessitatis on the left side with secondary anemia

Course and Progress —The temperature following admission varied from 103 5 to 101 F The sputum amounted to six to eight ounces daily Culture from the left pleural cavity yielded nonhemolytic streptococcus It was decided, on account of the chest wall abscess, that drainage of the pleural cavity was essential, whatever therapy might be undertaken at a later date Consequently, the patient was prepared for operation by adequate transfusion and the eleventh rib left was resected under local anesthesia on July 8, 1947 The temperature leveled off at normal within two weeks The cough disappeared, and the general clinical condition improved A residuum of the chest wall abscess remained, however, and crepitus could be made out under the palpating finger

On August 26, the patient was considered in good enough condition to undergo a pleuropneumonectomy The following is a description of the operation taken from the hospital records

The patient was prepared preoperatively by local and paravertebral block anesthesia, using a 0 4 per cent novocaine solution In the face-down position, the usual curved incision was made, and the sixth rib was resected subperiosteally The line of cleavage was picked up in the endothoracic fascial plane and was followed in both directions, with difficulty, however, due to the rigidity and thickness of the pleura. In order to obtain sufficient exposure, it was necessary to resect the seventh rib also Dissection was carried out, for the most part, by sharp technic Fusion with other membranes, such as the diaphragmatic pleura and pericardium, was so dense that no line of cleavage could be found. A large segment of pericardium was removed, together with the pleura, exposing the heart on the left side Over the diaphragm, the adhesions were of such multiplicity and so well organized that an opening was made into the abdominal cavity at one point. This was repaired by interrupted sutures of black silk. There was also a relatively great loss of blood over the diaphragmatic surface, and the pleural cavity was entered on several occasions The hilar structures were also exposed with difficulty, but it was possible to treat each anatomic structure individually, the vessels by double ligature and anchor suture and the bronchus by one row of mattress sutures, one row of end sutures, and a fascial flap from the mediastinum. Oozing from the surfaces was controlled by strips of Gelfoam The chest wall abscess communicated with the pleural cavity between the second and third ribs The sinus contained pus and caseous material, which was cleaned out by gauze wipes and curet. The

chest wall was closed in layers, using a chromic catgut number 3 pericostally and interrupted black silk for the muscle fascia and skin The drainage wound at the eleventh rib was excised and the opening packed with gauze The patient left the operating room in good condition, having received 3,000 cc of citrated blood and 2,000 cc of glucose and saline by transfusion Anesthesia, administered by Dr M Swick, was intratracheal (intubation under 30 minims 10 per cent cocaine solution) gas-oxygen and ether

The patient had received 2 Gm. daily of streptomycin beginning on August 14 1947, divided into doses of 250 mg every three hours This was continued postoperatively with the addition of 25,000 units of penicillin The combined dosage of streptomycin-penicillin was maintained until September 15, 1947, when the penicillin was discontinued and the streptomycin cut to 1 Gm daily in four doses which was continued to September 22, 1947 The patient's postoperative course was sufficiently favorable to permit an anterior and posterior thoracoplasty for the removal of the second, third, fourth, and fifth ribs on September 5 and September 12, 1947 The three operations were carried out within a total of seventeen days, and primary union was obtained in both thoracoplasty wounds The patient was discharged on October 16, 1947, in good physical condition, with normal temperature and no cough but with a persistent sinus at the level of the eleventh rib This was thought to be due to residual infection from the chest wall abscess, but it was considered worth while to see whether it would not close spontaneously, given sufficient time Total dosage of streptomycin was 71 Gm.

Second Admission —During five weeks' observation, gradual rise of the diaphragm obstructed drainage The patient was readmitted on November 19, 1947 On November 20, the eighth rib was removed and a drainage opening established above the dome of the diaphragm. On December 15, the anterior thoracoplasty wound was reopened The sinus tract was picked up and followed for a distance of about 1½ inches into the neck below the first rib and the subclavian artery After removal of the anterior part of the first rib and the costal cartilage, the sinus was cleaned by curettage, and the wound was packed with ½-inch gauze.

On December 21, 1947, the patient was placed on streptomycin, 2 Gm. daily, in divided doses every three hours This was continued until January 20, 1948 The apical sinus was completely closed by January 17, 1948, and did not reopen On January 20, streptomycin was reduced to 1 Gm daily in divided doses (every three hours) and continued to January 30, 1948 The patient was discharged on February 7, 1948, with a persistent tract between the upper and lower thoracoplasty wounds Total dosage of streptomycin administered during this admission was 50 Gm

Third Admission —Although the patient continued to gain weight and remain otherwise symptom-free, the pleural dead space failed to close, and the patient was readmitted to the hospital for a muscle flap closure on April 9, 1948 On April 10, the ninth and tenth ribs were removed subperiosteally, taking care to conserve the blood supply of the intercostal muscle A sufficient length of this muscle was freed to fill the pleural dead space and was drawn into the tract from below The transplant "took," but at the end of one week the ligamentous portions showed signs of liquefaction at the distal end The patient was discharged on May 8, 1948, at which time the lower wound was completely healed, but serous drainage from the upper wound was still present During this admission, no streptomycin was given The wound was kept clean by dusting in penicillin and sulfathiazole powder An x-ray of the chest taken on July 30, 1948, shows the residual sinus filled with lipiodol (Fig 4)

Fig 4 Posteroanterior view of chest (Case 2) eleven months after pleuropneumonectomy, showing the results of complete thoracoplasty on the left. Patient was clinically well at time of this examination.

The wound is now completely healed and the patient symptom-free *

Summary and Conclusions

Two cases are reported in which combined resection of the lung and parietal pleura was successfully used for the treatment of pleuropulmonary disease with fistulous communication.

Further experience is necessary before final judgment can be given, but the method is recommended, particularly when the disease is of tuberculous origin

In Case 2, the outcome of the operation was fouled by residual infection from a chest wall abscess This single experience suggests that in the absence of this complication resection should be done without drainage of the pleura

When it is present, drainage is necessary, and the abscess should be cleaned up as a part of the preoperative preparation

The experience also indicates that, if muscle transplant is necessary, a long strip of intercostal muscle is less suitable for the process than other skeletal muscle due to the presence of a relatively large portion of ligamentous fibrous elements

* Authors note Since this paper was sumitted for publication a sinus has reopened in case 2 below the left clavicle over the site of the previous tuberculous abscess of the chest wall and tubercle bacilli have been recovered from scrapings. The patient however is still able to perform her normal duties

COMPLICATIONS OF PERITONEAL BUTTON OPERATION FOR ASCITES

Murry Goldfischer, M D , Adrian Kantrowitz, M D , Stanley Kornblum, M D , and Arthur H Glick, M D , F A C S , New York City

(From the Surgical Service of Montefiore Hospital)

THE problem of ascites secondary to portal hypertension has vexed the medical profession for many years Many surgical approaches have been devised since the last of the nineteenth century in an attempt to relieve the ascitic patient

Drummond and Morison reported the first surgical attempt in 1896 [1] Talma in 1898 reported on his operation, now known as the Talma-Morison omentopexy [2] Repeated follow-up studies of this procedure have shown it to have a high operative mortality without improving the prognosis

Ferguson reported a case in which a right nephrectomy was done and the renal pelvis was anastomosed to the peritoneum [3] This provided an outlet for the ascitic fluid via the bladder However, while obviating repeated paracentesis, this method did not prevent the loss of proteins, fluid, and electrolytes

Whipple devised the shunting operation, lienorenal anastomosis, in an effort to overcome the portal hypertension [4] Blakemore and Lord similarly devised the portacaval anastomosis [5] The results of both of these procedures are too recent to be evaluated The main objection to them, in our minds, is that they are major operative procedures on poor risk patients

Recently the peritoneal button operation, a relatively innocuous procedure for surgical correction of ascites, has come into vogue The origin of this procedure is obscure However, Lichtman states that Boccaro in 1922 was surgically inserting a peritoneal button to drain the ascitic fluid into the subcutaneous tissues [6] Tannahill in 1930 reported one case [7] Crosby and Cooney in 1946 reported six cases [8]

The rationale underlying this procedure is the creation of a permanent fistulous connection between the peritoneal cavity and the subcutaneous tissues of the anterior abdominal wall by means of a button The button allows the ascitic fluid to pass to the subcutaneous tissues from whence it is absorbed Theoretically this procedure answers the major objections to the previously described surgical maneuvers, namely it is simple and rapidly performed, and it prevents the loss of protein, fluids, and electrolytes from the ascitic fluid by returning them to the general circulation

Crosby and Cooney's report of their modification of this simple operative procedure for the relief of ascites has caused an increased interest in the peritoneal button operation Welch has reported on one of the causes of failure of this procedure [9] He found that the subcutaneous pocket developed a firm fibrous wall lined by mesothelium Welch concluded that, because of the small area of surface exposed and the fibrous character of the wall, little absorption could take place from such a cavity

It is the purpose of this paper to present another complication of the peritoneal button operation. A survey of the literature since

Crosby and Cooney's article has failed to reveal any reports of intestinal obstruction secondary to herniation and incarceration of bowel into the subcutaneous cystic space

Case Report

N M, a fifty-year-old Puerto Rican woman, was admitted to the surgical service complaining of painless abdominal swelling for the past eight months

Present history began in 1936 with an uneventful cholecystectomy for cholecystitis and cholelithiasis From 1936 to 1947 patient had three hospital admissions for biliary tract disease, including one for a common duct exploration, the results of which were negative In 1946 a diagnosis of biliary cirrhosis was established, but no ascites were noted One year later, the sudden onset of ascites was noted A diagnosis of portal vein thrombosis was made The patient had several further hospitalizations for study and paracentesis In October, 1947, a peritoneal button was inserted in the right lower quadrant in an attempt to relieve her ascites She was admitted to Montefiore Hospital for further observation on November 14, 1947

Pertinent physical findings on admission were a muddy bronze color of the skin, blood pressure 130/70, a tremendously distended abdomen showing numerous operative scars, and a large hernia-like mass in the right lower quadrant about 7 inches in diameter, cystic to palpation, collapsible by pressure, and filling in waves when released A fluid wave and shifting dullness were present No abdominal organs or masses were palpable because of the ascites.

Aspiration of the right lower quadrant mass revealed straw-colored ascitic fluid, and it was felt that this was a nonvascular, nonabsorbing hyalinized pouch connecting with the peritoneal cavity through the patent button

Results from the laboratory examinations were as follows urine negative except for a trace of albumin, hemoglobin 82 per cent, 3,960,000 red blood cells, urea nitrogen 9 mg per cent, cephalin flocculation 4 plus, thymol turbidity 7 units The total protein was 4 4 mg per cent, albumin 2 mg per cent, and globulin 2 4 mg per cent

The patient had several paracenteses done for relief of ascites On December 12, 1947, another peritoneal button was inserted in the left lower quadrant through a 3-inch incision, and the right lower quadrant subcutaneous pouch was unroofed and biopsied. Histologic examinations of the wall showed fibrosis with chronic inflammation and was lined with mesothelium as described by Welch (Fig 1) Following this, the right lower quadrant pouch again filled and ascites reaccumulated. It was felt that because of the low plasma protein she might not be absorbing fluid from her subcutaneous tissues Accordingly, the patient was given four times concentrated human plasma equivalent to 5,500 cc. of plasma over an eighteen-day period, plus salt restriction and a high protein, high caloric diet. She was also given vitamin supplements and mercurials Her total proteins rose to 6.2 mg per cent, albumin 3 1 mg per cent, and globulin 3 1 mg per cent, and the ascites remained stationary

FIG 1 Section of wall through subcutaneous pouch showing mesothelial lining, fibrosis, and chronic inflammation Biopsy taken two months after insertion of button and formation of nonfunctioning subcutaneous pouch (93×)

On January 19, 1948, a paracentesis was performed On January 20, the patient began to complain of abdominal pain, nausea, vomiting, and obstipation Her temperature rose to 101 F, and her abdomen became markedly distended Physical examination on January 21 revealed a markedly distended abdomen with generalized tenderness and rebound. The right lower quadrant pouch could not be reduced as heretofore No audible peristalsis was heard on auscultation. Complete blood count and urinalysis were not significantly abnormal A flat plate of the abdomen showed markedly dilated loops of small bowel but no fluid levels This was interpreted as a paralytic ileus The right lower quadrant pouch was tapped and several cubic centimeters of fluid removed for smear and culture. A diagnosis of peritonitis secondary to paracentesis was made Patient was given penicillin and streptomycin, and a Miller-Abbot tube was passed Three days after onset, the right lower quadrant pouch was again tapped, this time until no further fluid (1,200 cc) could be obtained Following this procedure, a mass could

be felt in the subcutaneous pouch suggesting coils of bowel

By this time the patient had become comatose and was explored without anesthesia A loop of bowel was found to have herniated through the peritoneal opening in the right lower quadrant displacing the Cooney button, which was lying free in the subcutaneous pouch The bowel, which was still viable, was replaced and the hernia repaired, obliterating the space. Another Cooney button was inserted in the left lower quadrant via a stab wound incision.

Following surgery, the patient gradually improved on supportive therapy, regaining consciousness on the fourth postoperative day She was ambulated without further event

Discussion

The failure of the peritoneal button to function in this case has been fully in accord with Welch's observation The wall of the subcutaneous pouch became fibrotic and lined with mesothelium Biopsy of the pouch and histologic sections of the wall showed this to be the case

The fact that this case of intestinal obstruction was missed for three days can only be ascribed to our failure to drain the subcutaneous pouch of ascitic fluid completely on the day that the patient began to complain The x-ray picture of intestinal distension, plus the lack of any audible peristalsis, led us to believe that we were dealing with a paralytic ileus on an infectious basis following paracentesis There is no doubt that the reaccumulation of fluid caused tension on the anterior abdominal wall This tension coupled with a persistent hypoproteinemia was sufficient to cause disruption of the abdominal wound with herniation of the Cooney button into the subcutaneous pouch, along with loops of bowel.

We have had two other cases of cirrhosis with ascites in which peritoneal buttons have been inserted via stab wound incisions Neither of these cases has developed subcutaneous pouches in a six-month follow-up, and both have been definitely benefited We feel that subcutaneous pouch formation may be avoided by use of a stab wound incision so that tissue planes are not opened up to permit formation of a pouch

Despite the failures that have been reported to date we feel that a further trial of this procedure is warranted

Summary

1 A review of surgical procedures for the relief of ascites secondary to portal hypertension has been presented

2 One reason for failure of the peritoneal button operation to work is the formation of a fibrous-walled, mesothelial-lined subcutaneous pouch from which absorption is minimal

3 A hitherto unreported complication of the peritoneal button procedure is presented This is subcutaneous wound disruption with the button and loops of bowel becoming incarcerated in the subcutaneous pouch The case history of this complication is presented

4. It is suggested that the use of a stab wound incision for the insertion of the peritoneal button may lower the incidence of subcutaneous pouch formation

LEADERS TELL YOUNG DOCTORS THRILL OF COUNTRY PRACTICE

A unique effort to turn young doctors of 1949 from the big city to the small town was planned by the Illinois State Medical Society Seventy-five young interns and residents, just about ready to hang out their shingles, were invited to the Hotel LaSalle, Chicago, as dinner guests of the Society on April 26, to hear the story of the small town's advantages. Three veteran small town doctors explained to them how to set up an office, to handle patients in home and office visits, and to meet other problems of practice A young doctor who recently set up practice in a country town told of his problems and how he solved them with the help of the neighbors. A small town banker told them how to find and finance their equipment, offices, homes, and cars A description of 40 Illinois rural areas which are in need of additional physicians was given them, with the names and addresses of key persons to whom they might turn for information, advice, and help A second list of 30 Illinois country doctors who want to retire soon and are looking for youngsters to take their places was also provided.

The Illinois State Medical Society, among other efforts to increase the number of physicians in rural areas, a year ago established a $100,000 joint student loan fund in collaboration with the Illinois Agricultural Association. Funds are loaned from it to students to pay for their medical education

HABITUS IN TUBERCULOSIS

JOSEPH W GOLDZIEHER, M D , SYDNEY BASSIN, M D , F C C P , and SARA T GOLDZIEHER, M A , New York City

(From the Department of Medicine, Municipal Sanatorium of the New York City Department of Hospitals, Otisville)

BELIEF in the existence of a "TB type" (habitus phthisicus) is firmly entrenched in the minds of laymen and over the years has gained wide tacit acceptance in the medical profession generally In sharp contrast is the consensus of opinion among phthisiologists, who deny the existence of any such constitutional type At a time when intensive campaigns to control tuberculosis by mass survey and to educate the public are being waged, such beliefs assume importance, for they affect the reactions of the laity and the index of suspicion among physicians

Descriptions of the so-called habitus phthisicus (vertical, "hyposthenic" body build, small globular heart, etc) show a very close resemblance to, and are probably identical with, those of individuals said to have "constitutionally" poor adrenal cortical reserve, a condition sometimes designated as chronic benign hypoadrenia [1] In addition to the hyposthenic habitus and globular heart, mild hypotension, lymphocytosis, and biochemical changes characteristic of poor adrenal function are observed If the "habitus phthisicus" were identical with a constitutionally poor adrenocortical reserve resulting in lowered resistance and immunity, then it would indeed acquire a sound theoretic foundation as well as clinical significance It was our purpose in this study to investigate the frequency of the stigmata of "habitus phthisicus" and to determine whether or not patients with these stigmata were in any way different from other tuberculous patients, with particular reference to blood pressure and lymphocyte picture

Materials and Methods

The records of 250 patients were selected at random from the files of the Municipal Sanatorium of the New York City Department of Hospitals, excluding only those who had an acquired distortion of the thoracic cage (i e , thoracoplasty) Sixty-one and one-half per cent of the patients were men, 38 5 per cent were women Seventy-eight per cent were of the white race, 20 2 per cent were Negroes, 1 2 per cent were Chinese, and 0 6 per cent were Indians The age distribution was as follows 10 to 19 years—22 2 per cent, 20 to 29 years—36 7 per cent, 30 to 39 years—27 0 per cent, 40 to 49 years—10 9 per cent, and 50 to 59 years—3 2 per cent The patients of the Sanatorium are particularly suitable for this problem, for they are almost all early cases of tuberculosis in which cachexia (and cardiac atrophy) is less apt to confuse the observations The admission blood pressure, white blood cell count, lymphocyte percentage, and posteroanterior chest film in deep inspiration were used for study The cardiothoracic ratio was measured, and the cardiac shadow was evaluated as to size (small or not) and shape (vertical or not) Lastly, the chest film was studied for the presence of extrinsic factors which could cause mediastinal distortion, such as retraction of the hila, congenital thoracic deformities (e g , pes cavus), emphysema, pressure due to pneumothorax or effusion, etc The pulmonary disease process was studied to determine whether or not the character and severity of the disease could account for atrophy and decrease in cardiac size It was then possible to judge whether or not these extrinsic factors could account wholly, partially, or not at all for alterations in the cardiac contour

Results

Cardiothoracic Ratio —The cardiothoracic ratios are plotted as a frequency distribution curve in Fig 1 Although it was impossible to obtain a nontuberculous sample of the same

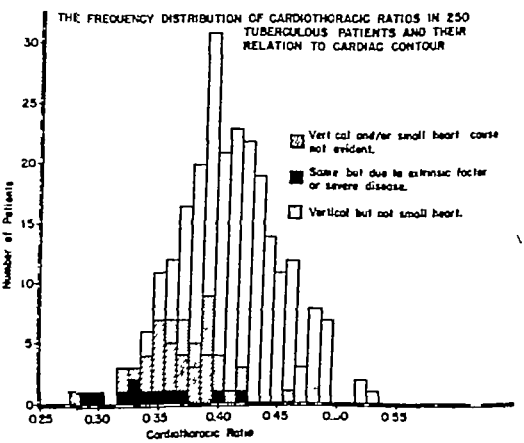

FIG 1

population for comparison, the shape of the curve itself is quite significant It will be observed that the shape resembles very closely the Gaussian curve of a random distribution, certainly there is no disproportionate number of patients with small cardiothoracic ratios In fact, the curve shows a preponderance of cardiothoracic ratios greater than the mean of the group It may be concluded, therefore, that there was no unexpectedly large proportion of patients with small hearts (by measurement) or hyposthenic habitus, as indicated by the cardiothoracic ratio

Cardiac Contour —Three cases (1 2 per cent) were observed in which the heart appeared small but not vertical Eighteen cases (7.2 per cent) showed a heart which was vertical, but not small Thirty-two cases (12 8 per cent) showed a heart which was both small and vertical

No extrinsic factors were observed which could account for purely small hearts

In purely vertical hearts, extrinsic factors accounted completely for the cardiac changes in 13 cases, and partially in one case, leaving only four cases of the 13 in which the heart was vertical for no evident reason It would appear that the cardiac abnormalities in this group are largely a matter of distortion, and cannot be ascribed to "constitutional" factors

Of the 32 hearts which appeared both small and vertical, only 17 were free of any pulmonary factor which could account for the changes In five instances, the character and severity of tuberculosis were apparently sufficient to explain the microcardia observed, other extrinsic factors were completely responsible for the cardiac changes in six cases and partially responsible in four cases

Thus, thoracic pathology accounted wholly for the "constitutional" microcardia in 65 per cent of the entire "abnormal" group and played at least a partial role in an additional 30 per cent From these figures it becomes increasingly apparent that "constitutional" (i e , unexplained) microcardia is of relatively minor significance

Figure 1 also illustrates the relationship of cardiothoracic ratio to changes in cardiac contour It is evident that a small heart and a low cardiothoracic ratio are not equivalent It was for this reason that statistical comparisons were based on groups differing in cardiac contour rather than on groups representing any selected range of CT ratios On the former basis, significant differences between the groups were far more likely to appear with statistical treatment of the data

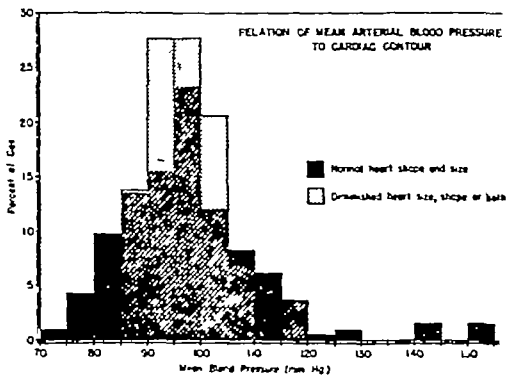

FIG 2.

Blood Pressure —For the purposes of mathematical simplicity, the mean blood pressure (average of the systolic and diastolic pressures) was used While this abbreviation is not always permissible (e g , in the study of hypertensive states), there seems to be no objection to the method when hypotension is the factor under consideration Figure 2 illustrates the mean arterial pressures of the two groups those with normal cardiac contour and those with vertical and/or small hearts not due to manifest extrinsic factors The mean blood pressures are almost identical, and there is no statistically significant difference between the two groups, the observed differences in the curves are well within the limits of variation due to sampling Evidently, then, this second criterion also fails to show the presence of a constitutionally stigmatized group

Lymphocytes —Studies of both the relative (i e , percentage) and the absolute counts were carried out, because it has been shown that the two methods do not always yield identical results [2] The data obtained are presented in Table 1

TABLE I —RESULTS OF RELATIVE AND ABSOLUTE LYMPHOCYTE COUNTS

	Lymphocyte Percentage		Lymphocyte Count (in thousands)	
	Mean	Standard Error	Mean	Standard Error
Control group (normal cardiac contour)	29 1	9 6	2 41	0 82
Vertical and/or small hearts*	33 9	12 35	2 62	1 02
All small hearts*	34 6	12 6	2 58	1 02

* Excluding those due to intrathoracic pathology

Comparison of the control group with each of the other two groups by the determination of "T" yielded values (both for percentage and absolute counts) which were less than 0 2 in

every case * This is an entirely insignificant figure, for a value of T = 2 5 (representing odds of 80 1 against chance occurrence) is usually accepted as the minimum for statistical significance It appears that there is actually no difference in the lymphocyte picture of the two groups, even though mere inspection of the percentage suggests what is often described as a "tendency" in the literature Statistical analysis, however, shows that this "tendency" is due to the variability of the samples and does not represent any real difference One must conclude, therefore, that even this third criterion speaks against any constitutional differences between the two groups

Discussion

As long as those who believe in a constitutional type of tuberculous patient continue to have relatively vague and indefinite criteria which are unsuitable for statistical or even objective evaluation, it will remain impossible to arrive at a definitive answer We have been forced to select as criteria for our study those features which are mentioned most often, which have the greatest potential significance, and which are amenable to mathematical analysis It is always possible that a selection of different criteria might yield other results

The data presented above indicate strongly that there is no discernible "TB type" in the population we have studied It must be emphasized that this does *not* imply the absence of individuals with an increased susceptibility to tuberculous infection There is ample clinical and experimental evidence to show that such a state can and does exist and can even be produced experimentally, e g , by adrenalectomy [3] What these data do show is that a "constitutionally" susceptible type of patient, far from being an outstanding feature, forms an insignificant and statistically undetectable percentage of the patients seen in a sanatorium for early tuberculosis

It seems that the concept of a "habitus phthisicus" was formed by the impressionistic methods of earlier clinicians and pathologists who saw a relatively large proportion of far-advanced or terminal cases and mistook their uniformly cachectic appearance for a constitutional stigma

In certain large groups of the population which are subjected to mass x-ray survey, the index of suspicion of the individual physician plays no part in case finding There are, however, other large groups in which x-ray examination of the chest is undertaken only when some particular observation arouses the suspicion of the examiner All too often, such a suspicion is allayed by traditional concepts of the habitus of a so-called TB type, with the result that a "silent" lesion in an apparently robust patient may go undetected It is, therefore, vitally important to emphasize the insignificance of habitus in tuberculosis

Summary

1 The blood pressure, lymphocyte percentage, lymphocyte count, and chest films of 250 tuberculous patients, selected at random, were studied for objective evidence of a "habitus phthisicus "

2 No distinctive habitus was apparent from study of the chest films and cardiothoracic ratio

3 In 53 cases, the heart appeared small, vertical, or both In 29 (55 per cent) of these, intrathoracic factors accounted (partially or entirely) for the cardiac changes Comparison of the remaining 24 patients with the group showing normal hearts failed to reveal any statistically significant difference as to blood pressure, lymphocyte count, or lymphocyte percentage

4 These studies indicate a noteworthy absence of any particular "constitutional type" among tuberculous patients

5 The danger of suspecting tuberculosis only in those patients who are of the so-called TB type is emphasized

We wish to acknowledge our indebtedness to Dr Samuel Topperman, whose unstinting cooperation made this study possible

RELATIVE VALUE OF THE STANDARD AND UNIPOLAR LEADS IN THE DIAGNOSIS OF MYOCARDIAL DAMAGE

SEYMOUR H RINZLER, M D , New York City

(From the Cardiovascular Research Unit, Beth Israel Hospital)

THE routine electrocardiogram in our cardiac clinic consists of standard limb leads I, II, and III and precordial leads CF_1 and CF_4 Whenever needed, precordial leads CF_1 through CF_6 are taken. It has been our impression that this had proved an adequate system for the diagnosis of myocardial damage

Recently, however, unipolar lead electrocardiography has been promulgated as a system of electrocardiographic interpretation which should substitute for the present bipolar system It has been stated, "If unipolar limb leads and multiple precordial leads are available, standard leads are superfluous since they contribute no information that cannot be derived more precisely from the unipolar limb leads, studied in conjunction with multiple precordial leads "[1] Experience with the bipolar system has accumulated for more than thirty years, and definite patterns of abnormality in the electrocardiogram have become well known to many physicians, whether specialists in this field or no

It seemed reasonable, therefore, that before subjecting all physicians to the task of learning unipolar lead electrocardiography that the usefulness of the standard leads in diagnosing myocardial changes be compared with that of the unipolar leads

Method

Eighty-five patients were selected at random from the active attendance at the cardiac clinic Standard limb leads I, II, and III, precordial leads CF_1 and CF_4, unipolar extremity leads aVr, aVl, and aVf, and unipolar precordial leads V_1 through V_6 were taken on each patient

In the analysis of the data, leads I, II, III, CF_1, and CF_4 were examined separately from the unipolar extremity leads aVr, aVl, aVf with precordial leads V_1 and V_4 and analyzed according to presence or absence of myocardial damage Further, the unipolar precordial leads V_1 through V_6 were compared with unipolar precordial leads V_1 and V_4 with respect to the possible additional information that might be obtained by taking the four extra precordial leads

The cardiac diagnoses on these 85 patients were as follows arteriosclerosis, 37, hypertension, three, arteriosclerosis and hypertension, 24, rheumatism, 14, rheumatism and hypertension, one, syphilis, one, arteriosclerosis and syphilis, one, congenital, one, possible heart disease, two, and unknown, one

Results

When standard leads I, II, III, CF_1, and CF_4 are examined, 36 of the 85 electrocardiograms (42 per cent) are abnormal This method of examination we shall call method A. When unipolar limb leads aVr, aVl, and aVf with V_1 and V_4 are examined, 39 of the 85 cases, or 46 per cent, are abnormal This we shall call method B In no instances were electrocardiograms, interpreted as normal by method B, abnormal by method A Six per cent of electrocardiograms normal by method A became abnormal by method B In 13 of 13 cases (100 per cent) in which method A established the location of a myocardial infarct, the same information could be obtained by method B However, location of myocardial infarction by method B yielded the same information in only ten of 13 cases (76 per cent) in which method A was used In no instance could more information be gotten from the combination of methods A and B than from either alone

The reasons for the difference in the percentages of abnormalities by methods A and B lie solely in the ability of unipolar extremity lead aVl to indicate high anterolateral wall infarction when all other leads, bipolar and unipolar, are normal This will be discussed in detail later

When unipolar precordial leads V_1 to V_6 are compared with the information from unipolar precordial leads V_1 and V_4, it is found that in 22 instances the six unipolar leads added further information In 14 cases, there was lateral wall damage as shown by abnormalities in V_5 and V_6, in four instances, there was septal wall damage as shown by abnormalities in V_2 and V_3, and in four instances there was septal and lateral wall damage However, in only three instances, one of septal involvement and two of lateral wall involvement, did these additional leads give the only hint of myocardial damage in the face of normal standard limb, unipolar limb, and precordial leads V_1, V_4, CF_1, and CF_4

Discussion

Value of the aVr in Myocardial Damage—An upright T wave in aVr is always indicative of myocardial damage In our series this was found

every case * This is an entirely insignificant figure, for a value of T = 2 5 (representing odds of 80 1 against chance occurrence) is usually accepted as the minimum for statistical significance It appears that there is actually no difference in the lymphocyte picture of the two groups, even though mere inspection of the percentage suggests what is often described as a "tendency" in the literature Statistical analysis, however, shows that this "tendency" is due to the variability of the samples and does not represent any real difference One must conclude, therefore, that even this third criterion speaks against any constitutional differences between the two groups

Discussion

As long as those who believe in a constitutional type of tuberculous patient continue to have relatively vague and indefinite criteria which are unsuitable for statistical or even objective evaluation, it will remain impossible to arrive at a definitive answer We have been forced to select as criteria for our study those features which are mentioned most often, which have the greatest potential significance, and which are amenable to mathematical analysis It is always possible that a selection of different criteria might yield other results

THE 98TH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION WILL BE HELD JUNE 6 TO 10, 1949, IN ATLANTIC CITY, NEW JERSEY

probably a matter of a sufficient number of precordial leads rather than whether they are unipolar or CF The value of precordial leads in the diagnosis of septal and lateral wall infarction is being stressed more and more [6]

An analysis of the data in this preliminary series of cases with reference to the comparison of the usefulness of the unipolar with the bipolar system reveals that a routine diagnosis of myocardial damage could be made by either system, excepting for the occurrence of high anterolateral wall infarction

Summary and Conclusions

1 In a series of 85 patients with heart disease, standard limb leads I, II, III and precordial leads CF_1 and CF_4 were compared with unipolar extremity leads aVr, aVl, and aVf and unipolar precordial leads V_1 and V_4 as to the presence of myocardial damage

2 Unipolar precordial leads V_1 and V_4 were compared with unipolar precordial leads V_1 through V_6 to estimate what further information could be obtained from multiple precordial leads

Six precordial leads give more information as to the presence of septal and lateral wall infarctions than do precordial leads V_1 and V_4 alone

3 The bipolar system and the unipolar system give the same information as to the presence or absence of myocardial damage except in high anterolateral wall infarction in which instance aVl may give the only clue to the diagnosis

FREE MEDICAL TREATMENT FOR FOREIGN VISITORS

An extraordinary provision of the National Health Service extends free treatment to foreigners visiting England A leaflet given to visitors arriving at British ports reads "The National Health Service will provide you with all medical, dental, and nursing care Everyone—including visitors to this country, whether of British nationality or not—can use all or any complete part of it There are no charges except for a few special items And no insurance qualifications are necessary" It is stated in the press that news of this British service has got around France and other countries Free National Health Service, dentures, spectacles, and even operations may be luring cross-Channel trippers to Britain. But the insanity of producing this last result seems to have dawned on our socialist rulers The Secretary of the British Medical Association reports that news has reached him, indirectly and not officially, that the Ministry has changed its view on the treatment of visitors from overseas It has now made a rule that the benefits of the National Health Service do not extend to overseas visitors, whether foreign nationals or citizens of the Commonwealth or Colonies, if those visitors come to the country for the specific purpose of using the service If, on the other hand, they should fall ill whilst here on a visit, they are entitled to use the National Health Service But the difficulty arises to determine whether the visitor came to the country for the purpose of obtaining medical treatment or not The *British Medical Journal* raises a legal point Either the Act does or does not entitle foreigners to use the National Health Service If it does, then a Government Department cannot make rules denying them the service If, on the other hand, the Act does not entitle foreigners to use the service, then the law is being broken by offering the service to any foreigner —*J.A.M.A., April 16, 1949*

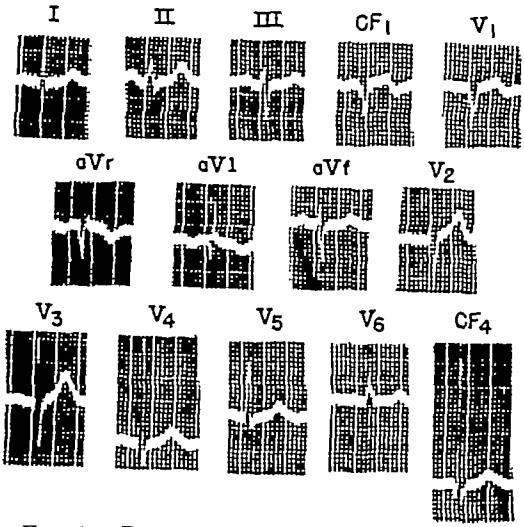

FIG 1 Diagnosis arteriosclerosis, enlarged heart dilated aorta, regular sinus rhythm, IIIc ECG showing normal standard and unipolar extremity and precordial leads excepting for aVl which shows a significant Q wave

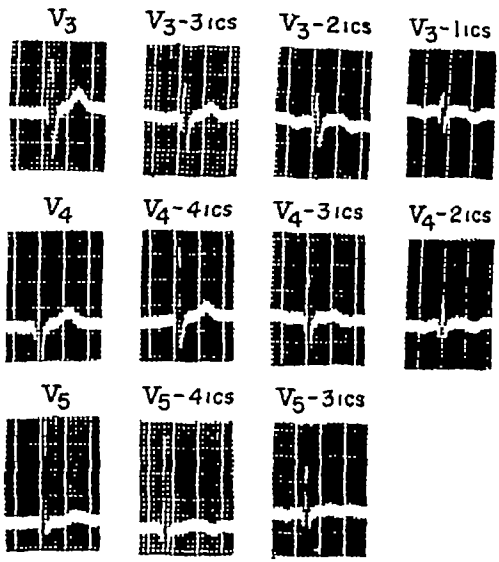

FIG 2 Same case as Fig 1 Unipolar precordial ECG taken at the usual location of V_3, V_4, and V_5 and at intercostal spaces above this Note the increase of the depth of the Q wave, the decrease in the height of the R wave, and the change in the direction of the T wave in V_3 This is taken as evidence of myocardial damage

16 times alone, twice in combination with a significant Q in aVl, and five times with a significant Q in aVf However, in all instances in which an upright T was present in aVr, the standard limb leads showed abnormalities indicative of myocardial damage

Value of the aVl in Myocardial Damage— The depth of the Q wave in the normal aVl varies between 0 5 and 3 0 mm and never exceeds 23 per cent of the height of the following R wave [2] A Q is normally present within these variations when the heart is in the horizontal position In three instances in our series, an abnormal Q wave in the aVl was the only abnormal finding in any of the standard limb or six precordial leads Since the unipolar extremity lead from the left arm faces the lateral wall of the left ventricle while the precordial leads do not face this surface, this abnormal Q wave in the aVl may be the only clue to high lateral myocardial infarction [3 4]

As suggested by Rosenbaum, "The chief indication for additional leads from the upper levels of the left thorax is the presence of changes suggestive of infarction in lead V_1 without corresponding changes in the standard leads from the left side of the precordium" [4] In three patients in this series in which aVl alone was abnormal, unipolar precordial leads were taken in the higher intercostal spaces at the location of V_3, V_4, and V_5 (Figs 1 and 2) The electrocardiogram taken at these upper levels of the left anterior chest wall revealed an increase in the depth of the Q wave, a decrease in the height of the R wave, and the presence of a diphasic or inverted T wave, all indicative of myocardial damage (Fig 2)

This would tend to eliminate the possibility, in this case as in the other two cases, that this unusual electrocardiographic pattern is due to rotation of the heart or some other change in the spatial relationship of the surface to the standard electrocardiographic leads [3]

Value of the aVf in Myocardial Damage— The unipolar lead aVf has, in the opinion of most students of this subject, been of the greatest value in distinguishing positional from structural changes in the heart [5] The significance of the presence of Q waves in lead III with regard to myocardial damage can be readily substantiated or denied by the presence or absence of a significant Q wave in aVf in myocardial damage The Q wave in aVf must be 0 04 second or more in width The Q must be 25 per cent or more of the height of the amplitude of the succeeding R waves In nine instances in our series significant Q waves were present in the aVf lead In every instance the diagnosis of posterior wall infarction could have been made in the standard leads

Value of the Precordial Leads in Myocardial Damage—In 22 instances in this series precordial leads CF_1 and CF_4 were inadequate to show damage present in the septum or in the section of the lateral wall covered by the precordial leads It is

probably a matter of a sufficient number of precordial leads rather than whether they are unipolar or CF The value of precordial leads in the diagnosis of septal and lateral wall infarction is being stressed more and more [6 7]

An analysis of the data in this preliminary series of cases with reference to the comparison of the usefulness of the unipolar with the bipolar system reveals that a routine diagnosis of myocardial damage could be made by either system, excepting for the occurrence of high anterolateral wall infarction

Summary and Conclusions

1 In a series of 85 patients with heart disease, standard limb leads I, II, III and precordial leads CF_1 and CF_4 were compared with unipolar extremity leads aVr, aVl, and aVf and unipolar precordial leads V_1 and V_4 as to the presence of myocardial damage

2 Unipolar precordial leads V_1 and V_4 were compared with unipolar precordial leads V_1 through V_6 to estimate what further information could be obtained from multiple precordial leads

Six precordial leads give more information as to the presence of septal and lateral wall infarctions than do precordial leads V_1 and V_4 alone

3 The bipolar system and the unipolar system give the same information as to the presence or absence of myocardial damage except in high anterolateral wall infarction in which instance aVl may give the only clue to the diagnosis

PROTAMINE EDEMA IN DIABETES MELLITUS

Preliminary Report

MORRIS ANT, M D , Brooklyn, New York

(From the Diabetic Service of Beth-El Hospital)

IT IS my intent to present some clinical observations on a number of diabetics who employed protamine zinc insulin exclusively over variable periods of time In many of these patients symptoms were recorded that simulated renal disease When protamine zinc insulin was withdrawn and regular or crystalline insulin substituted, the symptoms disappeared This reversibility led us to compare these observations to the syndrome of glomerular nephrosclerosis or Kimmelstiel-Wilson's syndrome, which is nonreversible

In studying the clinical manifestations a clear-cut picture of mild edema will become evident, and we have designated this protamine edema syndrome because it is found in patients who use protamine zinc insulin only In our opinion it puts the blame on protamine as the offender in initiating and accelerating serious degenerative vascular, metabolic, and infective complications.

Following our clinical observations we continued to look for some tangible laboratory support and further clinical evidence to verify our observations In the laboratory we found that every case of protamine edema recognized would show all or some of the following laboratory features (1) extremely low renal glucose threshold easily differentiated from renal glycosuria, (2) high blood cholesterol (a sign of poor dietetic control), (3) increased blood uric acid, and (4) increased blood creatinine content To further confirm our observation, we noted that the protamine edema disappeared on withdrawal of protamine zinc insulin and substitution of crystalline zinc insulin or regular insulin without any other change in therapy Finally, when the edema cleared, the blood cholesterol, uric acid, and creatinine returned to normal

I would like to give you a brief summary of a few representative cases that were observed over a period of years

Case Report

Case 1 L R , a man aged forty-nine, had been a diabetic for twenty-five years He gave a history of frequent infections, abscess of the neck, and diabetic retinitis He had been taking protamine zinc insulin, 40 units daily He appeared pale with wax-like skin, swollen periorbital tissue, and slightly swollen palpebral margins His blood sugar was 133 mg. per cent with glucosuria 3 per cent, urea nitrogen 26 mg per cent, cholesterol 250 mg per cent, and uric acid 4 7 mg per cent When the protamine zinc insulin was changed to the crystalline zinc form, three times daily and later twice daily, the blood sugar dropped to 110 mg per cent with negative urine The color of the skin improved, the swelling subsided, and the infection cleared up

Three years later he returned to the office because of an infection of the right big toe X-ray showed necrosis of the distal one third of the terminal phalanx The patient had been taking protamine zinc insulin daily for the past year, again the face appeared puffed, and he complained of feeling weak. The protamine zinc insulin was changed to the crystalline form Within two weeks his appearance improved, and the foot healed spontaneously in three months

Case 2—S T , a fifty-one-year-old woman, suffered diabetic neuritis of the hands and feet Her blood pressure was 190/110 The face appeared swollen, and the skin resembled the "myxedema" type. Lids and lid margins were thickened She had been taking protamine zinc insulin, but, when changed to the crystalline zinc insulin three times daily and later twice daily, her appearance returned to normal within a month She came in a year later, confessing that she had been taking protamine zinc insulin for the past six months She complained of general weakness and perspired freely Urine showed 1 to 2 per cent sugar, blood sugar was 110, urea nitrogen 38 mg per cent, creatinine 1 7, uric acid 2 9 After changing again to crystalline zinc insulin, within twenty days the urea nitrogen dropped to 29 mg per cent Two weeks later it was 24 mg per cent and the creatinine 1 3 Her general appearance again improved rapidly

However, a year later the same patient came to the office with definite findings of glomerulonephritis. Her blood pressure was 264/122, blood sugar was 246 mg per cent, urea nitrogen 36 4, creatinine 1 8, cholesterol 400, and uric acid 4 5 The skin was puffy with eyelid margins thickened, but there was no distinct pitting edema She admitted she had been taking protamine zinc insulin After a month of treatment with crystalline zinc insulin the blood pressure dropped to 190/100, and she was discharged improved

Case 3—L C , a forty-six year-old woman, showed symptoms of weakness, uncontrollable diabetes, severe headaches, and claudication Facies was swollen although there was no pitting edema Blood sugar was 285 mg per cent, urine 3 per cent, cholesterol 460, urea nitrogen 12 8 The liver was enlarged The patient had been taking 45 units of protamine zinc insulin daily, and when this was immediately changed to crystalline zinc insulin, there was remarkable improvement of the symptoms

A year later she developed a phlebitis, admitted having returned to protamine zinc insulin, and when she was changed to the crystalline form, her condition showed distinct improvement following four months' hospitalization

Case 4.—Another illustrative case was R. N., a woman aged fifty-two, who complained of vulvar itch and pains in her right large toe. The urine showed 5 per cent sugar. She was a distinct pituitary type and verified a suspicion of an adenoma by x-ray of the sella turcica. There was difficulty in controlling the diabetic state on 35 units of protamine zinc insulin, and she showed consistent weight gain. When changed to regular insulin three times daily, her diabetes was controlled completely. While on a vacation, she again resorted to protamine zinc insulin, and six months later all of the previous symptoms had returned.

Comment

These cases had several things in common. When patients were using protamine zinc insulin, they showed facial puffiness, thickened lids and lid margins, increased blood cholesterol, creatinine, and uric acid. All of the cases had a low kidney sugar threshold while on protamine zinc insulin. When the medication was changed to regular insulin, these conditions disappeared, showing that at this stage the pathologic physiology is reversible.

Many features of the cases I have just mentioned, as well as the other cases I have seen, may, on first impression, appear to resemble the syndrome reported by Kimmelstiel and Wilson[1], yet they differ, mainly in that the latter is irreversible. On closer inspection one notes that the Kimmelstiel-Wilson syndrome is a terminal stage of a progressively destructive vascular pathology. Extensive edema, heart failure, massive albuminuria, high blood urea nitrogen, and hypertension are mentioned, and it is noted that the cases occurred in patients of advanced age. In our cases there was a definite impairment of the concentrating power of the kidney, both for sugar and albumin.

It appears logical, therefore, that if a diabetic patient treated with protamine zinc insulin showed signs of the protamine syndrome, such as symptoms of slight facial puffiness or orbital lid puffiness, together with a blood chemistry of high cholesterol, uric acid, and creatinine, further advance of this syndrome might lead to intercapillary glomerulosclerosis, just as any other cause which leads to kidney pathology. On the other hand, if the protamine syndrome is kept in mind, a reversal to quick-acting insulin may prevent the advanced irreversible changes of kidney disease. Joslin pointed out that nephritis rarely occurs in the diabetic who controls the disease with diet and insulin.[2,3]

We can all accept Dolger's view that an accelerated arteriosclerosis is characteristic of diabetes mellitus.[4] Furthermore, this damage is most marked in the terminal vessels of the eye, kidney, heart, and extremities. The early finding of retinal hemorrhages, albuminuria, and hyptertension are evidence of such view. However, we disagree with Mirsky who states that "it makes little difference how the diabetic is treated. If he lives long enough he will develop one or another form of vascular disease."[5] This statement requires modification, especially in view of our clinical studies with protamine mentioned in this report.

Conclusions

On the basis of our observations the protamine edema syndrome seems to be characterized by (1) its appearance in diabetics using protamine zinc insulin exclusively, at any age and in both sexes, (2) anemia, (3) waxlike texture of the skin, (4) swelling of the periorbital tissues or edema, (5) edema of the palpebral margins, (6) slight pretibial or ankle edema with increasing edema in the surrounding tissues in complicating infections or vascular disease, (7) low renal threshold for glucose, (8) moderate albuminuria, (9) high blood cholesterol, (10) high uric acid, (11) high creatinuria, and (12) disturbed albumin-globulin ratio. All these symptoms and signs, as stated before, disappear on the discontinuance of protamine zinc insulin.

Protamine zinc insulin having been used extensively since 1936, it is possible that much of the increase in vascular degeneration noted may be due to the protamine used. I offer this as one explanation of the cause of accelerated vascular damage. Should this work be corroborated, it may open new avenues of metabolic research for better diabetic care and the reduction of vascular damage in the diabetic.

THE PSYCHOSOMATIC STATUS—GASTRODUODENAL ULCER AND VAGOTOMY

ABRAHAM O WILENSKY, M D ,* New York City

THERE is no doubt that, no matter what the primary cause of gastroduodenal ulcer may eventually be proved to be, there are two important factors which go into the total, presently recognized concept of ulcer formation. American thought has assumed the overpowering importance of gastric hyperacidity and hypersecretion almost to the exclusion of any other factor Experimentally, Carlson has shown that a continuous gastric secretion occurs which is not necessarily dependent on the presence of food and is neutralized by the mucus of the pyloric antrum, by the saliva, and by regurgitated duodenal contents If this neutralization is for any reason inadequate, pure gastric juice accumulates in the stomach Excessive secretion of gastric juice, produced by histamine, fairly regularly produces ulcers in all the common laboratory animals This leads to the concept that the hypersecretion of gastric juice in gastroduodenal ulcer is largely neurogenic and is the basis of ulcer

There is no doubt also that gastroduodenal ulcer has marked psychosomatic factors A defect in the stomach or duodenum is objectively real to the roentgenologist, surgeon, and internist and subjectively real to the patient because of its symptomatology Nevertheless, there is no doubt that the strains and tensions of modern life produce mental conflicts, and the reactions to them transmitted along vagus pathways result in increased gastric motility and vascularity and decreased mucin formation, all of which are highly conducive to ulcer formation

Fundamentally, the ulcer "diathesis" resides in the basic character structure of the individual which readily thrusts the patient into the peptic ulcer type of situation The emotional reaction of the patient becomes of greater significance than the effect of any particular diet or drugs utilized in the treatment This concept affords a better understanding of the many confusing manifestations of the ailment and makes available a more flexible and effective approach to them In any event, the psychosomatic influences are strong and play an important part in the ulcer syndrome and its manifestations

Apparently, these physiologic concepts are also clinically sound The realization by Hartzell that the neurologic pathways in either case are through the vagi nerves suggested the experimental demonstration of the effect of complete section of the vagus nerves in decreasing or abolishing gastric acidity, incomplete section was disappointing

The present enthusiasm for vagotomy and vagus neurectomy is based on this concept Much concern with technical matters considers the importance of complete division of the vagus fibers, if success is to be assured, and a distinction must be made between vagotomy and vagus resection or neurectomy The anatomic patterns of the vagus nerves in about ten per cent of the cases are not uniform, numerous branches of the esophageal plexus fail to form into common trunks on one or both sides of the esophagus, and there is difficulty in isolating and sectioning all the gastric nerves This seems to justify the thoracic operative approach as the best method of obtaining complete division of all the vagus fibers Complete division of the nerve trunks of the vagus is the accomplishment desired and the method of choice Otherwise, the procedure, in effect, is really a "stripping" of the vagus fibers from the esophageal wall from the level of the hilum to the gastric fundus

Nevertheless, recent anatomic investigations show that in slightly more than 90 per cent of the cases, a transabdominal subdiaphragmatic surgical approach will allow as nearly a complete division of all the gastric nerves as will a transthoracic approach In addition, the abdominal approach allows exploration of the abdominal contents and, especially, of the ulcer, to enable recognition of any malignancy If gastric atony or obstruction is present, or likely to follow later, a drainage operation also can be done on the stomach simultaneously

In any event, the possible technical difficulties are, therefore, of an inherently anatomic nature and undoubtedly lead to some of the unsuccessful results In any event, the necessity of repeated physiologic tests to determine residual vagal innervation of the gastric glands is clear in order to make sure that no other reason is present for any nonsuccess of vagotomy

In either case, and with modern safeguards and technic, the operation is not unduly difficult The mortality is very small in competent hands In the cases operated on through the chest, pulmonary complications are not difficult to handle

Because of the neurologic functional changes, the postoperative management must extend for a considerable time—three months or more—and

* Dr Wilensky died on February 4 1949 Therefore only editorial corrections have been made on this manuscript

consists essentially of aiding the stomach to overcome the changes in gastric motility, especially since many patients who have been thus tided over a bout of motility symptoms have remained well subsequently

Up to the present time, vagotomy or vagus neurectomy has been done as the sole primary procedure, or has been done secondarily after previous gastric resection, gastroenterostomy with or without other procedures such as local excisions, or pyloroplasty The immediate operative mortality is around one per cent, and the late mortality is about the same, according to the published reports

Cases with refractory ulcers of long duration and intractability of symptoms in which vagus resection was done have been reported by many authors [1-8] Good results were reported by these various groups As shown by the sum total of the reported observations, bilateral complete vagus resection apparently does the following things It relieves ulcer pain immediately, followed by healing of the ulceration It will decrease or abolish the gastric acidity, decrease hypersecretion, and decrease hypermotility These are desirable effects because they are constant, symptom-producing accompaniments of ulcer

The most pronounced effect of the operation is apt to follow in the younger group with duodenal ulcer who present, in varying degree, other signs of nervous tension and instability

Most observers have found the relief of pain "striking" In contradistinction to this, the Mayo group has found the relief of pain "good" but not striking, and "inconstant, variable and unpredictable otherwise" [9] The complete relief of pain after vagotomy is not an unmitigated blessing and is fraught with danger Recurrent ulceration, perforation, and obstruction may be difficult to recognize [1] Such experiences have already occurred even as close as fourteen days after gastric neurectomy and gastroenterostomy [1,9,10]

The reduction in gastric secretion produced by complete vagus division corroborates the premises that hypersecretion is neurogenic in character The decrease in fasting acidity which follows vagotomy gradually returns toward normal, until, at the end of a year, little abnormality can be found The secretory response to insulin-induced hypoglycemia remains abolished in most cases, and the clinical well-being of the patients also appears to outlast the duration of the early secretory and motility changes

Operation is followed by changes in gastric motility with reduction and possible disappearance of any hypermotility Nevertheless, in the satisfactory cases, most of the cases showed a normal tonicity at the end of the first year

Gastroscopy shows a *patulous antrum* and lessened peristaltic activity after vagotomy After subtotal gastrectomy and vagotomy, gastroscopy frequently shows edema, erosion hypertrophy, and friability in the residual gastric pouch and the attached jejunum

The available facts suggest strongly that any prolonged relief which this surgical procedure confers upon the patient is due "to some more subtle effect" which is "traceable to severance of those nervous pathways which communicate the patient's adaptive reactions from the brain to the stomach" After resection of the nerves such impulses cannot reach the stomach

In the primary vagotomy or vagus resection cases, between 85 and 90 per cent have good subjective results for periods up to thirty months postoperatively, but in half of these the results are not quite so satisfactory as in the others In the series reported by Grimson *et al* completely satisfactory results after transthoracic vagotomy alone were obtained in only 25 per cent of the cases [3] About 10 to 15 per cent of the cases have a frankly poor result, either with a demonstrable recurrence or symptoms of ulcer A similar number have sufficiently severe side-effects to detract materially from their satisfaction with the result Cases which had gastrojejunal stomas, either primary or secondary, have the same incidence of distressing side-effects

The unsatisfactory results after vagotomy are due to the following (1) vomiting during the first several months, (2) hematemesis, (3) melena, (4) recurrent severe abdominal pain and distension, (5) fullness after eating, (6) temporary or continuous foul eructations, (7) continuous or periodic looseness of stools, and (8) serious diarrhea

The greatest difficulty has been the occurrence of obstruction at the outlet of the stomach with retention of the gastric contents and dilatation In some cases, the obstruction is cicatricial, in others the removal of vagus control produces a failure of coordination between contraction and relaxation waves at the pylorus and a relative obstruction termed "achalesia" by Hurst There is a strong temptation to do gastroenterostomy under these conditions, but it can usually be avoided Nevertheless, in actual practice, secondary gastroenterostomy was done in 10 per cent of the various groups of cases in the first three months after operation It is pointed out that, as treatment for frank obstructions, the procedure is usually effective, but, as a means of avoiding other gastrointestinal side-effects, it is ineffective

Under certain conditions disturbances of motil-

ity and of secretion are more apt to follow. According to Moore *et al* the immediate combination of vagus resection and gastroenterostomy does not seem appropriate in cases with frank cicatricial obstruction, according to the Mayo Clinic group similar disturbances have followed excision of the ulcer-bearing area with vagotomy [7–9] In the Johns Hopkins group, all of the failures occurred in the patients who had vagotomy without any additional operative procedure, either plastic or ablative, on the stomach itself [1] The results have been uniformly satisfactory in the 24 patients undergoing some such procedure in addition to vagotomy The most satisfactory results of all occurred in the ten patients in group three who had gastroenterostomy or pyloroplasty along with vagotomy Such contradictory statements are somewhat difficult to understand

One must agree with the conclusions of the Mayo group—that if lasting and persistent good results could be assured, vagotomy or vagus neurectomy would offer an easy and comparatively safe method of treating certain peptic ulcers, especially recurrent ulcers [9] However, if one is to employ this procedure in the management of gastroduodenal ulcer, the position of the Lahey Clinic seems, for the present, sound "To make use of it in secondary operations in a patient who had had a subtotal gastrectomy and then had a recurrent jejunal ulcer, the reason for this being that even though atony in the remaining stump is produced, there is still good drainage as there is no contracted pylorus to produce obstruction, and, in addition, the technical difficulties of a second subtotal gastrectomy in the presence of a jejunal ulcer can be considerable" They also employ infradiaphragmatic vagotomy in most of the patients upon whom subtotal gastrectomy is done for duodenal ulcer in the hope that, by means of this, they can possibly cut down the incidence of gastrojejunal ulcer and recurrent bleeding Their third suggestion is "to reserve any cases of duodenal ulcers in which vagotomy is to be employed to one in which it would seem unlikely that, with the healing of the duodenal ulcer, pyloric obstruction would occur and gastroenterostomy becomes necessary" [11] Unfortunately, such a state cannot accurately be predicted

The comment of Moore *et al* and of the Lahey group should be well taken—that when vagotomy or vagus neurectomy is combined with other operative procedures, gastroenterostomy, resection, etc, the correct interpretation of the therapeutic effect of the former becomes confused [7 8 11] It becomes impossible to attribute the success of the operation to vagus resection alone, since good results have previously been obtained with the other operations alone One must not forget the terminal fate of many other similarly enthusiastic proposals, the most prominent and recent of which was total thyroidectomy for heart disease One must keep this in mind to prevent our running away now with vagotomy and vagus neurectomy in its stage of initial enthusiasm.

Summary and Conclusions

In gastroduodenal ulcer, the two important symptom-producing factors are hyperacidity and hypersecretion and a psychosomatic status Both of these depend upon a neurogenic basis, and the effects of the latter are transmitted to the stomach along the vagus nerves This concept furnishes the basis for vagotomy and/or vagus neurectomy

At the present writing, and in any event, vagotomy is essentially a symptomatic form of treatment in such an individual in which the symptom-producing effects of the fundamental neurogenic basis are blocked in their transmission and are vitiated by division or excision of the vagus nerves The available evidence indicates that the efficacy of vagotomy or vagus neurectomy as a temporary or permanent, alleviating, curative and/or preventive measure, the potential dangers of this procedure, and the question of ultimate regeneration of the divided nerves have still to be judged finally in the fire of continued, repeated trial and prolonged observation

THE DATES FOR THE A.M.A. CONVENTION ARE JUNE 6 THROUGH 10, AT ATLANTIC CITY, NEW JERSEY

ACUTE GENERALIZED PERITONITIS DUE TO SPONTANEOUS RUPTURE OF PYOSALPINX

GEORGE H ROMBERG, M D , F A C S , White Plains, New York

(*From the Department of Gynecology, Hospital for Joint Diseases*)

SPONTANEOUS rupture of a pyosalpinx is one of the rarer causes of acute generalized peritonitis Bonney reported a case of rupture of a pyosalpinx and carefully reviewed 44 other authentic cases collected from different sources [1] Bovee collected statistics from 55 cases and submitted the history of an additional case which occurred in his own practice [2] In the majority of the reported cases there was no assignable cause for the rupture Norris found 99 cases of ruptured pyosalpinx with peritonitis in the literature [3]

Huet recorded the common mechanical causes for the rupturing of a pyosalpinx [4] He emphasized the need for differentiation between traumatic rupture and nontraumatic perforation, since the mortality rate of the former is much less than in the latter group With the fallopian tubes protected as they are—laterally by the bony wall, below by the strong perineum and the intervening structures, and above by the thick layer of intestines and the abdominal wall—rupture resulting from accidental trauma is of rare occurrence Rupture caused by ill-advised or too vigorous bimanual examination has been reported by various authors

Feeney stated that the sum total of cases of spontaneous rupture of pyosalpinx in the literature was less than two hundred fifty, and he questioned whether this figure underestimated the frequency of the condition [5]

In a brief paper, such as this, the pathology of pyosalpinx need not be reviewed It is generally accepted that the gonococcus is the responsible organism in about 75 per cent of the cases The streptococcus, tubercle bacillus, staphylococcus, and other miscellaneous organisms have also been the causative agents It is also generally known that the cultures from the pyosalpinx due to the gonococcus later become sterile It is interesting to note that spontaneous rupture of pyosalpinx occurs more commonly on the right side, in spite of the bilateral involvement The clinical history varies, but, in general, it is usually one of sudden onset of severe pain in the lower abdomen, more marked on the right side, with progressive spread of symptoms to the entire abdomen suggesting local and generalized peritonitis The diagnosis is rarely made preoperatively, usually being mistaken for peritonitis secondary to a ruptured appendix In the differential diagnosis other conditions such as ruptured appendix, ruptured tubal pregnancy, and ruptured gastric and duodenal ulcers have to be considered

The treatment is by surgical intervention Some insist on a salpingectomy or a panhysterectomy, others leave the ruptured tube *in situ* and establish peritoneal drainage with a Penrose drain or some similar material Gastric and intestinal drainage plus intravenous fluids, with maintenance of normal protein and electrolyte balance, are used when paralytic ileus is encountered The use of penicillin and the sulfonamides, together with spinal anesthesia, have aided in the salvage rate of this condition.

The following case of spontaneous rupture of pyosalpinx is taken from the author's own practice

Case Report

The patient was a white, married woman of forty-eight years who was admitted to the White Plains Hospital on February 17, 1946, complaining of severe abdominal pain which had begun eight days previously The patient was somewhat hazy about the character of the pain during the following few days, but she spent most of the time in bed Flexing the knees on the abdomen would somewhat relieve her pain There was occasional nausea but no definite vomiting She was up and about part of the time, but walking was possible only in the bent-over position Movement of her legs caused abdominal distress She also noted definite abdominal distension with bloating and increasing inability to pass flatus There were no chills or urinary symptoms During the two days prior to admission there was increased intensity of pain all over the abdomen

Her past history was noncontributory There had been menopausal symptoms for the past year She had never been pregnant

On examination, the temperature was 102 6 F , pulse 102, and respirations 15 She appeared acutely ill and dehydrated During the examination she complained of intermittent abdominal pain going from the symphysis pubis to the epigastrium with some radiation to the right side Lips and tongue were dry, and the heart and lungs were negative Blood pressure was 120/80

The abdomen was of symmetric configuration and slightly distended During episodes of pain one could not observe any outline of intestinal peristalsis There was a hypertympanitic percussion note throughout the abdomen except for a dull area two finger-breadths above the symphysis and in

both abdominal flanks There was limited abdominal respiratory movements, and these were associated with definite intra-abdominal pain Palpation revealed quite pronounced muscle rigidity (not boardlike) throughout There was exquisite tenderness throughout the abdomen on direct pressure Oscultation revealed no peristaltic action

On pelvic examination only pronounced tenderness in the rectopelvic shelf could be made out

The results of the laboratory examination were as follows red blood cells 4,450,000, hemoglobin 13 7 Gm., color index 0 97, white blood cells 5,100, polymorphonuclears 80 per cent Urine was acid, specific gravity 1 023, sugar negative, albumin heavy trace, acetone 4 plus, microscopic 8 to 10 pus cells, per high power field—moderate number of red blood cells and many hyaline casts

The diagnosis at this time was diffuse peritonitis and intestinal obstruction It was impossible to determine whether the intestinal obstruction was on a mechanical basis or whether it was a secondary paralytic ileus due to the peritonitis.

Soon after admission, the patient was given 2,000 cc of 5 per cent glucose in saline intravenously Penicillin and sulfadiazine therapy were instituted Twelve hours later the blood chemistry was checked with the following results hematocrit 38 9 per cent, chlorides 552 mg per cent, carbon dioxide combining power 46 volumes per cent, serum amylase 121 Somoggi units per cent, total plasma protein 6 0 per cent Blood count was as follows red blood cells 3,950,000, hemoglobin 12 6 Gm , color index 1 0, white blood cells 18,650, neutrophils 85 per cent, nonsegmental forms 64 Urine showed a trace of albumin, and microscopic examination showed a moderate number of white blood cells, many red blood cells, and no casts Radiographic examination of the chest by means of bedside unit showed some congestion in the right central lung field There was no evidence of lung consolidation or pleural effusion Flat plate of abdomen showed no conclusive evidence of rupture of a hollow viscus The latter exposure showed a suggestion of free air No evidence of obstruction in the small intestine

An exploratory laparotomy was performed February 18, 1946 A lower right rectus incision was made under spinal anesthesia On opening the peritoneal cavity about 1,000 cc of seropurulent fluid was found spread over the entire cavity The ileocecal region was explored The base of the appendix appeared edematous, and the distal portion could be palpated retrocecally but could not be visualized The appendix was removed in retrograde fashion, and it was then apparent that it was secondarily involved and was not the primary cause for the peritonitis The right adnexal region was then explored and the seat of the trouble immediately recognized There was a rent 1½ cm. in diameter on the upper midportion of the right pyosalpinx from which oozed grayish-white, seropurulent fluid There was a similar pyosalpinx in the left adnexal region, both measuring approximately 7 by 3 by 2 cm The uterus was injected and covered by fresh fibrinous exudate similar to that found on the coils of the small intestine in juxtaposition Three Penrose drains were inserted in the right pelvis and right lumbar gutter Routine closure in layers of abdominal wall was done

Culture of abdominal fluid revealed the following Microscopic examination showed many pus cells (polymorphonuclears 90 per cent) Of the four stained films studied, one film revealed presence of one short-chain, gram-positive, lancet-shaped diplococci Microscopic examination of both aerobic and anaerobic cultures failed to reveal the presence of bacterial growth after four days' incubation

The postoperative course was rather uneventful except for the first three days The day after operation the patient had a bout of dyspnea which followed an effort to expectorate some thick mucus Temperature was 99 8 F by rectum, pulse 120, and respirations 22 Examination of the chest revealed rales and rhonchi at the left base The following day the patient became more dyspneic and also cyanotic The pulse rate increased to over 200 per minute An electrocardiogram tracing at this time was reported as showing sinus tachycardia. The patient was readily relieved of her dyspnea by oxygen administered under positive pressure (Barach-Eckton mask) She was given two transfusions of 500 cc of whole blood Penicillin and sulfadiazine therapy continued The abdomen was moderately distended for four days postoperatively Some soft stool and flatus were passed by rectum Check x-ray examination of the chest five days postoperatively showed a right pleural effusion The effusion obscured the dependent portion of the right lung and the heart border Following the acute episode on the second postoperative day, the pulse and temperature remained normal throughout the course in the hospital The abdominal drains were removed on the eighth day The abdominal distension decreased after the third day, and the patient's appetite improved immediately after regular passage of flatus and stool on the fifth postoperative day When the patient was about to be discharged, she complained of some fleeting abdominal cramps following ingestion of food Her abdomen was soft at this time, there were no tender areas, bowels were moving normally, temperature and pulse were normal At time of discharge, twenty-one days postoperatively, the wound had healed per primum and the sinus drainage site had closed

Following discharge the patient was up and about, enjoying good health Occasionally she complained of transient abdominal cramps following ingestion of food On April 1, 1946, three weeks after discharge from the hospital, the abdominal cramps suddenly became aggravated There was slight nausea but no vomiting or distension

She was readmitted to the hospital for observation. On examination, she appeared acutely ill The temperature was 99 5 F , the pulse 90 Periodically, during the examination the patient doubled up because of abdominal pain The cramps recurred every three to five minutes There was moderate abdominal distension The abdominal wall moved with respiration No intestinal patterns were seen There was marked tenderness in midabdominal region extending to the left Left rectus muscle was spastic with borborygmus on the left

After twenty-four hours of observation, during which time intravenous fluids had been given and Miller-Abbott tube had been passed, it was deemed advisable to explore the abdomen Preoperative diagnosis was intestinal obstruction Spinal anesthesia used A lower right rectus incision was made lateral to the previous incision On entering the peritoneal cavity, a coiled mass of adherent small bowel was seen just medial to the incision These were separated by sharp and blunt dissection It was then possible to visualize the dense fibrous adhesions between the right tube and the terminal portion of the ileum and the lower angle of the wound. The small intestine above this area was dilated while the portion below the constriction was narrowed The entire small intestine was mobilized into the wound and checked from the ligament of Treitz down to the ileocecal region Several fibrous bands were severed in the ileal portion of the bowel. Abdomen was closed in layers The patient was discharged on the fourteenth day of the last admission The patient's course since that time has been entirely uneventful

Summary

A brief review of the literature of spontaneous rupture of pyosalpinx plus a brief history of a personal case are presented The purpose of presenting this case is to emphasize the need of considering ruptured pyosalpinx in the differential diagnosis of peritonitis in women

THE "MEDICAL" TREATMENT OF PILONIDAL DISEASE

Herbert Berger, M D , Tottenville, New York

(From the Department of Medicine, Richmond Memorial Hospital)

THERE exists general dissatisfaction with the treatment of pilonidal disease because of the high rate of recurrence Any review of the literature, which has grown voluminous, reveals practically as many methods of treatment as there are surgeons The battle between open versus closed procedures goes on with innumerable methods of eliminating "dead space" Procedures for grafting new skin, pressure bandages, etc , are published frequently

With considerable trepidation another method is here suggested It has the advantage of being wholly an office, outpatient, or, in acute abscesses, a home treatment, easily performed, requiring no expensive hospitalization, no anesthetics, and no loss of time from work

Interest in the subject started during my period in the armed services where many of these cases were first seen If an acute accumulation was present, these patients were treated by simple incision and packing with tyrothricin [1] This is readily done by soaking gauze wicks in commercial, freshly diluted tyrothricin The dilutions are made by adding 60 cc of sterile distilled water to 15 drops of tyrothricin Sufficient packing was introduced to fill the area loosely This was secured in place with waterproof adhesive plaster

These men were not hospitalized They came in to the sick bay for moistening of the area with tyrothricin twice daily if they lived on the base, or it was attended to by themselves or a member of the family if they lived at home The patient was instructed to wet the packing every three hours He was given a test tube with a line marked on it with a glass file indicating 60 cc This he filled to the mark with boiled tap water, then added 15 drops of tyrothricin for each day's supply of the agent He was advised that a new dilution had to be prepared each day The physician inspected the area at intervals of several days to a week depending on the quantity of discharge At each visit the packing was removed (soaking with peroxide making this procedure fairly painless), and less packing was replaced until none was necessary

Even in the case of acute abscess, it is rarely necessary for a patient to be hospitalized The area can often be incised on the first visit, since the infection appears in a previously existing cyst

In only one of 40 cases was there cellulitis about the infected cyst, which required three days in the sick bay

Acute cases give symptoms only when infected, and the infection responds readily to installation of tyrothricin This can be introduced with a medicine dropper applied to the small sinuses, or, preferably, the sinuses should be connected by a linear incision under novacaine which facilitates the introduction of the tyrothricin pack

These military patients did well and were asymptomatic Unfortunately, the shifting about of naval personnel rendered long follow-

[1] To close cyst or render free of infection so that morrhuate could be started.
[2] Draining or nondraining sinus infection, or abscess
[3] Intracystal injection not done as small open sinus permitted sclerotic to leak out
[4] Patient had 5 weekly pericystic injections 2 fortnightly intracystic injections
[5] Patient had 4 weekly pericystic injections and 4 fortnightly intracystic injections
[6] Acute abscess.
[7] There are several additional cases which have not been followed sufficiently long to report but they are progressing much as are the above.

up of these individuals impossible However, all of those treated continued their usual activities One was not at all certain that these were cures since, as stated above, they were not observed for sufficiently long periods

Since my return to civilian practice, the same methods have been used, and follow-up studies have been possible The patients reported in this paper were all treated in my office and have been seen personally (Table 1)

The method described rendered patients asymptomatic but, as might have been anticipated, was rarely a cure, since evidence of continuing disease reappeared in 12 of 15 cases Patients were not disabled by these recurrences, however In one, the sinuses reappeared and were objectionable because of the odor of the discharge This was successfully re-treated by the original method

In all cases after treatment the sinuses closed for a while, but evidence of the continued presence of the cyst was noted by the thin appearance of the skin over the cystic area or by subsequent infection or opening of the sinus

Consequently, an effort was made to obliterate the cyst as soon as the sinuses closed, following the tyrothrycin therapy, by the introduction of 5 per cent sodium morrhuate into the cyst The 27-gauge 1-inch needle was never introduced into the cyst through the midline but rather through the skin about ½ inch lateral to the cyst margin Enough morrhuate was injected to distend the cyst When the needle was introduced in the midline, the newly healed tissues always lacked sufficient elasticity to close the needle hole, and the morrhuate solution leaked out and the sinus recurred A procaine wheal raised at the site of the introduction of the needle renders this procedure painless Patients were instructed to return at fortnightly intervals, and injection was carried out repeatedly until the cyst was a firm scar This required from one to 12 injections

In some cases the cyst never closed without sinus formation even after the tyrothrycin dressings were applied (four of 15 cases) In these individuals instillation of the morrhuate solution always failed, since it ran out of the sinuses In these cases the morrhuate was introduced again from the side, but the scarified area was at the base of the cyst (in the healthy tissue). In two cases repeated injections, at weekly intervals, of ½ to 1 cc of 2 5 per cent solution built up a scar which gradually obliterated the cyst from the bottom In the course of this treatment two of the sinuses closed so that again the cyst itself could be distended with 5 per cent solution as described These then healed promptly The remaining two cases have healed as well but took considerably longer (18 to 24 injections)

All of these cases have now been followed a minimum of one year, and they have remained cured thus far, by cured I mean there is no sinus and no evidence of cyst There is scar tissue The patients are highly pleased, particularly those who had undergone previous surgery They have been instructed that the cysts may break down and require further treatment, but they do not seem discouraged since they will not need an operation

This series is small, but it suggests that pilonidal disease may be treated conservatively with antibiotics during the acute phase and with obliteration of the cyst by sclerotics after the infection has subsided

PAPAVERINE IN EPILEPSY

HENRY I RUSSEK, M D, F A C P, and BURTON L ZOHMAN, M D, Staten Island, and Brooklyn, New York

(From the Cardiovascular Research Division, U S Marine Hospital, Staten Island)

THE HYPOTHESIS that the epileptic attack is due to cerebral vascular spasm has been generally abandoned within recent years Nevertheless, experimental support for a vascular basis in epilepsy is offered by the observation that at the onset of a "fit" there is intense pallor of the cortex of the exposed brain [1] That interruption in the blood supply to the brain may be one significant factor in the precipitation of seizures is further suggested by the occurrence of convulsions in animals following occlusion of the circulation to the head The clinical observation that amyl nitrite may abort a seizure if administered early during a long aura is also in accord with the view that cerebral vasoconstriction is causally related to the epileptic attack.[2] Theoretically, therefore, the administration of a vasodilating drug capable of prolonged effect may have prophylactic value in the treatment of this disease

Earlier experience with papaverine in the management of "hypertensive" encephalopathy, a syndrome also considered to be dependent upon cerebral vascular spasm, led the authors to a consideration of this drug for epilepsy [3] In the previous study, moreover, this disease was not definitely excluded in a few of the cases which showed striking response to treatment It seemed desirable, therefore, to observe the action of papaverine on patients in whom the diagnosis of epilepsy had been clearly established. That this drug might have prophylactic value in the control of grand mal seizures was further suggested by its reported effectiveness, administered intravenously, in successfully terminating status epilepticus [4]

In the cases herein reported, papaverine hydrochloride was administered orally in large doses to two patients who had failed to respond satisfactorily to the usual measures employed in the treatment of this disease

Case Reports

Case 1—J K, a six-year-old white boy with a history of convulsions at six weeks of age, sustained a head injury followed by a generalized convulsive seizure at the age of three years One year later he suffered a third generalized convulsion and was hospitalized at the Neurological Institute

Examination was essentially negative X-ray of the skull did not reveal evidence of fracture or increased intracranial pressure Psychometric examination disclosed an intelligence quotient of 111 Pneumoencephalogram was not performed The electroencephalogram was grossly abnormal A diagnosis of idiopathic grand mal was made Patient was placed on dilantin and phenobarbital, 1/2 grain each three times a day, upon discharge from the hospital.

During the ensuing twenty-one months the seizures gradually increased in frequency and severity, in spite of appreciable increase in the dosage of these drugs On examination in March, 1948, the convulsive seizures were recurring approximately two to three times a month Each episode was preceded by an aura of "black spots" in front of the eyes Three of the seizures were followed by a temporary left hemiparesis which persisted for several hours Dilantin was discontinued at this time, and papaverine hydrochloride was substituted in the dosage of 2 grains four times a day No recurrence of seizures has developed on this regime during a period of six months, although on a dozen or more occasions the patient has had the usual aura without subsequent onset of convulsive attacks

Case 2—A. L, a thirty-two-year-old white man, gave a history of recurring "fits" since the age of six years The attacks were generally preceded by visual aura when the patient was awake Most episodes, however, occurred during sleep The attack was characterized by a generalized convulsive seizure during which there was biting of the tongue and incontinence of urine and feces Within recent years the episodes had increased in frequency so that in May, 1947, they were recurring two or three times a week.

On physical examination the patient responded to questions in a slow deliberate monotone. There was a set, masklike facies Skin showed dermatographia Neurologic examination revealed increased superficial and deep reflexes There was a slight intention tremor There was no evidence of increased intracranial pressure Kahn test for syphilis was negative. Electroencephalogram was interpreted as indicative of grand mal

Patient was given 1/2 grain of phenobarbital and one and one-half grains of dilantin four times a day for a period of six months On this therapy there appeared to be only slight improvement. In November, 1947, dilantin was discontinued and three grains of papaverine were administered with the previous dosage of phenobarbital four times a day

Two attacks developed during the ensuing month Papaverine was then increased to 4 1/2 grains four times a day No attack has occurred during a period of eight months on this therapy Substitution of placebo medication, however, for a period of

Published with the permission of the Surgeon General U S Public Health Service Washington, D C

one week, resulted in the development of two episodes.

Discussion

Most authorities no longer accept the view that cerebral angiospasm may be a link in the chain of reactions which terminate in the epileptic attack They point out that "the cerebral arteries are feebly contractile vessels showing little or no reaction to vasoconstrictor agents "[5] It cannot be denied, moreover, that only slight constriction has been evoked by such measures as stimulation of the cervical sympathetic fibers and direct application of epinephrine to the cerebral vessels On the other hand, physiologists have long maintained that the cerebral arteries respond paradoxically to sympathetic nerve stimulation by dilatation, a mechanism designed to maintain blood flow during states of shock or flight A more recent view, however, is that these vessels are maintained in a state of tonic dilatation by humoral vasodilators [6] Thus, in either case, failure of the cerebral vessels to respond to sympathomimetic agents must not be construed as evidence that these arteries are incapable of undergoing spasm Intense constriction of the pial arteries has actually been observed in animals following both electrical and mechanical stimulation [5] Indeed, the most direct support for a vascular basis in epilepsy has been the observation of marked spasm of the arteries of the exposed cortex following an epileptic attack induced by electrical stimulation [1] To the argument that the weak media of cerebral vessels cannot sustain appreciable constriction may be opposed the fact that the retinal arteries, whose structure is similar, can frequently be seen to do so [7]

Two cases of epilepsy have been presented in which cessation of attacks appeared to be directly related to the administration of large oral doses of papaverine several times a day These observations are being reported in the hope that they will stimulate further investigation Possible benefit from this drug may also be anticipated in the vasoconstrictor phase of migraine in which phenomena of an epileptic order have been observed [8] It cannot be emphasized too strongly that dosage as high as 15 or 18 grains per day may be necessary for therapeutic response

The possibility exists that epilepsy may be closely related in pathogenesis to the syndrome of vascular encephalopathy from which it may be clinically indistinguishable Conversely, it has been suggested that hypertensive encephalopathy may, in reality, be based on constitutional dysrhythmia of the electrical brain waves just as in epilepsy [7] In the former condition the rise in arterial pressure has been regarded as the trigger mechanism to initiate the attack. Thus it has been postulated that the difference between the seizures in these conditions "might be due simply to the hypertensive substrate on which the seizure plays" On the other hand, similar cerebral episodes may occur in the absence of hypertension, as, for example, in cerebral arteriosclerosis, acute glomerulonephritis, and lead poisoning [3] Obviously, then, other trigger mechanisms must exist besides the hypertensive one Further clinical, experimental, and electroencephalographic investigations may reveal that the seizures and electrical brain wave alterations in these varied conditions have a common vascular basis, namely, cerebral angiospasm The apparent response of epilepsy and vascular encephalopathy to large doses of papaverine tends to support this hypothesis

Summary

Evidence exists to support the view that cerebral vascular spasm precedes the epileptic attack Favorable response to papaverine in the treatment of cerebral angiospasm associated with hypertensive disease suggested the use of this drug for epilepsy Two cases are presented in which large oral doses of papaverine prevented grand mal seizures which previously had failed to respond to the usual measures employed in the treatment of this disease Further studies are indicated to evaluate this therapy for epilepsy and for the vasoconstrictor phase of migraine Dosage as high as 15 to 18 grains per day may be essential to a satisfactory response Epilepsy and vascular ("hypertensive") encephalopathy may differ only in the manner in which underlying cerebral vascular spasm is initiated

THE ADDITION OF NIACIN TO PROCAINE HYDROCHLORIDE FOR INTRAVENOUS ADMINISTRATION

Preliminary Report

DAVID J GRAUBARD, M D , EUGENE NEUWIRTH, M D , and JOSEPH KOVACS, M D ,
New York City

CLINICAL investigation of the intravenous administration of procaine hydrochloride has indicated that the results achieved by this method are based on the diminution of vasospasm and, as a corollary, the relief of pain [1-3] Since it has been demonstrated that niacin or nicotinic acid has a vasodilating effect, especially upon the capillary bed, investigation of the combined simultaneous administration intravenously of procaine hydrochloride and niacin was undertaken at the suggestion of one of us (E N) [4-9]*

This report is based on the combined use of these drugs in 47 cases with a total of 142 infusions An additional 22 patients who were given 43 infusions of niacin-procaine hydrochloride are not included in this series because they represent our early investigation, prior to standardization of dosage

Dosage

Although the oral dose of niacin may be as high as 300 to 500 mg daily, the average parenteral dose has varied from 40 to 80 mg However, Kurtz *et al* advocated an initial intravenous infusion of 200 cc of 0 05 per cent solution or 100 mg of niacin [9] As the effects decreased or tolerance developed, the strength of concentration was increased to 0 1 per cent A slow drip given over a period of one to three hours was required

The strength of niacin used in this investigation was 0 03 per cent (300 mg niacin dissolved in 1,000 cc of isotonic saline solution) To the niacin solution thus prepared, 1 Gm of procaine hydrochloride and 1 Gm of vitamin C (sodium ascorbate) was added Each cubic centimeter of solution then contained 0 3 mg of niacin, 1 mg of procaine, and 1 mg of vitamin C The prepared solution was administered over a period of twenty minutes by means of a "Flowrator" incorporated into an intravenous infusion setup The "procaine unit" was used to calculate the amount of procaine hydrochloride to be administered, for example, a 70-Kg man would receive 280 mg of procaine and vitamin C and 84 mg of niacin dissolved in 280 cc of isotonic saline in twenty minutes [1]

* Niacin used was the product "Nicamin" generously donated by the Abbott Laboratories.

Clinical Data

All patients developed flushing and a sensation of increased warmth which began in the face and descended down the chest, trunk, and extremities No adverse reactions during the course of the infusion could be detected, and only one patient complained of nausea three hours after the infusion Repetition of the infusion in this case produced the same complaint, although subsequent infusions with only procaine hydrochloride had no similar disturbing side-effects

The types of cases, number of patients, and number of infusions given in each category are listed in Table 1

TABLE 1 —CLINICAL DATA

Classification	Number of Cases	Number of Infusions
Traumatic	14	19
Herniated intervertebral disk	1	2
Fracture	6	6
Arthralgia	4	5
Causalgia	1	1
Myofasciitis	3	5
Degenerative Diseases	18	48
Osteoarthritis	18	48
Inflammatory	7	37
Rheumatoid arthritis	5	34
Neuritides	1	2
Peripheral vascular disease	1	1
Miscellaneous	8	38
Paralysis agitans	4	20
Congenital spastics	4	18
Total	47	142

Traumatic —The analgetic effect of niacin-procaine hydrochloride administered intravenously was little or no different from that obtained by the use of procaine alone, namely, relief of pain [2]

One case of fracture not included in this series was given niacin alone An interesting phenomenon was noted The niacin flush distal to the site of fracture was much less than the flush noted on the opposite extremity, indicative of vasospasm When procaine hydrochloride was administered, the flush increased in intensity

Inflammatory and Degenerative Diseases —The arthritides seemed to benefit more by the combined therapy as evinced by greater relief of pain, increased mobility, and an improved sense of well-being

Miscellaneous —In this group, the case of paralysis agitans showed greater relaxation from

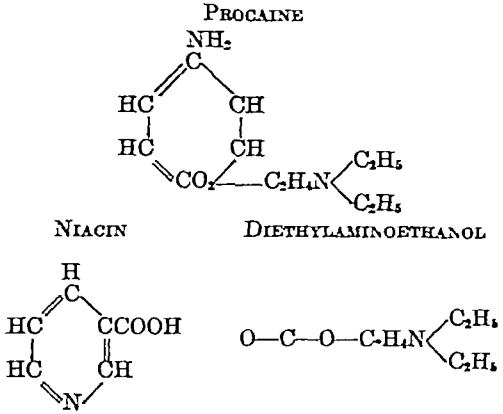

FIG 1 Comparison of chemical structures of procaine, niacin, and diethylaminoethanol

niacin-procain hydrochloride than from procaine alone The congenital spastics, however, found little or no difference

Discussion

The site of vasodilator effect of niacin has been a matter of controversy, but there is uniformity of opinion that the capillary is primarily involved Observation in the one case of fracture suggests that the action of niacin is depressed in the presence of arterial spasm Smith *et al* has demonstrated that in acute poliomyelitis vasospasm is a predominant factor He has found that when these cases are given niacin, little or no change is found in the affected extremities as compared to apparently normal extremities [11]

Comparison of niacin and procaine structurally suggested that a combination of niacin and diethylaminoethanol might prove beneficial (Fig 1) Five-tenths gram of niacin and diethylaminoethanol each were added to 1,000 cc of isotonic saline Six patients given this solution showed no effect except for flushing Analgesia was not found [12]

Conclusion

1 Niacin in combination with procaine hydrochloride may be administered intravenously

2 In the arthritides there is a suggestion of increased benefit Further observations are warranted

3 The use of niacin and procaine hydrochloride in the diagnosis of vasospasm is worthy of further clinical investigation

TIME WAS—

In looking through some old Albany newspapers of the year 1798 I ran across this advertisement emblazoned on the front page with the doctor's name in Capitals at the top

DOCTOR ROBINSON

Lately from the Spanish dominions who has travelled through most parts of Europe and All the West Indies, has rented part of Mr Henry Henderson's house in Pine Street, three doors above the Roman chapel

He cures the Dropsy, Palsy, Flux and Disorders of the Eyes, White Swellings, Ulcers, Burns, Old Sores of ever so long standing, Cancers, Worms, Warts, Kings Evils, bites of poisonous animals and insects, Fever and Ague, blind and bleeding Piles, Gravel and Stone, Jaundice and Venereal Diseases of ever so long standing

Those persons who are afflicted with such disorders and please to apply to him shall have every attention paid to them in his power Dr Robinson flatters himself that what he advertises he is capable of performing

He has pills for sale They cure pains in the Head, Breast, Cholic, Nervous Diseases, restore lost appetite and are valuable for women that are pregnant.

He likewise sets Teeth.—*Contributed by John Hall Blackburn, Albany, New York*

CARDIAC NEUROSIS

ROBERT SEIDENBERG, M D , Syracuse, New York

(From the Department of Psychiatry, Syracuse University College of Medicine)

THE heart as an organ holds a place of importance to the human race second to no other—perhaps, because it is the only organ which so easily makes its presence felt It pulsates, has rhythm, and changes pace in reaction to environmental situations It is constantly active and is often regarded as something alive within our own body, the movements of which are easily detectable by the person in which it resides And the individual soon learns that if the heart does not live, neither does he No other organ of the body has a comparable position in the human mind The liver, the kidneys, equally vital organs, make themselves felt only in severe dysfunction.

Our language reflects the importance of the heart in everyday living We speak of "the heart of the matter" The most important area is referred to as "the heart of the city" An acute observer is said to have his hand on "the pulse of the nation."

Likewise, in language we move the heart around the body with great agility according to our mood. So, "the heart is in the mouth" when we are fearful, "in our boots" when depressed. We are light hearted or heavy hearted To show sincerity, it comes "from the heart" It is needless to cite the examples relating the heart to love and romance A recent popular ballad becomes very psychiatric in its words, "my heart will lose its mind" if the lover becomes unkind

It is, therefore, not at all surprising that the heart becomes the bank of choice in which the neurotic invests his emotional energy And it must be remembered that the candidate for a neurotic disorder referable to the heart is primarily a neurotic Therefore, the term cardiac neurosis is, in a large sense, a misnomer The neurosis is a disorder of the personality, not the heart The cardiac neurotic (using the term with the above qualifications) is a large problem in the practice of medicine Cardiologists of prominence tell us that a great share of their time is spent in telling patients that there is nothing wrong with their hearts

On the other hand, many lay the blame for the neurosis on the medical profession. Lewis speaks of iatrogenous causes of cardiac neurosis, i.e , inept medical examinations and careless suggestions and gestures on the part of the physicians [1] Of course, the inept examination cannot be condoned in any situation, but it is not entirely fair to put the blame on the already overblamed medical profession. The physician may be the innocent accomplice who left the bell of the stethoscope on the precordium a few seconds too long or unwittingly mentioned the murmur which no one should worry about Yet, a knowledge of the personality of the individual who comes with heart complaints can facilitate the diagnosis and prevent further fixation on an already overburdened organ.

The personality of the cardiac neurotic differs from that of the patient with organic heart disease as studied by Dunbar [2] The latter group will not be the concern of this paper Elucidation of the purely emotional disorders will be discussed Study of personality becomes doubly important in differential diagnosis, since, as found by Caughey, functional (emotional) and organic disorders of the heart have similar symptomatology [3] The cardiac neurotic usually exposed to cardiac symptoms in the family learns well

It becomes apparent to the practitioner exposed to this problem that the cardiac neurotic's interests gradually narrow down to his own body, to the exclusion of almost everything else If we may speak of narcissism, the cardiac neurotic in self-love is surpassed by no character in Greek mythology No cardiac or vascular irregularity, change in color, pain, or discomfort goes unnoticed. The palpitation against the mattress at night is often calamitous Nothing is lifted with the left arm for fear of putting strain on the heart The patient must not sleep of his left side for fear of doing damage Light household tasks must be delegated to other members of the family in order to prevent exertion. Noises must be eliminated because of their excitatory effect. The whole life of the individual and the household surrounding him must be regulated, literally to the beat of the heart The phenomenon of what the author calls the cardiac paradox is also present That is, events and circumstances which are pleasureful (for the patient) cause no discomfort, whereas distasteful or boring situations never fail to produce deleterious effects. Other paradoxic situations will be noted in the following case presentation

Case Report

The writer has under treatment an individual who exemplifies these character and neurotic traits

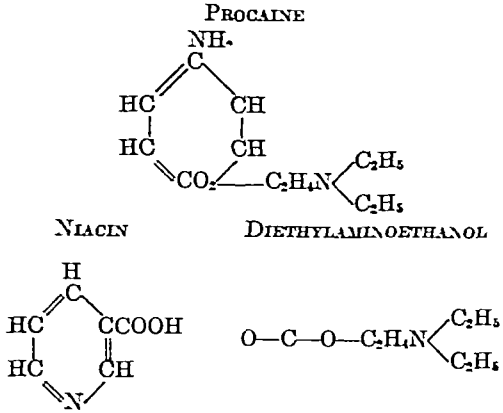

FIG 1 Comparison of chemical structures of procaine, niacin, and diethylaminoethanol

niacin-procain hydrochloride than from procaine alone The congenital spastics, however, found little or no difference

Discussion

The site of vasodilator effect of niacin has been a matter of controversy, but there is uniformity of opinion that the capillary is primarily involved Observation in the one case of fracture suggests that the action of niacin is depressed in the presence of arterial spasm Smith *et al* has demonstrated that in acute poliomyelitis vasospasm is a predominant factor He has found that when these cases are given niacin, little or no change is found in the affected extremities as compared to apparently normal extremities [11]

Comparison of niacin and procaine structurally suggested that a combination of niacin and diethylaminoethanol might prove beneficial (Fig 1) Five-tenths gram of niacin and diethylaminoethanol each were added to 1,000 cc of isotonic saline Six patients given this solution showed no effect except for flushing Analgesia was not found [12]

Conclusion

1 Niacin in combination with procaine hydrochloride may be administered intravenously

2 In the arthritides there is a suggestion of increased benefit Further observations are warranted

3 The use of niacin and procaine hydrochloride in the diagnosis of vasospasm is worthy of further clinical investigation

TIME WAS—

In looking through some old Albany newspapers of the year 1798 I ran across this advertisement emblazoned on the front page with the doctor's name in Capitals at the top

DOCTOR ROBINSON

Lately from the Spanish dominions who has travelled through most parts of Europe and All the West Indies, has rented part of Mr Henry Henderson's house in Pine Street, three doors above the Roman chapel

He cures the Dropsy, Palsy, Flux and Disorders of the Eyes, White Swellings, Ulcers, Burns, Old Sores of ever so long standing, Cancers, Worms, Warts, Kings Evils, bites of poisonous animals and insects, Fever and Ague, blind and bleeding Piles, Gravel and Stone, Jaundice and Venereal Diseases of ever so long standing

Those persons who are afflicted with such disorders and please to apply to him shall have every attention paid to them in his power Dr Robinson flatters himself that what he advertises he is capable of performing

He has pills for sale They cure pains in the Head, Breast, Cholic, Nervous Diseases, restore lost appetite and are valuable for women that are pregnant.

He likewise sets Teeth.—*Contributed by John Hall Blackburn, Albany, New York*

CARDIAC NEUROSIS

ROBERT SEIDENBERG, M D , Syracuse, New York

(From the Department of Psychiatry, Syracuse University College of Medicine)

THE heart as an organ holds a place of importance to the human race second to no other—perhaps, because it is the only organ which so easily makes its presence felt It pulsates, has rhythm, and changes pace in reaction to environmental situations It is constantly active and is often regarded as something alive within our own body, the movements of which are easily detectable by the person in which it resides And the individual soon learns that if the heart does not live, neither does he No other organ of the body has a comparable position in the human mind The liver, the kidneys, equally vital organs, make themselves felt only in severe dysfunction.

Our language reflects the importance of the heart in everyday living We speak of "the heart of the matter" The most important area is referred to as "the heart of the city" An acute observer is said to have his hand on "the pulse of the nation"

Likewise, in language we move the heart around the body with great agility according to our mood So, "the heart is in the mouth" when we are fearful, "in our boots" when depressed We are light hearted or heavy hearted To show sincerity, it comes "from the heart" It is needless to cite the examples relating the heart to love and romance A recent popular ballad becomes very psychiatric in its words, "my heart will lose its mind" if the lover becomes unkind

It is, therefore, not at all surprising that the heart becomes the bank of choice in which the neurotic invests his emotional energy And it must be remembered that the candidate for a neurotic disorder referable to the heart is primarily a neurotic Therefore, the term cardiac neurosis is, in a large sense, a misnomer The neurosis is a disorder of the personality, not the heart The cardiac neurotic (using the term with the above qualifications) is a large problem in the practice of medicine Cardiologists of prominence tell us that a great share of their time is spent in telling patients that there is nothing wrong with their hearts

On the other hand, many lay the blame for the neurosis on the medical profession. Lewis speaks of iatrogenous causes of cardiac neurosis, i e, inept medical examinations and careless suggestions and gestures on the part of the physicians [1] Of course, the inept examination cannot be condoned in any situation, but it is not entirely fair to put the blame on the already overblamed medical profession The physician may be the innocent accomplice who left the bell of the stethoscope on the precordium a few seconds too long or unwittingly mentioned the murmur which no one should worry about Yet, a knowledge of the personality of the individual who comes with heart complaints can facilitate the diagnosis and prevent further fixation on an already overburdened organ.

The personality of the cardiac neurotic differs from that of the patient with organic heart disease as studied by Dunbar [2] The latter group will not be the concern of this paper Elucidation of the purely emotional disorders will be discussed Study of personality becomes doubly important in differential diagnosis, since, as found by Caughey, functional (emotional) and organic disorders of the heart have similar symptomatology [3] The cardiac neurotic usually exposed to cardiac symptoms in the family learns well

It becomes apparent to the practitioner exposed to this problem that the cardiac neurotic's interests gradually narrow down to his own body, to the exclusion of almost everything else If we may speak of narcissism, the cardiac neurotic in self-love is surpassed by no character in Greek mythology No cardiac or vascular irregularity, change in color, pain, or discomfort goes unnoticed The palpitation against the mattress at night is often calamitous Nothing is lifted with the left arm for fear of putting strain on the heart The patient must not sleep of his left side for fear of doing damage Light household tasks must be delegated to other members of the family in order to prevent exertion. Noises must be eliminated because of their excitatory effect The whole life of the individual and the household surrounding him must be regulated, literally to the beat of the heart The phenomenon of what the author calls the cardiac paradox is also present That is, events and circumstances which are pleasureful (for the patient) cause no discomfort, whereas distasteful or boring situations never fail to produce deleterious effects Other paradoxic situations will be noted in the following case presentation

Case Report

The writer has under treatment an individual who exemplifies these character and neurotic traits

He is a married, twenty-nine-year-old World War II veteran (not service-connected) who was referred for psychotherapy because of pain in the left chest, palpitations, and shortness of breath of three years' duration Repeated extensive cardiac examinations, including electrocardiography, revealed no abnormality Reassurance given by prominent physicians gave only temporary comfort The patient was convinced that he had a severe heart disorder which would shortly lead to his death

Psychiatric examination revealed many neuropathic traits in his childhood His father, an alcoholic, served as a severe disrupting factor in the family In spite of the father's cruelty to the wife and children, the son in question was particularly close to the father He often found himself in the position of defending the father against the mother and other children When the son was twenty-one, the father died of an acute heart attack just one day after a physical examination which gave him a clean bill of health After this sudden death, the son had episodes of anxiety but not of an incapacitating nature That year he was drafted into the Army and made a fair adjustment

His cardiac symptomatology came after a physical examination prior to possible transfer to officer's training school During the examination, the medical officer appeared to linger on the cardiac area, whispered to a colleague, and then rejected the candidate for O C S training It was at this point the patient first suspected that it must be heart trouble

The patient was discharged on points in 1945 By this time, symptoms were becoming well established with fear of impending death. He made the rounds of local physicians and, as mentioned above, gained only temporary relief from reassurance, seeming somewhat disappointed and apprehensive with the "clean bill of health" given him Death was most certainly imminent He could recall the conditions of his father's untimely death Nightly, he perused the medical column of the newspaper as assiduously as he read the obituary column wherein could be found many instances of cardiac deaths in young people

As he presented himself for psychiatric treatment, the cardiac paradox was evident He would do no lifting on his job, yet he would bowl an entire evening with his team, averaging 160, with no ill-effects In the company of his friends, he suffered no symptoms, in tedious or boring conversation, he suffered cardiac pain He feared that he might die young, yet when attending a funeral, he phantasized his wife in the coffin. And to top it all, instead of expressing concern about provision for his family after his certain demise, he instead worried how he would manage with his illness if his wife and child were to die!

The ramifications and corollaries to the mechanism of identification with the father who died of heart disease need not be explained here Suffice it to say that a neurotic individual became a cardiac neurotic as a result of an unresolved conflict. His symptoms are not those of conversion hysteria but are more in the nature of an obsession with the concomitant flowering of narcissism. The world and the people in it (including well-meaning physicians) became pawns in the unquenchable desire to succor the body

Discussion

A survey of the personality of such a patient will help the practitioner make a diagnosis without extensive physical investigation and will likewise be of great aid in management Slight fluctuations in blood pressure, extrasystoles, and the grade one murmur are meat for the neurotic The physician often feels that it is his duty to report to the patient each such change, otherwise, his acumen might be questioned when the "abnormality" is dramatically discovered by another physician This reasoning is, of course, fallacious By so doing, the overscrupulous physician unwittingly plays into the hands of the neurotic, for now he has given the patient a thread of substantiation, even though the physician has reassured him that the murmur or extrasystole "is nothing to worry about"

The danger of further introjection of psychic energy into the soma is great In these cases, repeated physical treatment and examinations are not only ineffectual but are definitely harmful Psychotherapy, although not curative in many cases, may enable the patient to gain insight into the illness of his personality and prevent further regression

BIRTHS REMAIN HIGH IN 1948

The second largest number of births in the history of this country occurred during 1948, according to the National Office of Vital Statistics of the Public Health Service The number of live births registered during 1948 was estimated at 3,559,000 or only about 4 per cent below the all-time high of 3,699,940 for 1947 Of even greater significance are the figures which take into consideration the unregistered births The total number of births (registered and unregistered combined) was estimated at 3,715,000 for 1948 and 3,876,000 for 1947 Only eight years earlier, in 1940, the last prewar year, the figure was little more than 2½ million (2,558,000)

The 1948 estimated birth rate of 24 4 per 1,000 population was about 5 per cent below the final rate of 25 8 for 1947, but exceeded the 1946 rate (23 3) by almost 5 per cent (These rates and all other figures which follow are based on registered births.) In New York State there were 323,250 live births in 1947 as compared to 196,088 in 1940, an increase of 56 2 per cent per 1,000 population

A GASTROSTOMY TECHNIC ADAPTED TO THE CONTRACTED STOMACH

SAMUEL LEO, M D , F A C S , New York City

(From the New York City Cancer Institute)

THE purpose of this paper is to present briefly an improved method of tubovalvular gastrostomy adapted to the contracted stomach. A more comprehensive report will be made at a later date

In the Gastro-Intestinal Division of the Surgical Service of the New York City Cancer Institute, where gastrostomies are frequently performed, the need for a more satisfactory technic has been recognized. Patients with carcinoma of the esophagus in an advanced stage are transferred here from the many hospitals of greater New York The nutrition of these patients is extremely poor, and in some of them the esophageal lesion has progressed to the point of complete obstruction The problem of feeding these patients is a serious one, especially where the limits of parenteral feeding have been reached In order to maintain life, an immediate gastrostomy becomes imperative

At operation, we find a stomach contracted in all its axes, particularly in the transverse This narrowing in the transverse axis compels us to abandon procedures such as Stamm, Witzel DePage, Janeway, and modifications thereof, which utilized only the anterior surface of the stomach Because the diminished surface of the anterior gastric wall does not lend itself to the performance of a satisfactory gastrostomy, the foregoing methods were inadequate Methods employing both the anterior and posterior gastric walls, such as Beck-Carrel described in 1905 and Jianu described in 1912, were likewise inadequate because of the diminution in both the transverse and longitudinal axes

As the progress which resulted in the present technic of esophagectomy and esophagogastrostomy was made in the various clinics, certain fundamental facts became evident

1 That it is necessary to sever the attachments of the lesser and greater curvatures of the stomach from its ligaments in order to obtain mobilization With the division of these ligaments, the circulation to the stomach had to be interrupted, thus reducing the normal blood supply to the stomach.

2 That when the inferior thyroid and right gastric arteries are preserved in this type of surgery, other vessels to the esophagus and stomach may be sacrificed with no adverse effect on the nutrition of these two organs

The technic described below has been clinically tested and represents a procedure having as its basis the knowledge thus acquired. A segment of the greater curvature of the stomach is completely liberated, making available both the anterior and posterior walls of the stomach for the creation of a plastic, mucus-lined tube When completed, a "valve" is formed which prevents the escape of gastric contents on the surface of the abdomen Thus, the following objectives are achieved (1) the prevention of local tissue damage, (2) the diminution of secondary infection, and (3) the conservation of fluid and nutriment so vital to these malnourished patients

Technic

Through a left upper midrectus incision, a segment of the greater curvature is liberated by dividing the gastrocolic ligament between clamps (Figs 1, 2) The tissue in each clamp is suture ligatured with number 0 plain catgut

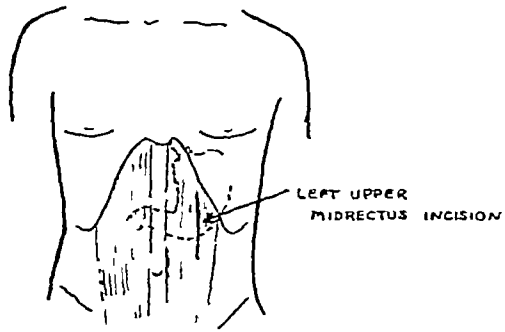

FIG 1 Site of incision

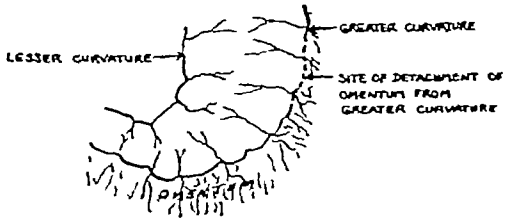

FIG 2 Site of detaching omentum from stomach.

Presented at a meeting of the Bronx Surgical Society November 22 1948

A GASTROSTOMY TECHNIC ADAPTED TO THE CONTRACTED STOMACH

SAMUEL LEO, M D , F A C S , New York City

(From the New York City Cancer Institute)

THE purpose of this paper is to present briefly an improved method of tubovalvular gastrostomy adapted to the contracted stomach A more comprehensive report will be made at a later date

In the Gastro-Intestinal Division of the Surgical Service of the New York City Cancer Institute, where gastrostomies are frequently performed, the need for a more satisfactory technic has been recognized Patients with carcinoma of the esophagus in an advanced stage are transferred here from the many hospitals of greater New York The nutrition of these patients is extremely poor, and in some of them the esophageal lesion has progressed to the point of complete obstruction The problem of feeding these patients is a serious one, especially where the limits of parenteral feeding have been reached In order to maintain life, an immediate gastrostomy becomes imperative

At operation, we find a stomach contracted in all its axes, particularly in the transverse This narrowing in the transverse axis compels us to abandon procedures such as Stamm, Witzel, DePage, Janeway, and modifications thereof, which utilized only the anterior surface of the stomach. Because the diminished surface of the anterior gastric wall does not lend itself to the performance of a satisfactory gastrostomy, the foregoing methods were inadequate Methods employing both the anterior and posterior gastric walls, such as Beck-Carrel described in 1905 and Jianu described in 1912, were likewise inadequate because of the diminution in both the transverse and longitudinal axes

As the progress which resulted in the present technic of esophagectomy and esophagogastrostomy was made in the various clinics, certain fundamental facts became evident

1 That it is necessary to sever the attachments of the lesser and greater curvatures of the stomach from its ligaments in order to obtain mobilization With the division of these ligaments, the circulation to the stomach had to be interrupted, thus reducing the normal blood supply to the stomach

2 That when the inferior thyroid and right gastric arteries are preserved in this type of surgery, other vessels to the esophagus and stomach may be sacrificed with no adverse effect on the nutrition of these two organs

The technic described below has been clinically tested and represents a procedure having as its basis the knowledge thus acquired A segment of the greater curvature of the stomach is completely liberated, making available both the anterior and posterior walls of the stomach for the creation of a plastic, mucus-lined tube When completed, a "valve" is formed which prevents the escape of gastric contents on the surface of the abdomen Thus, the following objectives are achieved (1) the prevention of local tissue damage, (2) the diminution of secondary infection, and (3) the conservation of fluid and nutriment so vital to these malnourished patients

Technic

Through a left upper midrectus incision, a segment of the greater curvature is liberated by dividing the gastrocolic ligament between clamps (Figs 1, 2) The tissue in each clamp is suture ligatured with number 0 plain catgut

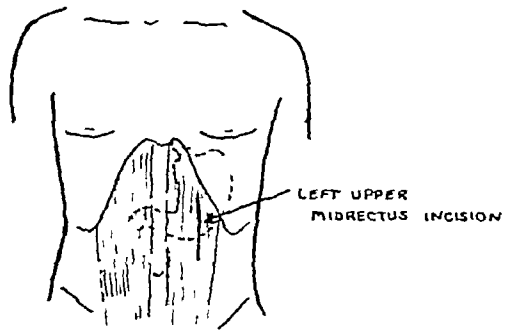

FIG 1 Site of incision

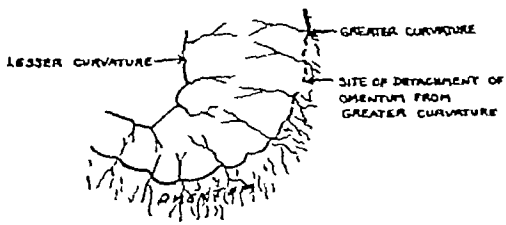

FIG 2 Site of detaching omentum from stomach.

Presented at a meeting of the Bronx Surgical Society November 22 1948.

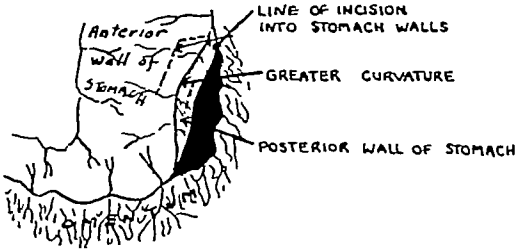

FIG 3 Greater curvature separated from the omentum—L-shaped incision into both walls.

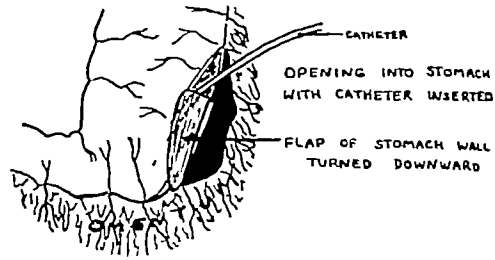

FIG 4 Opening into stomach at greater curvature with catheter inserted and flap turned down.

The length of the greater curvature so liberated should be 6 5 cm or greater, depending on the desired length of the gastric tube to be created This length will vary with the thickness of the abdominal wall through which the tube is to pass Attention is here directed to the necessity of identifying and preserving the middle colic artery

The stomach is then delivered An incision is made in the transverse axis from the proximal end of the liberated greater curvature, cutting through both the anterior and posterior walls, a distance of 2 5 cm The incision is further extended at right angles distally in the longitudinal axis, through the anterior and posterior walls of the stomach to the level of the distal limit of the liberated greater curvature When complete, the incision on the anterior gastric surface will resemble an inverted "L" (Fig 3) At this stage, the portion of the stomach to be used for the construction of the tube measures 5 cm in its transverse axis, of which 2 5 cm represents the anterior surface and 2 5 cm the posterior surface The long axis measures 6 5 cm The distally placed base is the only attachment to the body of the stomach

Hemostasis is obtained by carefully ligating the vessels in the gastric wall with fine plain catgut The stomach is emptied of its contents by suction and sponge swabs No intestinal clamps are used

The mucosa is approximated, starting at the midpoint of the proximal end, with a continuous atraumatic catgut suture, locking every other stitch until the base of the flap is reached. The suture is then continued in the same direction, approximating the sides of the flap, thus forming a tube into the opening of which a number 18 French catheter may be readily inserted (Figs. 4, 5) In a similar fashion, the serosa is approximated with a continuous linen suture, locking every other stitch (Fig 6) The catheter is now inserted through the tube into the stomach

The freed gastrocolic ligament is reattached to the newly formed greater curvature with interrupted plain number 0 catgut

The gastric tube is now brought to the upper angle of the incision and is fixed by suturing the parietal peritoneum to the gastric serosa adjacent to the base of the newly created tube. Interrupted atraumatic chromic catgut sutures are used

The peritoneum is closed with interrupted number 0 chromic catgut, the muscle with number 0 plain catgut, and the skin with number 00 silk The protruding gastric tube, measuring 1 cm, is protected with vaseline gauze The wound is dressed with dry gauze

Tables 1 and 2 show the postoperative dietary routine

Comment

With this procedure complete, we have created a plastic, mucus-lined tube to which both the anterior and posterior surfaces of the stomach

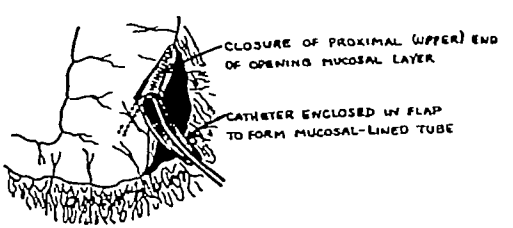

FIG 5 Closure of opening in stomach and flap to form mucosal-lined tube

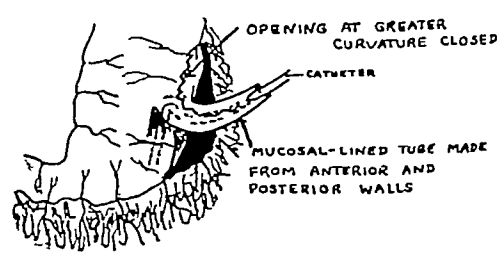

FIG 6 Closure completed with serosal suture with catheter in tube and stomach.

TABLE 1.—POSTOPERATIVE DIETARY ROUTINE*

First day
500 cc whole blood transfusion
1 000 cc. parenamine infusion
1,000 cc 5% glucose in saline—infusion
500 cc glucose in distilled water—infusion

Second day
Same as first day Omit blood

Third day
1,500 cc. 5% glucose in saline—infusion
1,000 cc. albumin water—tube feeding
Vitamins—same as first day

Fourth day
Dilute orange juice—1 part in 5 parts water—total 500 cc
1 000 cc albumin water
250 cc beer
Milk—1 part water to 3 parts milk—total 1 500 cc
Vitamins—same as first day

Fifth day
Orange juice—see above
Beer—500 cc.
Milk—in form of eggnog—250 cc
Albumin water—1 000 cc.
Vitamins—same as first day

Sixth day
1/2 of formula (see Table 2)
1 500 cc albumin water
500 cc. beer
Vitamins—same as first day

Seventh day
1/2 of formula (see Table 2)
500 cc. beer—divided into noon and evening feedings
Vitamins—same as first day

Eighth day
1/2 of formula (see Table 2)
500 cc beer—divided into noon and evening feedings
Vitamins—same as first day

Ninth day
Full formula—divided into 3 feedings (morning, noon, and evening)—given by drip method through tube
Beer—500 cc —divided into noon and evening feedings
Vitamins—same as first day

Adjuncts to diet**
Vitamin B nicotinic acid—25 mg.
Riboflavin—5 mg
Thiamin chloride—15 mg
Vitamin C—100 mg.

* Formulated with the cooperation of Miss Julia Coluzzi dietitian, New York City Cancer Institute

** Vitamins administered parentally until tube alimentation is completely established on the ninth day

have contributed This tube protrudes 1 cm beyond the surface of the abdominal incision. The previously intubated catheter may be dispensed with at the end of about ten days The gravity method of feeding is then continued by direct introduction of the food into the gastric tube

The physiologic advantages of this operation are (1) an undisturbed gastrointestinal continuity, (2) a tube in a position suggesting the side arm of a Chapman Water Pump, and (3) an intestinal peristaltic gradient which tends to create a negative pressure in the tube Hence, any fluid reposing in or introduced into this newly created tube would be drawn into the stomach by suction

Summary

The need for a tubovalvular gastrostomy adapted to the contracted stomach has long been felt As has been noted, existing methods to date have not been suitable With the advances made in esophageal and gastric surgery, we have learned that liberation of the greater curvature of the stomach from the gastrocolic ligament and its blood supply was feasible and safe This fact served as the basis for the technic described, which resulted in the formation of a mucus-lined tube with the following advantages (1) prevention of leakage, (2) diminution in the incidence of infection, and (3) conservation of vital fluids and nutriment

Case Reports

SUBEPICRANIAL HYDROMA (FALSE MENINGOCELE)

NATHANIEL H SOLOMON, M D , Forest Hills, New York

(*From the Department of Pediatrics, Beth Israel Hospital*)

THE ESCAPE of cerebrospinal fluid through the ear or nose complicating skull fractures is fairly common, and its significance is usually recognized Less frequent and rarely reported is the accumulation of cerebrospinal fluid beneath the scalp aponeurosis seeping from the subarachnoid space through torn meninges and fractured skull

Since the first report by Billroth, there have been about eighty publications, mostly individual case studies, describing this condition [1,2] That this phenomenon may not be so rare as the paucity of literature on this subject seems to indicate was suggested by Bozsan and Brennan who observed 29 such cases in a ten-year period at two New York City hospitals [3] They believe that the escape of spinal fluid occurs more frequently and that cases are either overlooked or are erroneously diagnosed as "hematoma of the scalp "

Most of the cases observed heretofore (and the case to be reported) occurred in children and followed a blunt injury to the head Since children are usually first seen by the family physician or pediatrician, it is hoped that this case report will lead to increased recognition and proper treatment of this condition

Case Report

N T , a two-and-one-half-year-old girl, fell down a flight of stairs at approximately 4 00 P M on December 30, 1947 Her grandmother, who witnessed the accident, stated that the child's head struck the side of a metal chair at the foot of the stairs The child appeared pale and cried loudly She did not lose consciousness A local physician, who examined the child at this time, told the parents that the injury was superficial and prescribed bed rest

Five hours after the injury a temperature of 104 F was noted The next morning the child was first seen by this observer The child had slept quietly There were no convulsions, delerium, drowsiness, or vomiting She complained of pain in the abdomen and head Temperature at this time was 102 F

Past history was as follows At one year of age congenital dislocation of hips was diagnosed, and the child was treated for the following year by means of plaster cast and braces The child also had frequent diarrheal episodes from about three months to about eighteen months of age

Physical examination revealed an acutely ill child with flushed face and good color She was alert and keenly aware of her environment No twitchings or tremors were noted. Pharynx and tonsils were injected Right catarrhal otitis media was present. Lungs were clear Pulse rate was 100 No cardiac enlargement or murmurs were noted. Abdomen was slightly distended, no masses, tenderness, or rigidity were noted There was no dullness on percussion of the flanks Extremities were not remarkable

Neurologic examination showed the pupils to be round, equal, and reacting well to light and accommodation Reflexes were equal and active throughout. No pathologic reflexes were noted Over the left parietal eminence there was a soft, fluctuant, somewhat tender swelling about 3 inches (7 5 cm.) in diameter, and about 1 inch (2 5 cm) in depth There was no discoloration of the scalp

Penicillin in oil and wax (200,000 units intramuscularly) was administered, followed by oral penicillin, 50,000 units every four hours Neosynephrine nose drops, 1/4 per cent, were also prescribed In the following three days the child seemed to improve on this regime The temperature fluctuated between 100 and 101 F The abdominal and head pain receded The child ate well and appeared cheerful and bright

On the morning of January 3, 1948, the child developed marked swelling of the left upper and lower eyelids Examination at this time revealed that the previously noted scalp swelling now extended over the entire left side of the scalp The left side of the forehead was enlarged when compared with the right side The eyeball was neither injected nor proptosed, and the lid swelling was continuous with the aforementioned scalp swelling Temperature was 102 F The signs of respiratory infection had receded Neurologic examination was unchanged except for an abnormal left plantar response

The child was then hospitalized at Beth Israel Hospital. X-ray of skull was interpreted by the x-ray department as showing "the grooves for the vessels to be quite deep, simulating a fracture, but no fracture was definitely demonstrated" (Fig 1) It may be said, however, that Dr Sidney W Gross, the neurosurgical consultant, interpreted the films as indicative of fracture He examined the patient and diagnosed the scalp swelling as escaped cerebrospinal fluid He advised continuance of the penicillin and further observation of the swelling with no aspiration of the scalp swelling

The blood count showed 4,230,000 red blood cells, 14,200 white blood cells, 11 Gm hemoglobin, with a normal differential count. Urine was negative

The next morning (five days after the injury), in addition to the previously noted swelling, the right eyelid was also swollen. However, from this point

FIG 1 X-ray of skull showing probable fracture line.

on, the swelling diminished On the next day the eyelids were no longer swollen, but the scalp swelling remained essentially unchanged for the remainder of her seven-day hospital stay (Fig 2) On the fourth hospital day the child developed diarrhea which responded quickly to dietary measures She was discharged on January 10 (twelve days after her injury) At home the scalp swelling receded quickly and disappeared completely on January 14 (sixteen days after her injury) When examined two months later, she showed no complications or sequelae

Anatomy and Nomenclature

The scalp swelling caused by the escape of cerebrospinal fluid through the torn meninges and fractured skull has heretofore been referred to as false or spurious meningocele This name is admittedly incorrect and somewhat misleading since the accumulation of cerebrospinal fluid is not lined by meninges, but rather by the musculofibrous layer of the scalp, the epicranius The latter "covers the whole of one side of the vertex of the skull and consists of two parts, the occipitalis and frontalis, connected by an intervening tendinous aponeurosis, the galea aponeurotica"[3]

Mayfield suggested the name of subgalial hydroma, but the escaped fluid accumulates not only under the galea aponeurotica, but also under the occipitalis and the frontalis[4] The fluid occupies the subepicranial space (between the pericranium and epicranius) The name subepicranial hydroma is, therefore, suggested for this condition

In children the dura mater very intimately approximates the skull Thus, if the latter is fractured, the dura is very apt to be torn also If, in addition, the arachnoid is also torn, then cerebrospinal fluid will escape extracranially

Clinical Characteristics

Subepicranial hydroma may appear immediately following the accident, or it may first be noted several days later In the latter event it is presumed that the channel from the subarachnoid space

FIG 2 Patient, N T, six days after injury, showing swelling of left side of scalp covered by normal skin

to the scalp is incomplete immediately following the accident and that either increased absorption in the region of the fracture or increased physical activity of the patient may effect an escape of cerebrospinal fluid into the scalp

The swelling usually increases slowly The skin overlying the swelling is unchanged and never undergoes any of the color changes associated with contusions The swelling is loosely fluctuant and has been aptly likened to a partly filled hot water bag It transilluminates well Palpation of the swelling is surprisingly painless

At the base of the swelling one can often palpate a circular rim which must be differentiated from a depressed fracture Subepicranial hydroma, once it starts to recede, disappears rapidly and is not followed by thickening or fixation of the scalp

X-ray demonstrates that the scalp swelling is smoothly outlined and is of even density throughout (Fig 3)

Diagnosis

The differential diagnosis from hematoma of the scalp can be summarized as follows

	Subepicranial Hydroma		Hematoma of Scalp
1	Skin over swelling normal	1	Edematous skin bruised or discolored
2	Loosely fluctuant	2	Crunching crepitus of coagulated blood
3	Painless	3	Painful
4	Disappears rapidly	4	Disappears slowly
5	Scalp remains normal	5	Scalp remains fixed for a considerable time
6	May appear days after injury	6	Is present soon after injury
7	X-ray Swelling is smoothly outlined and of even density	7	X-ray Swelling is of uneven density and is not well demarcated from surrounding skin

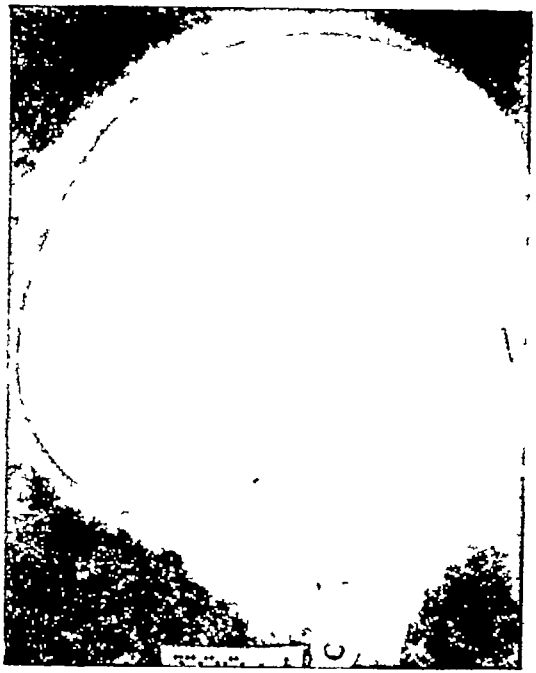

FIG 3 X-ray showing shadow of scalp swelling to be of even density

Treatment

There is almost unanimous agreement that aspiration of the subepicranial hydroma should not be performed either for diagnosis or treatment As previously stated, there are numerous clinical signs which make the diagnosis of this condition fairly certain Furthermore, the swelling subsides so rapidly and completely that a hastening of this process is unnecessary A puncture through intact scalp under sterile precautions may seem like an innocuous procedure, but the literature reveals several infections and resulting fatality as a consequence of aspiration [2] It seems wiser to resist the temptation to procure positive proof In certain unusual circumstances, as pointed out by Mayfield, where a child has a coincident infected scalp abrasion which the spreading subepicranial hydroma is fast approaching, aspiration through clean scalp would help prevent spread to the area of the infected abrasion [4]

Summary

1 A case of a fracture of the cranial vault with escape of cerebrospinal fluid into the scalp is reported

2 Subepicranial hydroma is suggested as an appropriate name for the scalp swelling

3 This condition occurs most frequently in children

4 The clinical characteristics of subepicranial hydroma are described, and the differential diagnosis from scalp hematoma is indicated

5 Routine aspiration of the fluid for either diagnosis or treatment is not recommended

62-65 SAUNDERS STREET

I wish to thank Dr Sidney W Gross and Dr Philip Cohen for their helpful suggestions in the preparation of this article

TUBERCULOSIS PATIENTS INCREASE COSTS

Tuberculosis patients who leave hospitals against medical advice and before treatment is completed cost the City of New York more than $11,000,000 annually, or more than enough to build a 500-bed hospital each year, according to a statement issued by Dr Herbert R Edwards, executive director of the New York Tuberculosis and Health Association, 386 Fourth Avenue Dr Edwards said that this was based on the Drolet-Porter Report on an average year, 1947, when 2,373 tuberculosis patients in New York City hospitals, both public and private, left against medical advice and before their disease had been arrested He stressed that these "sign outs" are very likely to break down and be returned to the hospital in a much worsened condition "This means," he said, "that long and expensive treatment must be started all over again and very often with much less chance of success"

In addition, Dr Edwards went on, the report reveals that nearly half of the tuberculosis patients who "sign out" are open, infectious cases and thus are focal points for infection for members of their families and the community

Dr Edwards put the cost of caring for a tuberculosis patient at "a very conservative $7 50 per day per patient"—the amount paid by the City to private hospitals for such care On this basis, he said, the figure for the care of this "sign out" group alone reaches $6,531,682 50 per year This sum, he said, is arrived at by taking the average length of hospital stay, as shown by the study to be 367 days, a total for the group of 870,891 hospital days

UNUSUAL SITES OF ENDOMETRIOSIS

JOSEPH MANGIARDI, M.D., Brooklyn, New York

(From St John's Episcopal Hospital)

A REPORT of two rare manifestations of endometriosis is herewith submitted to add to the increasing literature on this interesting condition

Case Reports

Case 1—Miss D F, a twenty-one-year-old Negro woman, was admitted to the hospital on February 26, 1948, complaining of intermittent, painful swelling of the right groin for two months prior to admission The pain was not related to exertion, digestion, or menstruation (as far as could be determined) The swelling consisted of a walnut-sized mass just above the external inguinal ring, which would enlarge during painful episodes and subside during the asymptomatic intervals Exacerbations would last for one or two days and recur at two- to three-week intervals Menses were normal and regular with a twenty-nine day interval. The patient had no other complaint, and examination of past history was negative

Physical examination revealed a well-developed, well-nourished, young woman, not in acute distress A walnut-sized mass was palpable at the external inguinal ring on the right side There was a definite impulse on cough or straining, but the pain could not be reproduced The mass seemed cystic and was not reducible There were no other positive physical findings

The temperature, pulse, respirations, and blood pressure were normal on admission Routine blood count and analysis of the urine were within normal limits

The preoperative diagnosis was hydrocele of the canal of Nuck (right) and indirect right inguinal hernia.

On March 7, 1946, under spinal anesthesia, a right inguinal incision was made, exposing a cystic mass about 1 inch long in the canal of Nuck. This was dissected from the adjacent tissues and was found to be connected with a funicular process of peritoneum, which was still open, communicating with the abdominal cavity The mass and hernia were found lateral to the deep inferior epigastric vessels The sac and cord were both ligated and cut and were excised, together with the attached cystic mass The internal oblique and conjoined tendon were sutured to Poupart's ligament, and the external oblique aponeurosis was closed.

The specimen was examined and thought to be a hydrocele, but, unlike the usual variety, it was reddish-gray, granular, uneven, and resilient When cut, no fluid was liberated Cut surfaces were pink, gray, and red, quite granular and with golden-yellow, oily lobules scattered throughout

Microscopic report was as follows "Several of the particles contain irregular spaces lined by cuboidal and cylindric epithelial cells A few show gland and ductlike structures Lymphocytes and hemosiderin-laden macrophages are scattered through the surrounding connective tissues A few of the spaces contain erythrocytes and occasional hemosiderin-laden macrophages There are a few zones of fibrosis with follicular tissue and fibroblasts scattered throughout the interstices A membranous piece of tissue is composed of collagen fibers admixed with smooth muscle and lobules of adipose tissue It is lined with flattened epithelium on one aspect"

The diagnosis was hernial sac, endometriosis, and remnant of canal of Nuck.

Case 2—Mrs C K., a forty-year-old white woman, was admitted on April 1, 1946, because of irregular menses, metrorrhagia, menorrhagia, and nervousness of one year's duration Menses were often associated with the passage of large clots Symptoms of frequency of urination and a sense of weight in the pelvis were also noted during the month preceding admission The patient had never been pregnant She stated she had a "nervous breakdown" in 1943, also that her left tube and ovary were removed in 1936 for relief of left lower quadrant pain She had never had painful menstruation

Physical examination revealed a well-developed, well-nourished woman not in acute distress The uterus was slightly enlarged, irregular, and nodular No other physical abnormalities were found The blood count, urine, and blood pressure were normal. The impression of the admitting physician was fibroid uterus

Operation was performed on the day after admission Moderate pelvic adhesions were encountered. The left tube and ovary were absent The right ovary was enlarged and contained numerous follicular cysts Multiple subserosal nodules were found in the uterus A subtotal hysterectomy and right salpingo-oophorectomy were performed The uterus was separated from the bladder with difficulty, and, when removed, a lime-sized nodule was palpated in the posterior wall of the bladder No other pelvic pathology was discernible

The pathologic report was as follows "Fibromyomata uteri, endometrium in proliferative phase, follicular cysts of the ovary, segment of fallopian tube"

The patient's postoperative period was uneventful. She was discharged on the seventeenth postoperative day in good condition and without symptoms In view of the nodule in the bladder which was found at operation, cystoscopic examination was performed two weeks later At that time, a lime-sized tumor was visible through the cystoscope on the posterior bladder wall. It was ovoid, smooth, and entirely submucosal The overlying mucosa looked healthy and intact A tentative diagnosis of bladder wall tumor, probably benign, was made, and open operation was advised

The patient was readmitted on July 11, 1946, in good health and without symptoms On July 13, operation was again performed through a right paramedian incision and the bladder opened The tumor was easily visualized and, when palpated, seemed to lie entirely within the muscularis Wide excision was made, removing adjacent normal bladder wall, including a small area of the intraperitoneal portion of the bladder beneath the tumor The bladder was carefully closed with interrupted chromic sutures, passed through the outer coats, and an open-end mushroom catheter was used for drainage This was removed on the sixth postoperative day

Convalescence was rapid, and the patient was

discharged in good condition on the thirteenth postoperative day

Grossly, the tumor consisted of an irregular ovoid mass, the size of a lime, with irregular, reddish, and reddish-gray patches On section, the tissue was fleshlike in consistency, flecked with reddish-gray areas, and marked with white streaks Small collections of brown fluid were found throughout the specimen

Pathologic report revealed the following "The tissue was composed predominantly of smooth muscle bundles arranged in ramifying aggregations Small cysts, tortuous ducts, and glandlike structures are scattered through several areas The glands are lined by cuboidal and cylindric epithelium with rounded, ovoid nuclei, containing basophilic chromatin granules with acidophilic cytoplasm The smaller cysts have cuboidal and cylindric epithelium linings The larger cysts are lined by flattened, atrophic epithelium, portions of which are exfoliated Some of these cysts contain basophilic granular material Others contain granular acidophilic material, occasionally erythrocytes and macrophages The epithelial elements are isomorphic within the average range of variation Basal layers are clearly defined Scattered aggregations of polyblasts are evident in portions of the interstices In some foci, hemosiderin-laden macrophages are conspicuous. One such area is present near adipose and connective tissue which is evident near one margin"

The diagnosis was endometriosis of the bladder

The author wishes to express his appreciation to Drs. Albert Thung and Augustus Harris for permission to publish these interesting case reports and to Dr R Gettinger pathologist

NEW YORK STATE MEDICAL LIBRARY

Doctors of New York State are reminded of the facilities of the State Medical Library at Albany They are invited to visit, telephone, or write to the Library where a trained staff of librarians will take care of their requests

Upon request, a copy of the regulations will be sent, which lists the services of the Library, including the compiling of bibliographies, sending material on specific subjects, or filling requests for definite book or journal references

A collection of over 57,000 books and the receipt of approximately 600 current medical journals enable the Medical Library to offer a real service to the doctors of the State

Letters may be addressed to Miss Maude E Nesbit, Librarian, New York State Medical Library, Education Building, Albany 1, New York

REGIONAL ENTERITIS

CARMEN RAZZANO, M D , Williston Park, New York

(From the Nassau Hospital)

THE FOLLOWING is a report of a case of regional enteritis which was treated with surgery

Case Report

A forty-three-year-old white man was admitted for the first time to the Nassau Hospital, June 2, 1946 Family history was noncontributory The patient had been treated for auricular fibrillation with digitalis in the past but had never undergone surgery

The present illness began forty-eight hours before admission with a sudden onset of severe epigastric pain, followed by two episodes of nausea and vomiting The patient felt weak and cold Because of his past history an electrocardiogram was done twenty-four hours before admission This was negative for coronary artery disease but did show auricular fibrillation In the next twenty-four hours the abdominal pain subsided but did not completely disappear, and the patient gradually developed abdominal distention. No history of dark or bloody stools was obtained Remaining systemic review was negative

Physical examination revealed a well-developed, well-nourished man of about the stated age appearing acutely ill. Lungs were negative Heart was fibrillating. The blood pressure was 140/90 The abdomen showed moderate distention of 1 plus, on a basis of 1 to 4, and definite localized tenderness and spasm to palpation just to left of the umbilicus in the left upper quadrant There was no evidence of hernia Rectal examination was negative. An enema on admission showed little return except for some blood-tinged fluid

Laboratory findings were as follows Urinalysis was negative White blood count, the day before admission, was 30,000, on the day of admission it was 12,900, with 92 per cent polymorphonuclears Hemoglobin was 80 per cent Flat plate of abdomen was negative Temperature was 102 F , pulse 110

On June 3, 1946, the day after admission, the abdomen was explored through a left lower pararectus incision There were about 300 cc of straw-colored fluid in the peritoneal cavity On further exploration about 18 inches of small bowel, starting 1 foot from the ileocecal valve, showed a red, beefy, thickened appearance with several oval, superficial ulcerations at the mesenteric border, ½ to 1 cm in size The mesentery to this segment was edematous and contained a number of enlarged nodes The abdomen was closed in layers without drainage

The postoperative course was uneventful. The patient received 40,000 units of penicillin every three hours and sulfadiazine 1 Gm every four hours for seven days. The patient was discharged on the twelfth postoperative day

On September 11, 1946, approximately two months after the first admission, the patient was readmitted to Nassau Hospital. Symptoms on this occasion consisted of recurrent attacks of abdominal pain for the preceding two weeks, cramplike, intermittent in character, and associated with nausea but no vomiting

Physical examination of the abdomen revealed slight generalized abdominal tenderness without spasm. The previous scar was well healed Upper gastrointestinal series showed stenosis of the small bowel.

The patient was prepared with intravenous therapy and Levine tube with suction The white blood count was 5,750 with 62 per cent polymorphonuclears and 95 per cent hemoglobin Total protein was 5 9 per cent On September 16, 1946, the abdomen was explored through a lower right pararectus incision On opening the peritoneum the stenotic bowel was found about 1 foot from the ileocecal valve Approximately 18 inches of small bowel was involved, the distal third of which was lead pipe in appearance while the proximal two thirds were distended and thickened. The serosal surface was rough and showed both fibrous and fibrinous adhesions. The mesenteric nodes were enlarged and deeply congested. The remaining small and large bowels were normal. Resection of the involved segment of bowel with a wide area of corresponding mesentery and glands was performed, followed by an end-to-end, closed, Parker-Kerr type anastamosis The wound was closed in layers without drainage

The postoperative course was smooth until the fifth postoperative day, when minimal bronchopneumonia developed in the left lung Prompt recovery followed the usual treatment of this condition The patient was discharged on the fourteenth postoperative day Subsequent follow-up, three weeks and two months after discharge, showed the patient to be well and carrying on his normal activities In July, 1948, almost two years postoperatively, the patient was seen and found to be free of recurrence or progression of his disease

Summary

1 Despite increasing reports in literature on regional enteritis, it is still an infrequent lesion, the cause of which remains obscure

2 The acute phase of this disease is usually mistaken for acute appendicitis In this case, a diagnosis of mesenteric thrombosis was entertained, in view of the cardiac status

3 Penicillin and sulfadiazine had no effect in arresting the progress of the disease in this patient A recent review of the literature reveals that the antibiotics are helpful in the acute phase of regional enteritis

4 The common site of regional enteritis is the terminal ileum with progression toward the cecum and the ascending colon. However, no part of the intestinal tract is immune

5 There is practically universal agreement in the literature on the treatment of the acute phase of regional enteritis, i e , conservative therapy following exploration and diagnosis

6 Finally, surgery is the only method of therapy in the chronic obstructive stage, with or without fistula and abscess formation

Special Article

SUGGESTED STUDIES OF POLIOMYELITIS

GILBERT DALLDORF, M D , Albany, New York

(From the Division of Laboratories and Research, New York State Department of Health)

THIS is an interim report to those members of the Medical Society of the State of New York who assisted us last summer in search for further cases of infection with the virus first recovered from two patients with clinical poliomyelitis in 1947 [1,2] The virus differs from the known strains of poliomyelitis virus in being pathogenic for suckling mice but not for rhesus monkeys, and in inducing, in mice, extensive degenerative lesions of the muscles rather than the motor neurons of the central nervous system The role of the agent in relation to poliomyelitis or a disease which only resembles poliomyelitis is not known, and last summer's work was undertaken to learn more about it

The 136 fecal specimens collected during 1948 which have now been examined have yielded ten isolations Three of these were from Broome County, two each from Chautauqua and Greene Counties, and one each from Saratoga, Westchester, and Jefferson Counties In view of the miscellaneous nature of many of the specimens, it seems unwise to draw conclusions from these results other than that infectious agents pathogenic for suckling mice were widely disseminated in New York State during the summer of 1948 Five of the ten strains isolated are apparently similar to the virus first described except for a difference in serologic type The remaining five strains appear to differ and are being studied

The facts we have gathered do not allow us to distinguish these patients' illnesses from poliomyelitis Fever, headache, and spinal rigidity were usually present Gastrointestinal symptoms such as anorexia, nausea, and vomiting were frequent, and sore throat was occasionally noted The upper respiratory and gastrointestinal symptoms often preceded the headache and stiffness of the spine One patient was frankly paralyzed and left the hospital in a wheel chair a month following admission Five others had transient weakness of arm, leg, or back muscles, which disappeared within a matter of hours or days A history of similar illness in other members of the family or contacts was obtained in five cases Cerebrospinal fluid was examined in seven, and all showed an increased number of cells In three, the total count amounted to 200 to 250 cells per cu mm

So far we have found no simpler method of establishing a precise diagnosis than the inoculation of animals, which is slow and tedious and probably not very efficient The existence of antigenically distinct strains promises that serologic diagnosis will also be complicated. Therefore, we have sought other procedures The muscle degeneration suggested a study of the creatine and potassium balances, and it has now been learned that these are greatly altered in the experimental disease Infected mice excrete large amounts of creatine in their urine The concentration rises shortly before the onset of paralysis and frequently amounts to 3 mg per ml of urine by the time signs of infection are manifest The creatine and potassium content of the muscles of paralyzed mice is sharply reduced.

For forty years loss of creatine has been known to occur in poliomyelitis, but attention seems to have been limited to the late atrophic stages which have been compared with various muscle dystrophies.[3-7] Yet Carey and others have reported histologic evidence of muscle necrosis in both early human and experimental monkey poliomyelitis.[8,9] We should not expect, therefore, that creatinuria will distinguish between infection by the classic strains of virus and the new agent unless there proves to be a difference in degree On the other hand, both potassium and creatine studies may provide very useful information The presence or absence of creatinuria in paralyzed patients proved to be infected with the suckling mouse agent would seem significant, and it may be that something can be learned of the pathogenesis of the transient paralyses which were common in 1948

We suggest that clinicians explore this problem and urge that fatal cases be investigated as completely as possible The histologic examination should include the paralyzed muscles For animal tests, suitable specimens should be collected from the affected muscles, the central nervous system, and intestinal contents Until morphologic observations of proved cases are available, the nosologic position of the disease will be uncertain Since the collection, storage, and shipment of specimens are of critical importance, physicians who wish to collaborate with us should write for detailed information regarding the methods to be followed Many laboratory directors are prepared to handle such specimens and health officers are frequently able to help

DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL, DIRECTOR

THE Third Annual Report on the six New York State voluntary nonprofit medical care insurance plans, approved by the Medical Society of the State of New York, shows continuous and notable progress during 1948

Membership —The increase in membership was 515,644, making the total membership as of December 31, 1948, 1,539,259 This represents the largest increase in membership in any year and exceeds 1947 by 90,071 members

Earned Premium Income.—The income earned on premiums received amounts to $9,299,668 which is an increase of $3,390,003 over the previous year, or 57 per cent

Benefit to members —Incurred benefits to members was $6,369,388, an increase of $2,687,833 over the previous year, or 73 per cent

Payments to Doctors —For discharged and completed claims, payments to doctors were in the amount of $6,017,004.

Surplus and Maternity Reserve —The total surplus as of December 31, 1948, amounted to $2,065,693, an increase of $596,298 over the previous year

Reserves for deferred maternity benefits as of December 31, 1948, amounted to $1,613,439, an increase of $615,594 over the previous year

A greater increase in membership can be anticipated during 1949 due to a better understanding by the profession and increased doctor participation in the plans, plus the increased appreciation on the part of the public of providing for medical care costs on a voluntary basis

The quarterly reports which have been submitted to the Bureau by the plans have made this report possible Additional information has been compiled from these reports and is available upon request.

NECROLOGY

LeRoy Becker, M.D., of Cobleskill, died on April 28 of a heart attack, while working in his garden. He was eighty years of age. A graduate of Albany Medical College in 1892, Dr. Becker had practiced medicine in Cobleskill for more than fifty years. He had served as coroner of Schoharie County and as physician at the Cobleskill Central School. He was a member of the New York State and Schoharie County Medical Societies and the American Medical Association.

Nathan Berger, M.D., New York City, died on February 12 at the age of fifty-seven. A graduate of the Long Island College Hospital in 1917, he was honorary assistant ophthalmologic surgeon at the New York Eye and Ear Infirmary and was a member of the New York State and County Medical Societies and the American Medical Association.

Anson Holden Bingham, M.D., seventy, died on April 22 at his home in New York City. Dr. Bingham was graduated from the New York Homeopathic Medical College and Flower Hospital in 1900 and interned at the Hahnemann Hospital before establishing his practice in New York City. He was orthopedic surgeon at the Flower and Fifth Avenue Hospitals and consulting orthopedic surgeon at the Metropolitan Hospital, New York City, the Yonkers General Hospital, Yonkers, and the Goshen Hospital, Goshen. A fellow of the American College of Surgeons, Dr. Bingham was a diplomate of the American Board of Orthopedic Surgery and a member of the New York State and County Medical Societies and the American Medical Association.

Fred Robert Driesbach, M.D., of Dansville, died on April 25 at the Dansville Memorial Hospital, which he had helped establish. He was eighty-three years old. A graduate of the College of Physicians and Surgeons, Columbia University, in 1889, Dr. Driesbach served for forty-seven years as coroner of Livingston County and had been a practicing physician for almost sixty years. He was instrumental in founding the Dansville Memorial Hospital in 1920 and served as chief of the medical and surgical staff and president of the board of directors. In 1948 he was elected president emeritus. Until his retirement in 1947, Dr. Driesbach had also served as surgeon for the Lackawanna Railroad. He was one of the oldest practicing physicians in New York State, and his term as coroner is believed to have been the longest served by any coroner in the State. He was a member of the New York State and Livingston County Medical Societies and the American Medical Association.

Richard Fleischer, M.D., fifty-eight, of New York City, died on May 8 at Mount Sinai Hospital after a brief illness. A native of Baireuth, Germany, Dr. Fleischer was educated at the Universities of Breslau and Munich, and received his medical degree from Erlangen in 1916. He was in charge of the obstetric hospital in Fuerth, Bavaria, before coming to this country in 1936. Dr. Fleischer was associate obstetrician at Beth Israel Hospital, clinical assistant in gynecology at the Hospital for Joint Diseases, and senior clinical assistant in gynecology at Mount Sinai Hospital. He was a member of the New York State and County Medical Societies and the American Medical Association.

William John Gaudineer, M.D., died at his home in Pelham Manor on May 6 at the age of ninety-three. A practicing physician until his retirement ten years ago, Dr. Gaudineer was graduated from the New York University Medical School in 1878 and was on the staff of St. Luke's Hospital, New York City, for more than thirty years.

Frank R. Geyser, M.D., of Queens, died on April 29 in Trenton, New Jersey, of a heart attack. He was sixty-four. Dr. Geyser was graduated from the Fordham University Medical School in 1906 and was formerly assistant professor of physical therapy there. During World War I, he served in the Army Medical Corps as a captain. He was a physician for the Prudential Insurance Company.

Edgar James Gilray, M.D., of Cuba, died on March 27 at the Cuba Memorial Hospital at the age of eighty-three. He was graduated from the University of Buffalo Medical School in 1891 and from 1895 to 1910 was medical superintendent of the Erie County Hospital. For ten years he practiced medicine in Alberta, Canada, and in 1920 returned to Cuba to open his practice there. He was a member of the New York State and Allegany County Medical Societies and the American Medical Association.

Silas Farnsworth Hallock, M.D., eighty-seven, died at his home in New York City on April 24. He received his medical degree from Western Reserve University, Cleveland, Ohio, in 1885, and for many years was associated with the Manhattan Eye and Ear Hospital. Dr. Hallock was a director of the Physicians' Home and was a member of the New York Academy of Medicine, the New York State and County Medical Societies, and the American Medical Association.

Abraham Hymanson, M.D., of New York City, died on April 24 at Beth Israel Hospital, at the age of eighty-four. Born in Russia, he came to this country as a young man. After graduation from City College, he received his medical degree from the New York University Medical School in 1892. Dr. Hymanson was a member of the first intern class at Beth Israel Hospital and was its oldest alumnus. He was consulting pediatrist at Beth Israel and Beth David Hospitals and a member of the executive committee of the American Jewish Physicians Committee.

Author of many articles on medical subjects, Dr. Hymanson contributed several original studies of Mongolian idiocy in children. He was an organizer of the Eastern Medical Society, formed forty years ago for the exchange of medical information among physicians of the lower East Side, and served for many years as vice-president and chairman of its committee on ethics. He was a member of the New York Academy of Medicine, the New York State and County Medical Societies, and the American Medical Association.

Dwight Fenn Johnson, M.D., seventy, died on April 24 at his home in Newark, of a heart attack. He received his medical degree from Cornell University Medical College in 1903, and interned at Bellevue Hospital where he served on the staff until 1906 when he established private practice in Newark. Dr. Johnson had served for thirty-seven years as

HOSPITAL NEWS

Voluntary Hospitals Fiscal Condition "Not Precarious"

"THE financial position of voluntary hospitals is not so precarious as to warrant immediate financial assistance by the state," a Columbia University professor declared in an interim report submitted to the State's joint hospital survey and planning commission.

However Dr Eli Ginsberg, associate professor of economics in Columbia's School of Business, said this assurance is based on the assumption there will be no serious business depression in 1949

Dr Ginsberg is making a study of the social and economic aspects of hospital finance for Columbia University, under contract with the State

His interim report has been accepted by the hospital survey and planning commission The final report is due in September

The study is gathering available information on the financial structure of voluntary hospitals, adequacy of State hospital system, the "changing role" of the hospital in the community, and the administrative and financial interrelations between voluntary groups and government.

The joint hospital survey and planning commission was set up by the legislature in 1947 to inventory hospital facilities, make a survey of hospital needs and develop a program for hospital construction with the use of Federal funds.

Its comprehensive hospital program to meet demands for care was outlined last year It recognized that the problem of hospital finance is becoming critical because of increased wages, costs of supplies, and mounting demands for effective but expensive medical services

Last August it contracted with Columbia for the study which is expected to show, among other things, the extent to which the government must give financial support to hospitals or contribute to hospitalization insurance programs.

Broader Function of Hospitals Cited

THE hospitals can contribute effectively as health centers to a broad program of preventive medicine, providing a "total of services required to maintain and foster health," Dr Stanhope Bayne-Jones president of the joint administrative board of the New York Hospital-Cornell Medical Center, told a gathering of 2,000 physicians March 28 He addressed the opening general session of the American College of Physicians' annual meeting at the Waldorf-Astoria Hotel, New York City

The functions of hospitals, Dr Bayne-Jones said, extend beyond the care of the sick in their inpatient and outpatient departments They render service not only for the reconstruction of health, through curative medicine, but also for the construction and preservation of health, through preventive medicine.

"The realization that there are early beginnings of the chronic diseases of those over 40 years of age—diseases increasing in frequency and importance with the increasing age of the population—forces attention to early diagnosis and preventive clinical medicine," Dr Bayne-Jones declared. Study and work along these lines, he added, "will occupy an increasing amount of time and activities of the professional medical and nursing staffs of hospitals."

Dr Bayne-Jones outlined the possibilities and requirements for future expansion and development of hospitals as centers of preventive medicine. These included the development of diagnostic clinics for the examination of the sick and the well, the enlargement of consultation services for patients and doctors of the community, the development of group practice both within the hospital and in connection with groups of physicans outside the hospital, extension of hospital connections with private practitioners, particularly the general practitioner, development of home-care programs with a base in the hospital, education and training in preventive medicine and constant research

Establish Cardiac Clinic at Medical Center

A "WORK Classification Unit" to determine the type of occupations persons with heart disease may safely hold in business and industry has been set up at the Cardiac Clinic of the New York University-Bellevue Medical Center The Unit is now engaged in classifying approximately 1,000 ambulatory patients having heart disease.

Designed to evaluate the appropriateness of jobs held by individuals with heart disease and to offer guidance to those in unsuitable vocations, the survey will take more than a year's time for completion. It will be conducted among the outpatients attending the Bellevue Hospital Thursday Night (N Y U) Cardiac Clinic

The Survey is, according to Dr Charles E Kossmann, assistant professor of medicine at New York University College of Medicine and director of the Bellevue Thursday night clinic, "one of the first analyses ever made of the physical, mental, and vocational capacities of a large group of individuals with heart disease, as well as of their needs for occupational readjustments."

Dr Leonard Goldwater, authority on industrial medicine and professor of industrial hygiene at Columbia University, is the Unit's director The New York Heart Association is underwriting the work financially and has representatives on the scene to collect and correlate nonmedical material

health officer of the town of Arcadia and was former president of the Wayne County Medical Society During World War II he was chairman of the physician classification board and a medical examiner for the Selective Service Board. Dr Johnson was a member of the Geneva Academy of Medicine, the American Academy of General Practice, the New York State and Wayne County Medical Societies, and the American Medical Association.

Frederick William Lederman, M D, forty-nine, died on January 1 in New York City He received his medical degree from the University of Breslau in 1925 and was clinical assistant in chest diseases at the Hospital for Joint Diseases, New York City Dr Lederman was a member of the New York State and County Medical Societies and the American Medical Association

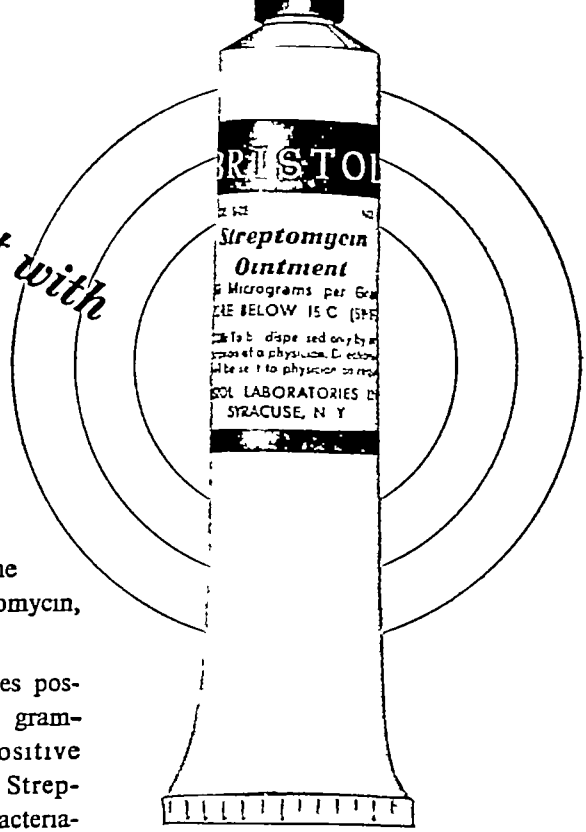
Carl Esselstyn McCombs, M.D, of Chappaqua, died on May 6 after a long illness He was sixty-six years old A graduate of the Cornell University Medical College in 1909, he was a house surgeon at Harlem Hospital, New York City, before opening a practice in Schenectady Several years later he returned to New York City and engaged in public health work A pioneer in public health and welfare administration, Dr McCombs was a member of the staff of the Institute of Public Administration and the author of *City Health Administration*, published in 1927 For many years he was active in the American Public Health Association, the American Hospital Association, the Governmental Research Association, the American Statistical Association, and the Public Health Association of New York City Dr McCombs was a former member of the Westchester County Commission on Government

Roger Depew Mead, M D, sixty-seven, of Endicott, died on March 31 in St Petersburg, Florida, after two years illness Dr Mead was graduated from the Syracuse University College of Medicine in 1908 and opened his practice in Endicott He had served more than fifteen years as area medical examiner for the Civil Aeronautics Administration and was also an examiner for the United States Civil Service Commission In 1948, Dr Mead was honored by the Endicott Eagle Lodge as an outstanding citizen because of his long service to the community A former president of the staff of Endicott Ideal Hospital, Dr Mead was a member of the New York State and Broome County Medical Societies, and the American Medical Association

John Lawrence O'Brien, M D, the Bronx, died suddenly of a heart attack on May 3 while attending the annual meeting of the Medical Society of the State of New York at the Hotel Statler, Buffalo He was fifty-one Dr O'Brien was a delegate from the Bronx County Medical Society A graduate from the Yale University Medical School in 1924, he was associate surgeon at St. Francis Hospital He was former president of the Bronx Medical Association, and chairman of the economics committee of the Bronx County Medical Society Dr O'Brien was a member of the New York State and Bronx County Medical Societies and the American Medical Association

Paul E Santangelo, M.D, fifty-one, died on April 25 at his home in Brooklyn He received his medical degree from Fordham University in 1921, after his college studies had been interrupted by service in World War I Dr Santangelo was associate surgeon at Cumberland Hospital and the Brooklyn Cancer Institute, and associate attending surgeon at Prospect Heights Hospital, all in Brooklyn. He was a member of the New York State and Kings County Medical Societies and the American Medical Association

Augustus B Santry, M.D, of Little Falls, died on April 23 at his home at the age of eighty-one He received his medical degree from the University of Maryland School of Medicine in 1896 and had practiced medicine in Little Falls for more than fifty years, until his retirement in 1946 Dr Santry had been mayor of Little Falls in 1908 and 1909 and again from 1932 to 1936 He also served as city health officer for more than twenty years. He was a member of the New York State and Herkimer County Medical Societies and the American Medical Association.



Jacob Silver, M.D, fifty-six, New York City, died on February 15 He received his medical degree from Fordham University in 1918

Harrison Greenleaf Sloat, M.D, a retired surgeon for the United States Veterans Administration, died on April 30 at his home in Fishkill He was seventy While still a student, he joined the Navy during the Spanish-American War, and was graduated in 1901 from the New York Homeopathic Medical College After internship, he joined the faculty of the medical school and later practiced in Glen Cove, Long Island. During World War I, Dr Sloat served overseas as a captain in the Army Medical Corps In 1921, he joined the Veterans Administration and was assigned to its hospital at Fort Lyon, Colorado He later served at hospitals in Rutland, Massachusetts, and Aspinwall, Pennsylvania His last assignment was at the Veterans Hospital at Castle Point, where he served from 1936 until his retirement last year after twenty-one years with the V A.

Willard Hamilton Sweet, M D, seventy-eight, died on April 24 at his home in Peekskill He had been a practicing physician and surgeon for fifty-five years until his retirement in 1947 Dr Sweet was graduated from the Albany Medical College in 1892 and interned at St Peter's Hospital, Albany, before opening general practice in Petersburg, his birthplace. In 1907 he came to Peekskill and established his practice there He was a member of the medical board of the Peekskill Hospital. Dr Sweet belonged to the New York State and Westchester County Medical Societies and the American Medical Association

Irving I Weiner, M.D, of Brooklyn, died on April 10 at the Jewish Hospital, Brooklyn, at the age of fifty He received his medical degree from the New York Homeopathic Medical College in 1923 and had a private practice in Brooklyn before World War II He served in the Army Medical Corps from 1942 to 1946, and was a physician with the Veterans Administration branch office in New York City Dr Weiner was a member of the American Congress of Physical Medicine, the New York State and Kings County Medical Societies, and the American Medical Association

Hit the Whole Target with

Bristol Streptomycin Ointment

When attacking skin and wound infections, more than half of which "will be found to be due to a mixture of organisms",[1] the effective agent is one which, like streptomycin, has a wide antibacterial effect.

BRISTOL STREPTOMYCIN OINTMENT makes possible potent local action against most gram-negative and many common gram-positive organisms (such as Staphylococci and Streptococci) Its bacteria-destructive and bacteria-inhibitory effect is broader than other topical antibiotics It is, therefore, effective against more skin and surface wound infections

BRISTOL STREPTOMYCIN OINTMENT, demonstrably less sensitizing than other antibiotics used topically, may be employed with little fear of local reaction Adverse systemic effects have not been seen following its use

BRISTOL STREPTOMYCIN OINTMENT is indicated for the treatment of wound and skin infections due to organisms sensitive to streptomycin Incorporated in a smooth water-soluble base, it is convenient and pleasant to use

Bristol
LABORATORIES INC
SYRACUSE, NEW YORK

(1) F L. Meleney Surg Gynec. & Obst 86 760 (June) 1948

Bristol Streptomycin Ointment, containing 5000 micrograms of streptomycin sulfate per gram is available in 1 oz. tubes

Statistics developed by the survey will seek to demonstrate that it is poor business to reject for employment a talented and otherwise able candidate on the grounds that he has heart disease Within reasonable limits and under medical supervision the majority of persons who have heart disease can safely engage in regular occupations, it is contended

For those patients who must adapt themselves to new occupations, rehabilitation training is offered

Physicians of the Center's Institute of Rehabilitation are in constant attendance at sessions of the Work Classification Unit for the purpose of developing new methods that will enable cardiac sufferers to extend their earning capacities

The Bellevue cardiac clinic, in which the work classification survey is being made, is the oldest clinic in the country for the care of ambulatory patients with heart disease

NEWS NOTES

Dr John C Brady, Buffalo, a member of the Erie County Medical Society, spoke on "The Evils of Socialized Medicine" at a special meeting of the Lockport Hospital Guild held March 28 in Lockport The program was sponsored by the Hospital Guild with the cooperation of the Niagara County Medical Society and its Auxiliary

The general practitioner's place on hospital medical staffs was discussed by Dr Robert H Lowe, director of Rochester General Hospital, Rochester, at the twenty-sixth annual meeting of the New England Hospital Assembly, held in Boston, Massachusetts, on March 30 The Rochester General Hospital was the first city hospital to inaugurate a refresher training program for general practitioners last year

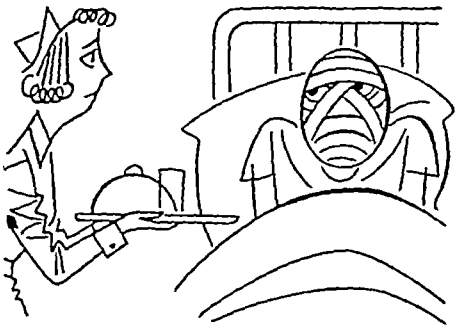
The annual Chest Conference of St John's Episcopal Hospital, Brooklyn, was held May 21 at the Hospital. Dr Charles E Hamilton presided at the morning session, which included the following program "Admission Miniature X-ray," Dr J Mangiardi, "Pre- and Postoperative Management of Thoracic Surgery Patients," Dr E K. Johnson, "The Right-sided Approach to Carcinoma of the Esophagus," Dr Raymond K J Luomanen, and 'Cancer of the Lung—Methods of Diagnosis," Dr Alfred Bicunas Dr Merrill M Foote presided at the afternoon session, which included "A Review of 1948," Dr E K. Johnson, and the Bishop De Wolfe Lecture on "Cancer of the Esophagus" by Dr Richard H Sweet, visiting surgeon of the Massachusetts General Hospital, Boston in cooperation with the Brooklyn Cancer Committee

The seventh Bela Shick Lecture was presented on May 11 in the Blumenthal Auditorium of Mount Sinai Hospital, New York City, under the sponsorship of the board of trustees and the medical staff of the Hospital Dr Selman A. Waksman, professor of microbiology at Rutgers University, New Brunswick, New Jersey, and microbiologist at the New Jersey Agricultural Experiment Station, spoke on "Searching for New Chemotherapeutic Agents"

Dr Alfred A Orans, Westbury, was recently added to the medical staff of the Nassau Hospital,

it was announced in April National Hospital Day was observed at the hospital on May 2 in a joint celebration marking the twenty-fifth anniversary of the Women's Auxiliary to Nassau Hospital. During the day, the public was admitted for tours directed by student nurses through the hospital.

A postgraduate course in "Modern Treatment of Fractures and Other Traumatic Conditions" will be held at the Massachusetts General Hospital, Boston, from October 24 to November 3, 1949, under the auspices of the Harvard Medical School Further information may be obtained from the Harvard Medical School, 25 Shattuck Street, Boston, Massachusetts



Dr. John C McClintock, assistant professor of surgery, Albany Medical College, and assistant attending surgeon, Albany Hospital, spoke on "Socialized Medicine" before the student and graduate nurses of the Hospital on April 19

A total of 7,645 patients were admitted to St Elizabeth Hospital, Utica, during 1948, according to the annual report submitted by Sister M Reginasuperintendent The total number of hospital-days treatment was 67 976, and the average number of patients treated each day was 162

The regular meeting of the staff of St Francis Hospital, Poughkeepsie, was held on April 4. Case presentations were given by Drs. Florence Gottdiener, R T Lapidus, J J Toomey, and Barbara Stimson, and were discussed by Dr F A Gagan.

Recent speakers at the Castle Point Veterans Hospital have included May 2—Dr Irving R. Tabershaw, "Pulmonary Industrial Disease with Special Emphasis on Beryllium Poisoning," and May 24—Dr Richard Donovick, "Streptomycin and Dihydrostreptomycin"

On May 27, the Veterans Administration Surgical Therapy Conference was held, with discussion on "Resection in Tuberculosis" and "Recent Advances in the Surgical Therapy of Pulmonary Tuberculosis"

Soft-diet patients down in the mouth?

Perk up appetites with Swift's Strained Meats!

6 varieties
Beef lamb pork, veal liver, heart

Simply putting soft foods on a tray is no assurance that patients will put them away. That's why so many physicians today are recommending Swift's Strained Meats—flavorful, real meats they're sure patients will eat! Prepared specially, soft and smooth, Swift's Strained Meats are so good they tempt even the most apathetic appetites!

Nutritionally, Swift's Strained Meats afford an excellent base for a high-protein, low residue diet. They're highly digestible—easy to eat. Rich in biologically valuable proteins, they make available simultaneously all known essential amino acids—for optimum protein synthesis. Further, Swift's Strained Meats supply hemapoetic iron and goodly amounts of natural B vitamins. Let protein-rich Swift's Strained Meats put palatability in menus for your soft-diet patients!

To vary patients' menus, six different Swift's Strained Meats: beef, lamb, pork, veal, liver, heart. Convenient—ready to heat and serve!

The makers of Swift's Strained Meats invite you to send for the new physicians' handbook of protein feeding, written by a doctor. The Importance of Protein Foods in Health and Disease. Send to

SWIFT & COMPANY

Chicago 9, Illinois

All nutritional statements made in this advertisement are accepted by the Council on Foods and Nutrition of the American Medical Association.

For patients who can take foods of less fine consistency—Swift's Diced Meats offer tender morsels of nutritious meats with tempting flavors patients appreciate.

MEDICAL NEWS

2,500 Attend 143rd Annual Convention of State Society

WITH a total registration of almost 2,500, including 1,609 physicians, 538 guests including medical students, interns, nurses, and doctors' wives, and 335 exhibitors, the 143rd annual convention of the Medical Society of the State of New York was held at the Hotel Statler, Buffalo, from May 2 through 6, 1949

Sessions of the House of Delegates were held on Monday, Tuesday, and Wednesday, with Dr Albert F R. Andresen, Brooklyn, as speaker (A report of the proceedings will be published in a later supplementary issue of the JOURNAL.) Scientific sessions and sections met during the week, and scientific and technical exhibits were on display

At the annual elections held Wednesday morning, May 4, Dr Carlton E Wertz, of Buffalo, was chosen president-elect of the State Society Dr Wertz will serve for one year, after which he will succeed Dr John J Masterson, of Brooklyn, who was installed as president Dr Masterson succeeds Dr Leo F Simpson of Rochester

Dr Wertz, a member of the Council of the State Society for the past five years, also is chairman of the State Society's Economics Committee. He is a past-president of the Medical Society of the County of Erie and past-president of the Buffalo Academy of Medicine. He is a member of the Workmen's Compensation Board of the Erie County Medical Society

Other officers elected by the House of Delegates were Dr James E McAskill of Watertown, vice-president, Dr W P Anderton, of New York City, secretary, Dr Andrew A Eggston of Mount Vernon, assistant secretary, Dr James R. Reuling of Bayside, treasurer, Dr Fenwick Beekman of New York City, assistant treasurer, Dr Albert F R. Andresen of Brooklyn, speaker of the House of Delegates, and Dr Frederic W Holcomb, of Kingston, vice-speaker of the House of Delegates Dr William H Ross of Brentwood was re-elected as a trustee for five years and Dr Dan Mellen of Rome was re-elected as a trustee for four years Councilors elected were Dr Theodore J Curphey, Garden City, Dr Harold F R. Brown, Buffalo, Dr Elton R. Dickson, Binghamton, Dr Leo E Gibson, Syracuse, Dr George C Adie New Rochelle, and Dr Renato J Azzari Bronx.

Delegates to the American Medical Association elected at the annual meeting were Dr Renato J Azzari, the Bronx, Dr Peter J Di Natale, Batavia, Dr Andrew A. Eggston, Mount Vernon, Dr Joseph P Henry, Rochester, Dr J Stanley Kenney, New York City, Dr George W Kosmak, New York City, Dr John J Masterson, Brooklyn, Dr Thomas A. McGoldrick, Brooklyn, Dr Stephen R. Monteith, Nyack, Dr Peter M Murray, New York City, and Dr Leo F Simpson, Rochester

Alternate delegates elected were Dr Samuel B Burk, New York City, Dr Maurice J Dattelbaum, Brooklyn, Dr Thomas M D'Angelo, Jackson Heights, Dr John L Edwards, Hudson, Dr Joseph A Geis, Lake Placid, Dr Daniel J McAuliffe, Bronx, Dr Madge C L. McGuinness, New York City, Dr Scott Lord Smith, Poughkeepsie, Dr Denver M Vickers, Cambridge, Dr Thomas M Watkins, Potsdam, and Dr E A. Wolff, Forest Hills

Dr Edward T Wentworth, Rochester, is the new chairman of the Board of Trustees

Scientific papers which were presented at the meeting will be published, according to sections and sessions, in the NEW YORK STATE JOURNAL OF MEDICINE, beginning with the July 1 issue.

Awards made for scientific and clinical research exhibits at the convention include

Scientific Research—Dr Nathan E Woodruff, Oak Ridge, Tennessee, "Radio Isotopes" —first award

Dr Sidney A Gladstone, New York Polyclinic Medical School and Hospital, "Sponge Biopsy—A New Method in Cancer Diagnosis"—second award

Dr Louis E Etter Western State Psychiatric Institute and Clinic Pittsburgh, Pennsylvania, "New Method for Roentgen and Anatomic Study of the Skull"—honorable mention

Clinical Research—Dr David Lehr, New York Medical College, "Low Toxicity of Sulfonamide Mixtures"—first award

Dr Charles A R. Connor, American Heart Association, New York City, "Etiologic Diagnosis of Heart Disease"—second award

Dr Charles LeRoy Steinberg, Rochester, "Gold Toxicology in Rheumatoid Arthritis"—honorable mention.

At the annual banquet held on May 4, Dr A. H Aaron, Buffalo, acted as toastmaster, and addresses were made by the retiring president, Dr Simpson, who received the President's Medal from Dr William H Ross, Brentwood, chairman of the Board of Trustees, the incoming president, Dr Masterson, Dr Rose M Lenahan, vice-president of the Women's Medical Society of New York, Dr Arthur D Jacques, New York State's outstanding general practitioner for 1948, and Dr Morris Fishbein, editor of the *Journal of the American Medical Association*

The Fifty-Year Veterans

ONE hundred six members of the Medical Society of the State of New York were honored at the 143rd Annual Meeting of the Society on having completed fifty years of practice in the medical profession Each physician was awarded a certificate commemorating his long period of service, at the Annual Banquet on May 4. The JOURNAL extends its congratulations to these doctors whose names are as follows

LEWIS P ADDOMS, M.D , Brooklyn
ANNA M AGNEW, M.D , Brooklyn
GEORGE EVERETT BEILBY, M D , Albany
LESTER BETTS, M D Schenectady
LOUIS J BEYER, M D , Buffalo
EDGAR BIRDSALL, M D , Glens Falls

You have one outstanding drug

for the treatment

of depression

In the depressed patient, 'Dexedrine' Sulfate can be depended upon to dispel the characteristic "chronic fatigue"; to induce a feeling of energy and well-being; and to restore optimism, mental alertness and capacity for work.

Dexedrine's anti-depressant effect is notable for its freedom from distracting elation, irritability and inward nervous tension. Its uniquely "smooth" action spares the patient the uncomfortable feeling of "drug stimulation".

MEDICALLY SPEAKING—

Civilian Doctors Sought for Panama Canal Zone—Permanent appointments for physicians in the Civil Service now exist in the Panama Canal Medical Service, according to an announcement from the Office of the Panama Canal, Washington, D C

Starting professional salaries are $5,599 and $6,540 a year, with free transportation to the Canal Zone provided for physicians, their families, and household goods. In addition, doctors who receive appointments get two months paid vacation (including time lost by illness) and reduced fares on Panama Line passenger vessels

Requirements for professional medical positions starting at $5,599 are as follows graduation from an approved medical school, license to practice medicine in a state, ability to pass a standard physical examination, and completion of one year's internship in a hospital approved by the American Medical Association

Requirements for professional medical positions starting at $6,540 are the same except that a minimum of three years of postinternship experience is required

Physicians who are interested in a position as medical officer in the Panama Canal Zone should address their applications to the Chief of Office, The Panama Canal, Washington 25, D C Applications may also be submitted to the U S Civil Service Commission, Washington 25, D C

New York's Blue Cross Plan Breaks Enrollment Record—Enrollment of 275,676 persons in Associated Hospital Service, New York's Blue Cross Plan, during the first three months of 1949, represented the largest gain for any calendar quarter in the organization's history and brought the total enrollment to 3,901,997, it was announced recently by Louis H. Pink, president, at the annual meeting of

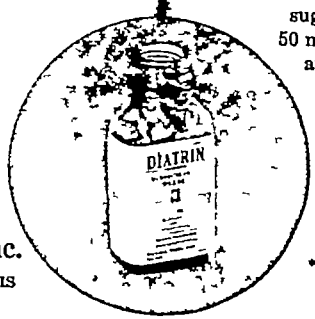
The Outstanding



Antihistaminic

DIATRIN* hydrochloride 'Warner' provides prompt and effective relief of allergic symptoms with minimum by-effects

Unpleasant side-reactions such as drowsiness, lethargy, nausea, vomiting and dizziness are rarely encountered in the clinical use of DIATRIN* hydrochloride

In toxicity studies, DIATRIN* hydrochloride has been found to be approximately one-half to three times less toxic than other antihistaminic substances tested

DIATRIN* hydrochloride sugar-coated tablets, 50 mg each, are available in bottles of 100 and 1000

the board of directors held at headquarters, 80 Lexington Avenue, New York City

The total enrollment for the first three months of 1948 was 154,772, Mr Pink declared.

Per Patient Eye Care Cost in Great Britain 60 Per Cent Higher Than in U S—In terms of purchasing power, the per patient cost of eye care, including professional fee and eyeglasses, is approximately 60 per cent higher in Great Britain under its national health service program than in the United States, Walter A. Stewart, president, American Optical Company, stated in a recent address

Reporting on eye care in Great Britain where a comprehensive national health service includes free ophthalmic services and spectacles, Mr Stewart said that even with an increase in the British population receiving yearly eye care, "England will have reached only the point in general eye care we arrived at several years ago"

The ophthalmic professions in the United States, he pointed out, "through their education, training, and skill, have kept pace with the ever-increasing need for eye care and are in a position to provide the requisite professional services"

Britain's experience with free eye care is particularly illuminating from an economic point of view, Mr Stewart said, noting that "the annual cost was originally estimated at $10,000,000 The actual cost for the first year will come close to $60,000,000, or 600 per cent more than was estimated."

Israeli Medical School Opens in Jerusalem—The Hebrew University-Hadassah Medical School, the first medical school to be established in the new state of Israel, will open its doors May 17, 1949, as a joint undertaking of the Hebrew University and Hadassah, the Women's Zionist Organization of America. Until security conditions permit continuation of construction on Mt Scopus, the site of the present 400-bed Rothschild-Hadassah-University Hospital, the School will be housed in four hospital units, totaling initially over 300 beds, in the city of Jerusalem proper

Advisory to the School throughout its planning stage and instrumental in the procurement of faculty and in the placement of medical personnel for postgraduate study is the Medical Reference Board of Hadassah and the Hebrew University A volunteer group of distinguished American physicians, medical administrators, and public health experts, the Medical Reference Board numbers amongs its members Dr E. M Bluestone, chairman, Dr Louis I Dublin, Dr Thomas D Dublin, Dr Harry Eagle, Dr Abraham Flexner, Dr Jonas S Friedenwald, Dr Jacob J Golub, Dr Maurice B Hexter, Dr William A. Perlzweig, Dr Israel S Wechsler, Dr Charles F Wilinsky, and Dr Abel Wolman

Supplement to Medical Fee Schedule Adopted—Miss Mary Donlon, chairman of the Workmen's Compensation Board, recently announced that a Supplement to the Medical Fee Schedule had been adopted, effective May 1, 1949

"The present Medical Fee Schedule in workmen's compensation, which became effective last September 1 and covers approximately one thousand items of medical service in the treatment of workmen's compensation claimants, was the first complete revision in twelve years Quite naturally it gave rise to some inquiries and these the newly adopted supplement clarifies," Miss Donlon explained.

Copies of the Supplement will be mailed to each of the 25,000 physicians authorized to render medical care under the Workmen's Compensation Law

National Cancer Institute Grants—Grants of $293,452 by the National Cancer Institute to support laboratory and clinical research and of $79,853 for research facilities were announced today by Oscar R. Ewing, Federal Security Administrator The grants were approved by Surgeon General Leonard A. Scheele of the U S Public Health Service following recommendation by the National Advisory Cancer Council and are in addition to research grants of $671,200 announced on March 25

The following New York State institutions have been awarded continuation grants under the recent appropriation

Cornell University Medical College—$19,000 for studies on mechanisms of resistance to cancer and effects of tumor cells of an antibiotic form, Aspergillus fumigatus, under Dr John G Kidd

College of Physicians and Surgeons, Columbia University—$11,000 to continue study on the relationship of undifferentiated epithelium and reticulum in the evolution of adenocarcinoma of stomach produced by carcinogens, under Dr Edward Lee Howes.

Harlem Hospital—$20,000 for study on an evaluation of the effects of chemotherapeutic agents in neoplastic and associated virus diseases, under Dr Louis T Wright

Death Rate Lower in First Quarter of 1949—There was a pronounced drop in the general death rate in the first four months of this year as compared with same period in 1948, the Department of Health has announced There were 27,244 deaths from all causes in New York City in the first four months of 1949 giving a general death rate of 10 2 per 1,000 of population as against 30,092 deaths giving a general death rate of 11 5 for the first four months of 1948 This is a drop of 11 per cent

In the first four months of this year there were 988 deaths attributed to pneumonia against 1,322 attributed to that disease in the same period of 1948, probably because of the mild weather

So far this year there have been no deaths reported as caused by diphtheria, measles, or scarlet fever

In April, there were 6,821 deaths from all causes giving a general death rate of 10 2

There were 13,314 births in April (or an average of 444 a day) yielding a birth rate of 19 8 per 1,000 of population Births in the first four months this year totaled 53,005 with a birth rate of 19 8.

The April infant mortality rate was 25 2 per 1,000 live births, somewhat higher than the previous month's rate of 24.6 The stillbirth rate of 93 4 per 1,000 live births is somewhat lower than the March, 1949 rate of 97 0

Sixteen maternal deaths were reported for the month, with a rate of 12 0 per 10,000 live births This is an increase over the previous month's rate of 6 3

Chickenpox cases continued at a high level with 2,597 cases being reported during the month Although there is a decrease from the previous month's high of 3,065 cases, this month's total is the second highest in the Department's history There were 9,105 chickenpox cases reported for the first four months of this year

Award-Winning Army Film Available—The Army Medical Department-Signal Corps motion picture entitled, "Toward Independence," is available on a loan basis to all military organizations and to any nonprofit civilian group The film may be obtained from the nearest Signal Corps *Film Library or by*

Number of subscribers	
As of December 31, 1948	1,128,967
As of March 31, 1949	1,294,314
Paid for medical care of U M S subscribers	
For twelve months of 1948	$4,390 730
For first three months, 1949	1,339,118
(First three months, 1948—$794,357)	
Participating physicians	16 894

MEETINGS

Past

Middle Atlantic States Regional Conference

The manner in which seven state medical societies are implementing the National Education Campaign of the American Medical Association was the central theme of discussion at the Middle Atlantic States Regional Conference on April 21 in the auditorium of the Philadelphia County Medical Society

The Medical Society of the State of New York was represented by Dr J Stanley Kenney, member of the executive committee, Mr Dwight Anderson, director of Public Relations, and Thomas E Walsh and Frederick W Miebach of the Public Relations Bureau

Reports on campaign activities were made by representatives of the state societies of Virginia, Maryland, Delaware, New Jersey, Pennsylvania, and New York, and a special report by Dr John F Conlin of the Massachusetts society In addition, the conference was addressed by Dr Joseph S Lawrence, director of the Washington office of the A M A. Mr Thomas Hendricks, executive secretary of the A.M A Council on Medical Service, Mr Thomas Holloway, director of the A M.A Bureau of Legal Medicine and Legislation, and Marjorie Shearon, of Washington, D C

Medical Film Institute of the Association of American Medical Colleges

The Navy film, "Typhus in Naples," and two other medical motion pictures were shown at the opening of the Medical Film Institute of the Association of American Medical Colleges on April 28 at the New York Academy of Medicine. The program also included an illustrated talk, entitled "Blueprint for Medical Television."

Conference on Law, Medicine, and the Unstable Family

A Conference on Law, Medicine, and the Unstable Family was held on April 29 at the New York Academy of Medicine under the joint sponsorship of the Academy and the New York County Lawyers' Association Speakers included Dr Benjamin P Watson, president of the New York Academy of Medicine, and Mr I. Howard Lehman, president of the County Lawyers' Association, also Drs. Abraham Stone, Herbert B Wilcox, Jr , Iago Galdston, and Lawson G Lowrey

State Charities Aid Association

Midcentury review of aims and gains in public health and public welfare in the State was the theme of the annual conference of the State Committee on Tuberculosis and Public Health of the State Charities Aid Association in New York City, May 10 and 11

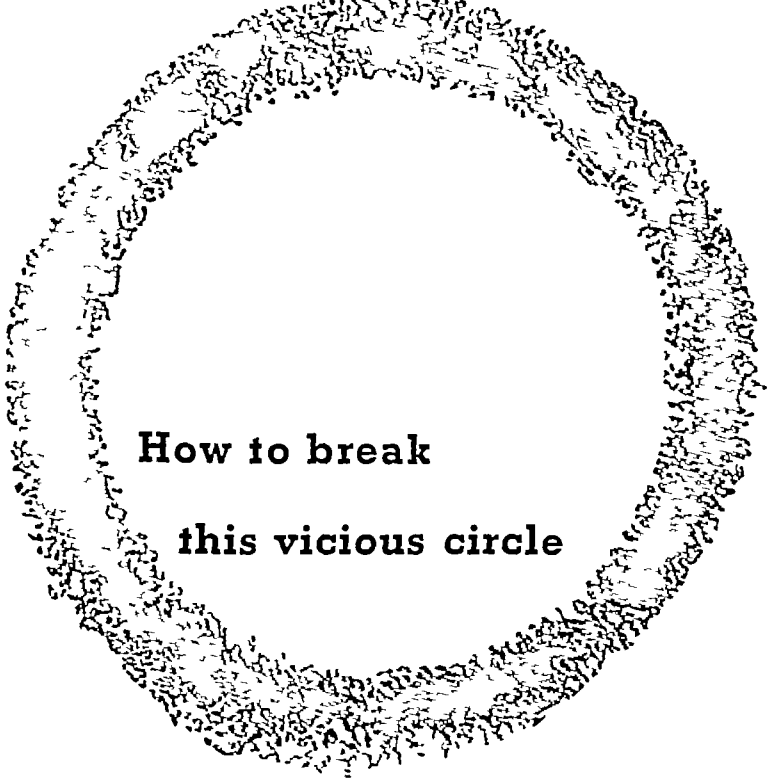
Public sessions featured the status of tuberculosis control at the midcentury, venereal disease control progress, public health and public welfare relationships, how to interest young men and women in public health careers, and a session on heart disease.

New York Psychoanalytic Society

Dr Isidor Silbermann was the featured speaker at the May 17 meeting of the New York Psychoanalytic Society Dr Silbermann spoke on "To the Psychology of Menstruation," dealing with some psychologic aspects of menstruation

New York Council of Surgeons

Meetings of the New York Council of Surgeons were held on May 10 and 17 On May 10, Dr Charles W Frank, Bronx Hospital, spoke on "Obstetrical Difficulties," and on May 17, Dr Howard B Shookoff, physician in charge, Tropical Diagnostic Service, New York City Department of Health, gave a talk on "Diagnosis and Treatment of Common Parasitic Diseases"



Association for the Advancement of Psychotherapy

"Disturbances in Acculturation" was the subject of a lecture given by Dr Benjamin Wolman, of Tel Aviv, Israel, at a meeting of the Association for the Advancement of Psychotherapy on May 20

New York State Society of Medical Technologists

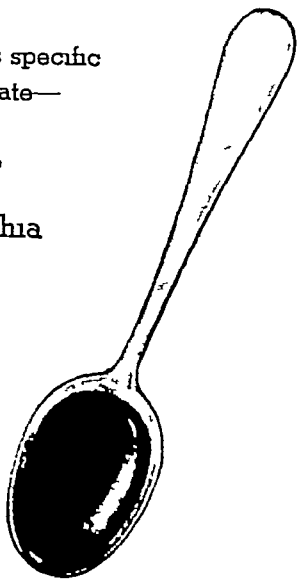
The New York State Society of Medical Technologists held its second annual seminar under the auspices of the Metropolitan branch of the Society on May 21 and 22 in New York City Among the speakers were Dr Andrew Eggston, Dr Ralph Stillman, Dr Joseph Goldzieher, Dr George Papanicolaou, Dr William Singer, Dr Bret Ratner, Dr S Utrecht, and Dr Philip Levine

[Continued on page 1348]

Many infectious diseases of infancy and childhood cause an iron-deficiency anemia This—in turn—makes the patient prone to further infection Result· the vicious circle of infection-anemia-infection

"Prevention of iron deficiency anemia reduces the incidence of intercurrent infection" (M Clin North America 30 87) Therefore, routine administration of Feosol Elixir for some weeks following infection is a sound general rule

In iron-deficiency anemia, iron—and iron alone—is specific Feosol Elixir contains adequate dosage of ferrous sulfate—grain for grain the most effective form of iron



Each 2 fluid drams (2 teaspoonfuls) supplies 5 gr ferrous sulfate

Available in 12 fl. oz bottles.

Smith, Kline & French Laboratories, Philadelphia

REVIEWED

The Diabetic's Handbook. How to Work with Your Doctor Treatment by Diet and Insulin. By Anthony M. Sindoni, Jr , M.D Octavo of 194 pages, illustrated New York, Ronald Press, 1948 Cloth, $3 00

This is a worthy addition to the growing series of handbooks for diabetics It is written simply and pointedly and will be of considerable aid to both patient and physician. The book removes ideas of taint and horror from diabetes and constantly emphasizes the truths of its treatability

MAURICE TULIN

Eskimo Doctor By Aage Gilberg, M.D , translated by Karin Elliott Octavo of 229 pages, illustrated New York, W W Norton & Co , 1948 Cloth, $3 00

Eskimo Doctor will charm laymen and physicians alike It is the account of a young Danish doctor's year among the Eskimos of Thule in Northern Greenland.

Gilberg, obviously an amiable young man (he plays the musical saw!), was enchanted by the simple people among whom he lived The reader will share his life with the greatest interest The rigors of a

Greenland winter are set down with such faithfulness that this reviewer, at least, is convinced that he never wants to visit Greenland during the winter months

MILTON PLOTZ

Psychiatric Examination of the School Child. By Muriel Barton Hall, M D Octavo of 368 pages, illustrated. Baltimore, Williams & Wilkins Co, 1947 Cloth, $4 50

This book represents experience gained by the author in the practice of child psychiatry in England

The first portion is concerned with a brief history of child psychiatry and the method of history-taking The major portion deals with the description of disease and methods of diagnosis In the final chapters, therapy is outlined

The reviewer found the book very interesting and recommends it to those of the profession studying this field

STANLEY S LAMM

Diseases Affecting the Vulva. By Elizabeth Hunt, M D Third edition. Octavo of 211 pages, illustrated. St Louis, C V Mosby Co, 1948 Cloth, $7 50

This book merits the applause which two previous editions have received Written by a dermatologist, its chief interest to the gynecologist is the great number of skin diseases which may affect the vulva, the plates are excellent Other diseases are covered somewhat thinly

CHARLES A. GORDON

Blood Derivatives and Substitutes. Preparation, Storage, Administration and Clinical Results Including a Discussion of Shock, Etiology, Physiology, Pathology and Management. By Charles Stanley White, M D, and Jacob Joseph Weinstein, M D Octavo of 484 pages, illustrated Baltimore, Williams & Wilkins Co, 1947 Cloth, $7 50

This comprehensive volume on plasma transfusion will be useful as a reference work to those specializing in the subject It would have been particularly valuable during the war, but in civilian life where blood is used in preference to plasma it will probably not arouse as much interest Since the book does not deal with whole blood transfusions, there is hardly any discussion of blood grouping or the Rh factor, unfortunately, this short discussion contains errors For example, on page 459, the incorrect notion is advanced that isoagglutinins can be neutralized by "opposite agglutinins" or "antagonistic isoagglutinins." In discussing reactions to plasma transfusions, less than a page is devoted to the very important complication of transfusion jaundice, and no mention is made of the fact that the best prophylaxis for this complication is to avoid large pools of plasma There is a lengthy and valuable discussion of shock and its treatment. All in all, this is a useful book which should find a place in the library of every blood and plasma bank.

A. S WIENER

The Principles and Practice of Modern Cosmetics Vol. II Cosmetic Materials. Their Origin, Characteristics, Uses and Dermatological Action. By Ralph G Harry Octavo of 479 pages, illustrated. London, Leonard Hill, 1948 Cloth, 35/-

This is the companion volume to *Modern Cosmetology* now in print in the United States by the Chemical Publishing Co, Brooklyn. Like its predecessor it is certain to become a necessary manual for dermatologists and cosmeticians who must have at hand the most authoritative work on the origin, characteristics, uses, and dermatologic action of such materials.

NATHAN THOMAS BEERS

Clinical Ophthalmology. For General Practitioners and Students. By H. M. Traquair, M D Octavo of 264 pages, illustrated. St Louis, C V Mosby Co, 1948 Cloth, $9 00

This little compend on ophthalmology is very useful for the purpose for which it was written It is well written and well printed

Doubtless, this small volume will be well received and will justify the inclusion of more illustrations in later printings

JOHN N EVANS

Biochemistry for Medical Students By William Veale Thorpe, Ph.D 4th ed Octavo of 496 pages, illustrated Baltimore, Williams & Wilkins Co, 1947 Cloth, $5 00

The author's concept of what biochemistry encompasses is that it is the study of chemical processes in living tissue and not the chemistry of living tissues. He, therefore, regards it as a dynamic science concerned not only with the organic analysis of tissue structure but with their functions Thus, the author has successfully condensed into this small volume not only a discussion of biochemistry but also of the physiology of these biochemical agents. On frequent occasions he has ventured off into the clinical implications of many altered physiologic processes These discussions are, of necessity, brief and fragmentary but make for stimulating the interest of one starting on a medical career

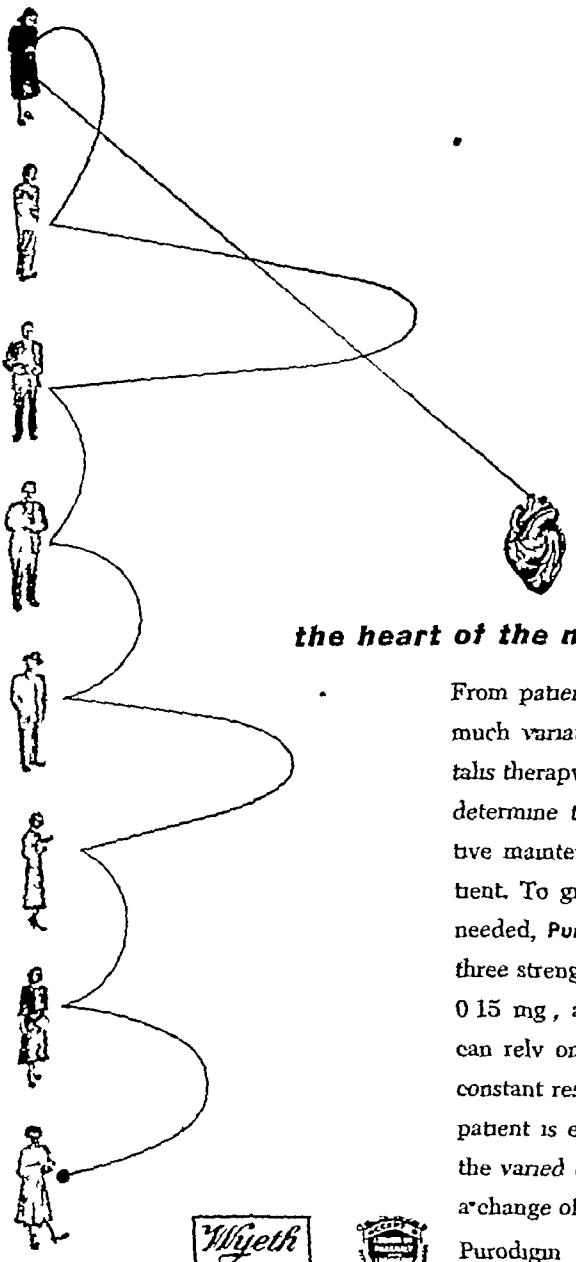
W S COLLENS

Diagnosis in Gynaecology A Classification of Gynaecological Diseases Based on Aetiology and the Clinical Logic for Diagnosis By James V Ricci, M D Octavo of 259 pages Philadelphia, Blakiston Co, 1948 Cloth, $4.50

This well-planned text presentation is decidedly different Chapters are devoted to structures and organs, not topics This works out well, yet inevitably leads to some repetition as in endometriosis, for instance *Few would be willing to simplify our* spelling completely, yet Ricci's valiant effort to resurrect the defunct diphthongs *ae* and *oe* is astonishing Painstakingly written, this is a good book

CHARLES A GORDON

Principles Governing Eye Operating Room Procedures By Emma L Clevenger, R N Octavo of 215 pages, illustrated. St Louis, C V Mosby Co, 1948 Cloth, $5 50



This book fills a long-felt want in the ophthalmologic library of both nurses and surgeons Material is presented in a useful and concise form

The reviewer does not feel that the value of the book has been greatly added to by the inclusion of preferences by the various surgeons and the instruments which they are employing at the present time in various procedures The progressive surgeon is seldom content to adhere year after year to the same instrument setup

Perhaps future editions will contain an appendix which will give a minute description or detailed drawing of each instrument so that its characteristic features and specific name can be learned by the beginner Also, such a detailed description would enable the surgeons and nurses to recognize advantages, disadvantages, and defects

As far as the reviewer knows, there is no source to which one may turn for a description of the peculiarities and the construction and dimensions of the various instruments such as cataract knives, iris forceps, etc

JOHN N EVANS

the heart of the matter . . .

From patient to patient, there is so much variation in response to digitalis therapy that the physician must determine the therapeutically effective maintenance dose for each patient. To give him all the flexibility needed, **Purodigin®** is available in three strengths for oral use 0.1 mg., 0.15 mg., and 0.2 mg. tablets. You can rely on Purodigin to produce a constant response, the comfort of the patient is easily maintained through the varied tablet strengths whenever a change of dosage is indicated.

Purodigin is pure crystalline digitoxin, Wyeth

SULFADIAZINE with SODIUM LACTATE—MRT

Each 5 cc (one teaspoonful) provides:
0.5 Gm. Sulfadiazine
1.5 Gm. Sodium Lactate

in Palatable Liquid Suspension

Therapeutically Active • Minimum Renal Involvement • No "bicarb" Therapy Needed • Self-Alkalizing • Ideal for Infants as well as Adults • Palatable Easily Administered Either Plain or Admixed.

SULFADIAZINE WITH SODIUM LACTATE—**MRT**—available in 16 fluid ounce and gallon containers at all prescription pharmacies

SULFADIAZINE WITH SODIUM LACTATE—**MRT**—another original contribution of Marvin R Thompson—is manufactured under U S Patent No 2,460,437

no coined names *specify* **MRT**

In Hypochromic Anemia

OVOFERRIN possesses these magnificent advantages

1. **Easily and readily assimilated**
2. **Virtually unaffected by gastric juices**
3. **Wholly acceptable to the patient**
4. **Its use entails no gastric upsets**

PROMOTES A BUILD-UP WITHOUT A LET-DOWN

Physicians who encounter the usual difficulties in the administration of ionized iron preparations will find in Ovoferrin a most valuable ally in gaining the objective of increased hemoglobin without distressing side effects

℞ MAINTENANCE DOSAGE

For Adults and Children One teaspoonful 2 or 3 times a day in water or milk.

℞ THERAPEUTIC DOSAGE

ADULTS One tablespoonful 3 or 4 times daily in water or milk *CHILDREN* One to 2 teaspoonfuls 4 times daily in water or milk

Professional sample on request

An Old Pewter Nursing Nipple of Sainted Memory but Not Sanitary

ATTRACTED by a reference to The Mead Johnson Collection of Ancient Nursing Bottles," a medical friend sent in to us as a loan the interesting pewter nipple shown above The nipple had been given to the physician by an elderly patient who had used it as a child in the 1840 s It had also been used by her mother, her grandmother, and other members of her family

In the eighteenth century, feeding bottles too, were made of pewter, which is an alloy of about 80 per cent tin, with copper and lead or antimony In the wealthier homes, feeding bottles and nipples were made of a special kind of pewter called Britannia metal, which contained tin, antimony and copper, and sometimes zinc It was more easily fashioned on the lathe and could be nickel-plated or silver-plated Those were the days before bacteriology, and when one examines the long, narrow, inaccessible channel in this pewter nipple through which the infant sucked his feeding, and sees that the channel could not possibly be kept clean, one wonders that the infant mortality rate of those presanitation days was not even higher

Nowadays, babies bottles and nipples are easily cleansed and sterilized Certified cow s milk contains a permitted maximum of only 10,000 bacteria per cubic centimeter Dextri-Maltose,* the carbohydrate of choice of so many physicians, is practically sterile Rigid control methods at the dairy and in the Mead Johnson Manufacturing Department, and care in the home combine to give modern babies sanitary protection not enjoyed by those babies that were fed through pewter nipples of sainted memory

It is significant to reflect that it was through the efforts of physicians that safe, pure milk and sanitary dairy control came to be standardized and practised, and that Dextri-Maltose* came into existence in response to the widespread demand of physicians for a carbohydrate that would give superior results in infant feeding

* Dextri-Maltose is the registered trademark of Mead Johnson & Company for its refined carbohydrates produced by enzymic action of barley malt on corn flour

Findings from the Saratoga Spa records*

INHALATIONS

The results obtained in the treatment of 738 patients with inhalation at the New York State-owned Saratoga Spa show interesting tendencies

Marked relief of the condition treated was noted in 38 patients (5.2%), moderate relief in 468 patients (63.4%), temporary relief in 46 (6.4%), and no change in 185 (25%)

Conditions for which the treatments were given included sinusitis, coryza, bronchitis, chronic rhinitis, bronchial asthma, laryngitis, allergic rhinitis, hay fever, and pharyngitis The treatments consisted of the inhalation of finely nebulized saline-alkaline, naturally carbonated mineral waters, and medicated oils

The relief obtained bore a definite relation to the number of treatments taken In acute conditions, from four to six treatments were necessary to obtain consistent improvement while in chronic conditions, twelve to fifteen treatments were usually required.

Inhalations are taken without discomfort, which is an important factor in therapy

The safety of the therapy can be stressed Reactions of significance occurred in only three patients One patient may possibly have had a sensitivity to chlorenan, one developed an acute asthmatic paroxysm and the third noted a general reaction to epinephrine

Attention to the general condition of the patients suffering from respiratory disorders is an important factor Inhalations have a definite place in the general "cure" regimen of a spa.

* *As printed in the New York State Journal of Medicine 44 1214 (June 1) 1944.*

The SARATOGA SPA

"Physician, Give Heed to Thine Own Health"

Many physicians have come to the Spa for the same kind of treatments that have helped their patients here After a restorative "cure" at the Spa, you, too, will return to your practice refreshed—revitalized—ready for the busy days that lie ahead.

For professional publications of the Spa, and physician's sample carton of bottled waters with their analyses write W S McClellan M D., Medical Director Saratoga Spa, 155 Saratoga Springs, New York.

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

a happier, more normal life for the hypertensive

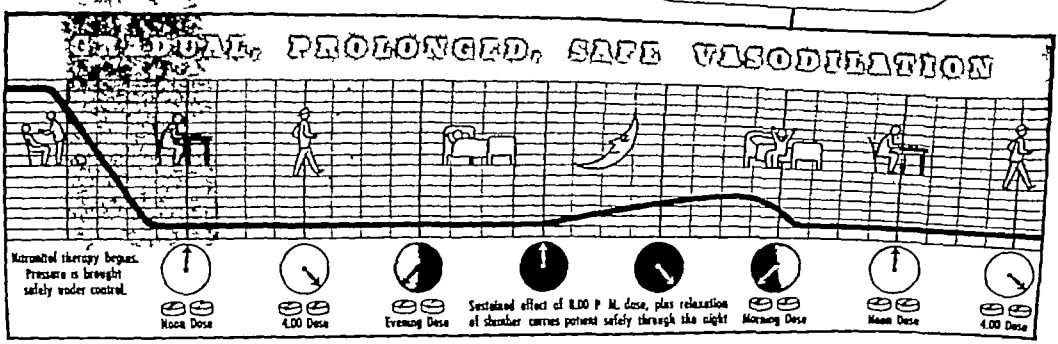
NITRANITOL

Trademark Reg. U S Pat Off.

The psychogenic factors which so often contribute to hypertension are usually aggravated by the restrictions which the disease itself places on the patients activities The result is a *vicious circle* that forces pressures to higher levels and renders management increasingly difficult

Nitranitol *reverses* the vicious circle because its prolonged action permits maintenance of blood pressure at levels where a reasonable degree of useful and pleasant activity is possible With an improved psychic attitude the patients physiologic response to the medication is correspondingly better The negligible clinical toxicity of Nitranitol permits continued use of the drug for an indefinite period

Nitranitol contains ½ gr mannitol hexanitrate in each scored tablet. Average dosage 1 to 2 tablets every 4 hours. At hospital and prescription pharmacies in 100 s and 1000 s



When sedation is desired in addition to vasodilation—

NITRANITOL
WITH PHENOBARBITAL

—combines ¼ gr phenobarbital with ½ gr mannitol hexanitrate Scored tablets in 100 s and 1000 s

THROAT SPECIALISTS PROVE CAMEL MILDNESS IN

30-DAY SMOKING TEST

● In a recent coast-to-coast test, hundreds of men and women smoked Camels—and only Camels —for thirty consecutive days They smoked on the average of one to two packages of Camels a day Each week during the entire test period, the throats of these Camel smokers were examined by throat specialists A total of 2,470 careful examinations were made And after correlating these case histories, the throat specialists reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION due to smoking CAMELS."

MONEY BACK GUARANTEE!

Try Camels and test them as you smoke them If at any time you are not convinced that Camels are the best cigarette you've ever smoked return the package with the unused Camels and you will receive its full purchase price plus postage (Signed) R J Reynolds Tobacco Co Winston Salem N C.

According to a Nationwide survey

MORE DOCTORS SMOKE CAMELS

than any other cigarette

When three leading independent research organizations asked 113,597 doctors what cigarette they smoked, the brand named most was Camel

biliary "thaw"

In noncalculous cholangitis, stasis within the common duct often underlies ascending infection Inflammation and narrowing of the lumen fosters partial obstruction and accumulation of purulent matter The dynamic action of *Decholin Sodium* and *Decholin*—hydrocholeresis—overcomes this biliary stasis Under hepatic pressure copious, watery bile sluices down the biliary ducts like a spring thaw, carrying off pus debris mucus and stagnant bile With drainage thus re-established the systemic response is improved

Therapy should be initiated with small progressively increasing doses of *Decholin Sodium* given intravenously, followed by a course with *Decholin* tablets

HIGH POTENCY CHORIONIC GONADOTROPIN

"A.P.L."®

Brand of Chorionic Gonadotropin

There is reason to believe that, in certain cases, more favorable results may be obtained with doses of "A P L" larger than those heretofore recommended [1]

"A P L" No 972, in dried form, is designed to facilitate the administration of massive dosages Each package provides

*1 One Secule * containing 20 000 I U*
2 One 10 cc vial sterile diluent containing 0 5% phenol A P L (Dried) may be reconstituted to a volume of 5 or 10 cc thus providing concentrations of 4 000 or 2,000 I U per cc
A P L is also supplied in sterile solution as follows.
No 500—500 I U per cc —10 cc vials
No 999—1000 I U per cc —10 cc vials

"A P L" has been used successfully in the treatment of chronic cystic mastitis, threatened abortion, functional uterine bleeding, cryptorchidism, hypogenitalism, and Fröhlich's syndrome

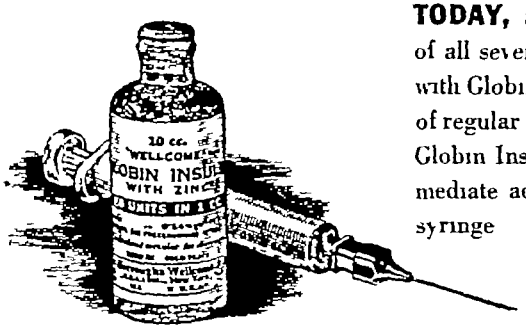
GLOBIN INSULIN

'B.W.& CO.'



was developed to fill the "need for an insulin with activity intermediate between that of regular insulin and that of protamine zinc insulin"[1]

IN 1939, Reiner, Searle and Lang described a new intermediate acting" insulin

IN 1943, after successful clinical testing, the new substance was released to the profession as 'Wellcome' brand Globin Insulin with Zinc 'B W & Co

TODAY, according to Rohr and Colwell, "Fully 80% of all severe diabetics can be balanced satisfactorily"[2] with Globin Insulin 'B W & Co '—or with a 2 1 mixture of regular insulin protamine zinc insulin *Ready to use* Globin Insulin B W & Co ' provides the desired intermediate action without preliminary mixing in vial or syringe

In 10 cc vials U-40 and U-80

B.W & CO '—*a mark to remember*

BURROUGHS WELLCOME & CO (U S A) INC. Tuckahoe 7 New York

Psoriasis and Neurodermatitis

New Concept

Psoriasis and neurodermatitis are treated systemically in a new therapy developed clinically by Perlman[1]

The medication used is a refined grade of undecylenic acid specifically selected for oral administration Preliminary reports on clinical usage show definite response in a majority of the cases treated.

Why and how this new form of undecylenic acid works is not yet known It is an odd numbered carbon atom unsaturated straight chain fatty acid and may play an important role in abnormalities in fatty acid metabolism

Description

The undecylenic acid used by Perlman and others for their cases is now available under the name of Declid Undecylenic Acid Capsules

Declid Undecylenic Acid is supplied in soft gelatin capsules, 0 44 g Uncapsulated the acid is an oily water insoluble liquid with a fatty odor and bitter taste

Tolerability

Declid Undecylenic Acid has been administered in large daily dosages over long periods without severe side reactions or toxic symptoms

After taking Undecylenic Acid, some patients complain of a bitter taste in the mouth mild nausea belching or dyspepsia These are relieved by antacids Increased bowel activity is sometimes noted When justified, reduced dosage or temporary cessation of treatment is advised These side effects in most cases, do not reappear when full dosage is resumed.

CLINICAL RESULTS

Favorable responses in 25 cases of psoriasis and neurodermatitis are reported by Perlman[1]

In the cases reported so far these improvements have been noted in varying degree in the different patients

1 Subsidence of itching

2 Complete or partial disappearance of lesions

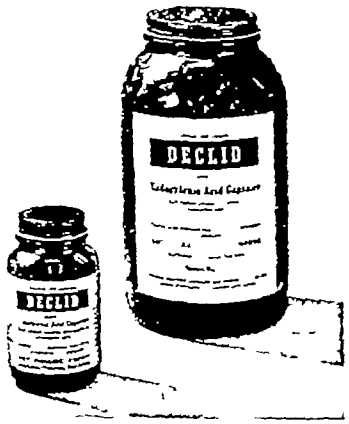
3 The probable prevention of recurrence by maintenance dosage

In cases of psoriasis associated with arthropathies Perlman[2] noted in a preliminary report that arthritic pains diminished or disappeared following oral undecylenic acid treatment He has found relief and improvement from symptoms in 6 cases of arthritis and bursitis not complicated by psoriasis and urges further research by others

Dosage

Declid Undecylenic Acid is not a fast acting drug Quick response should not be expected The optimum dosage has not been determined The physician must evaluate

On Prescription Only at Drug Stores



DECLID UNDECYLENIC

Treated Orally With New Drug

each case and adjust the dosage to the response

The capsules may be taken between meals, after eating or with food as best tolerated by the patient

Suggested dosage schedule *First week* Four Declid Capsules 3 times daily, *Second week* 6 Capsules 3 times daily *After second week* 8 to 10 Capsules 3 times daily if needed and continued for several months or until complete disappearance of lesions Tolerability is enhanced by taking the capsules with a carbon

Declid Undecylenic Acid Capsules, 0 44g each, are supplied in bottles of 100 and 1,000

ated beverage water or ginger ale

If high dosages are taken over long periods frequent urinalyses and blood counts are recommended

Adjunctive Therapy

The response to Declid Undecylenic Acid has been accelerated by external use of a medicated ointment, such as ammoniated mercury 3% and salicylic acid 3% in anhydrous lanolin petrolatum base

Contraindications

Oral therapy with Declid Undecylenic Acid is new, and much is still unknown about its effect on metabolism Therefore *it should be administered with caution,* and not to debilitated, diabetic or hypertensive patients or those with coronary or gall bladder symptoms

Caution

It must be emphasized that all the clinical work reported has exclusively employed only this particular grade of undecylenic acid Ordinary commercially available undecylenic acid supplied for *external uses* is not recommended, since its possible effects when taken internally are unknown

Declid Undecylenic Acid is to be dispensed only by or on the prescription of a physician Literature available on request.

spasmolysis

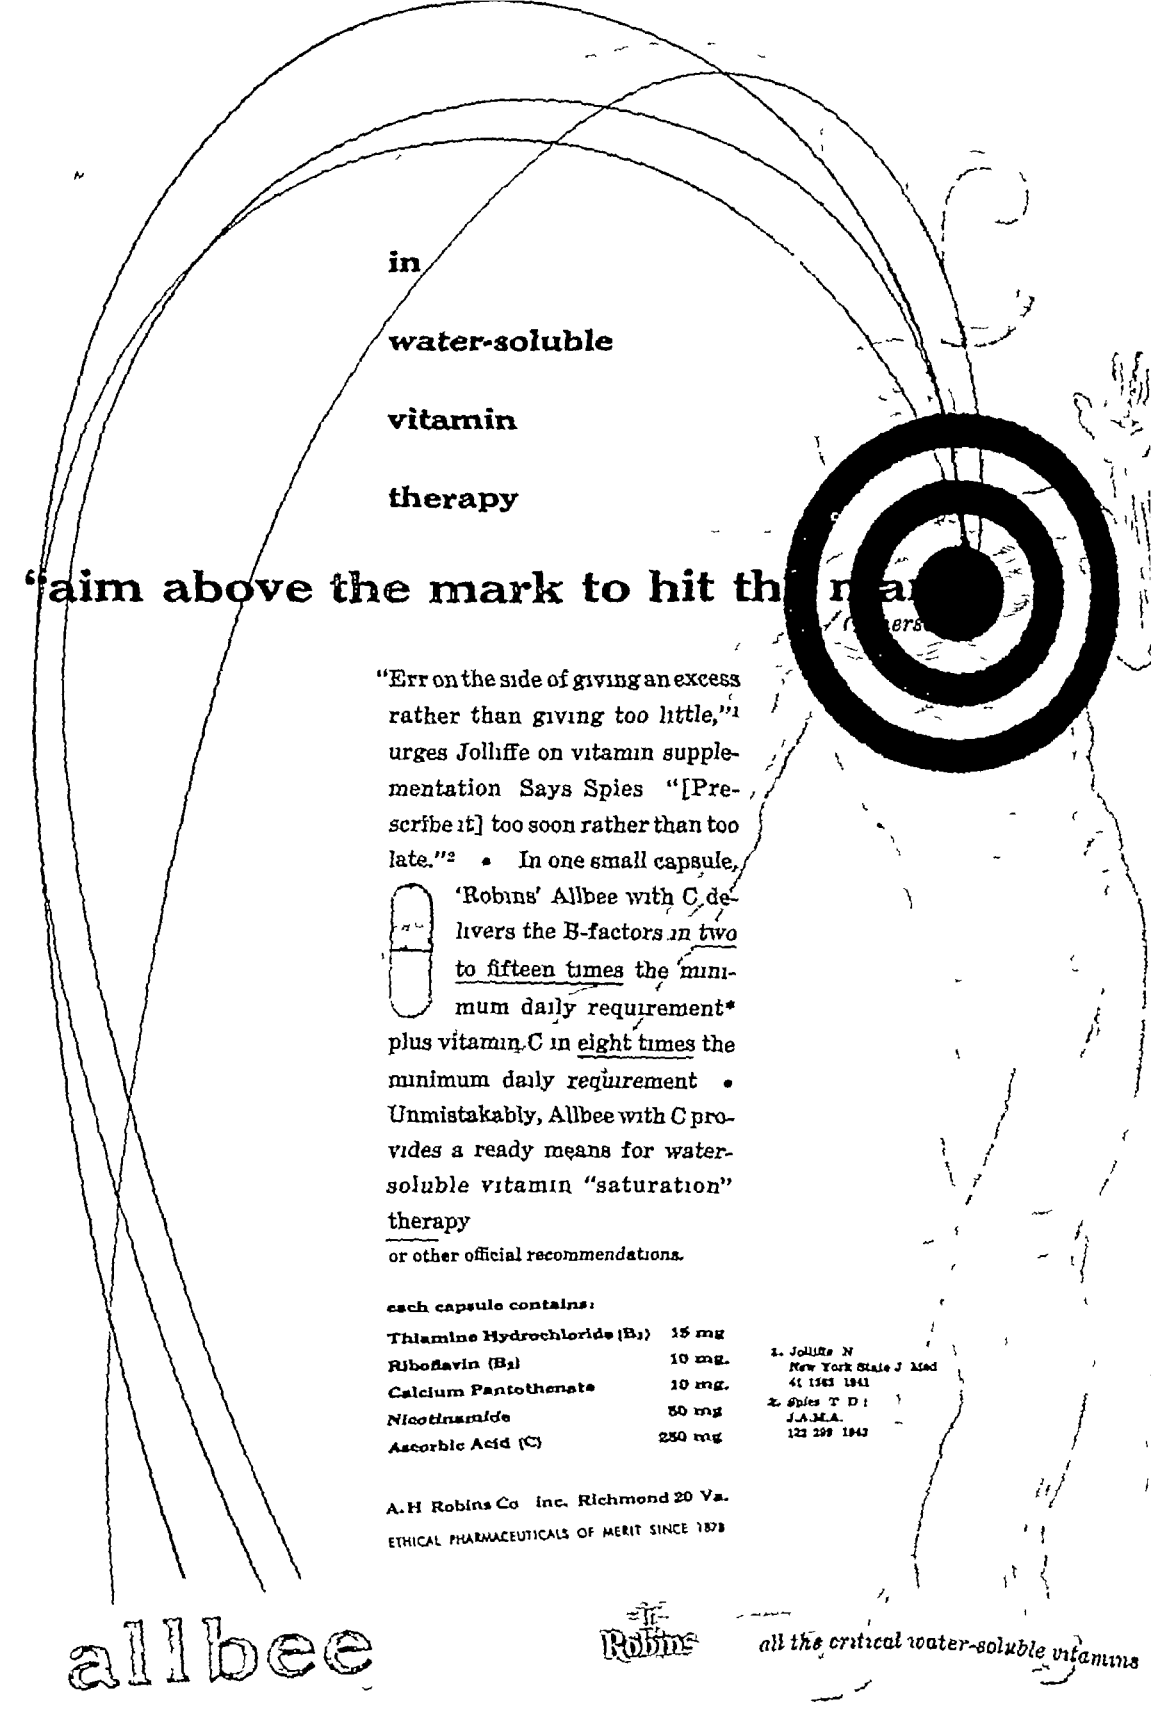
spoonfed

For your discriminating choice
of a spasmolytic agent,
these striking characteristics of
Robins' Donnatal Elixir
are particularly noteworthy

- It's a superior spasmolytic in the most varied manifestations of visceral vagotonia—it suits the youngest oldest or the most finicky "taste"
- It provides the principal *natural* belladonna alkaloids in unvarying optimal ratios—is compatible with many adjuvant medications
- It comprehensively combines peripheral and central sedation—for c either genic r psychogenic etiology

It's potent spasmolysis
spoonfed!

Each 5cc of Donnatal Elixir contains:
Hyoscyamine Sulfate 0.1037 mg
Atropine Sulfate 0.0194 mg
Hyoscine Hydrobromide 0.0065 mg
Phenobarbital (¼ gr.) 16.2 mg



elixir

Also available
as
Donnatal Tablets
and
Donnatal Capsules

Dramamine

Prevents and Relieves "NAUSEA OF MOTION"

Dramamine, brand of dimenhydrinate, was the subject of clinical study in the now historic investigation of Gay and Carliner* aboard the U S Army Transport *General C C Ballou* Under conditions of control in this rough-weather Atlantic crossing, it proved 98 6 per cent effective in prophylaxis and 96 per cent effective in the treatment of seasickness

Later investigations are proving it to be equally efficacious in the prophylaxis and treatment of airsickness, car sickness, train sickness and, in short all forms of nausea caused by motion

A 100 mg dose administered half an hour before the onset of motion and repeated four times a day during the trip is usually adequate

Dramamine is supplied in 100 mg scored tablets in bottles of 100 tablets each

G. D. SEARLE & CO, Chicago 80, Illinois

Urinary pH No Problem *with*

MANDELAMINE

Urinary Antiseptic of Choice

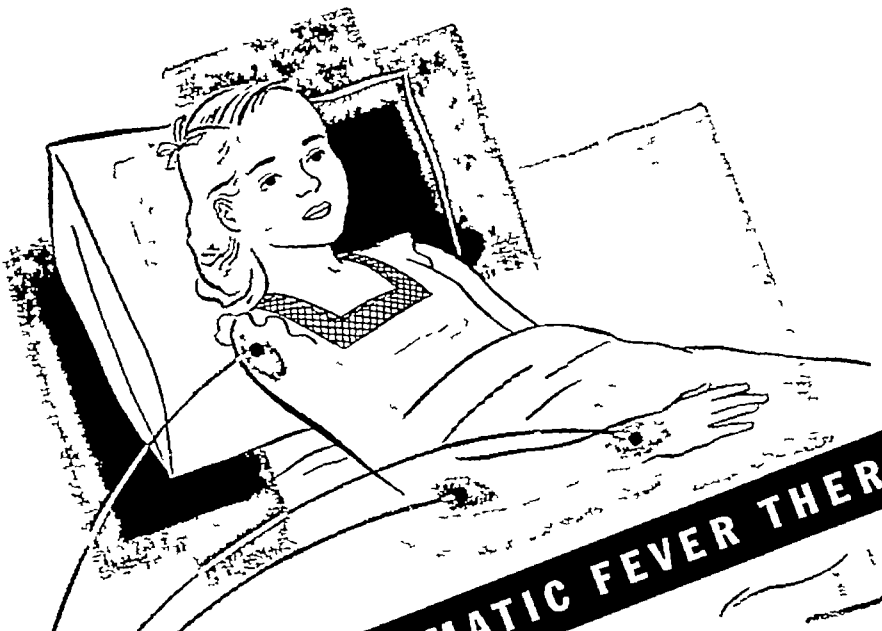
MANDELAMINE* therapy is simple, it requires no complicated regimen involving adjuvant acidifying or alkalinizing agents to enhance efficacy or reduce toxicity

Carroll and Allen,[1] reporting the results of a clinical study comprising 200 cases, write

> "The administration of Mandelamine maintained an acid urine without dietary restriction or other drug therapy, excepting in those cases in which urea-splitting organisms were present."

MANDELAMINE'S effectiveness in both acute and chronic cases of urinary infection and its remarkable freedom from toxic reactions further commend it as the urinary antiseptic of choice

SUPPLIED: Enteric coated tablets of 0 25 Gm (3¾ gr) each, bottles of 120, 500, and 1,000



1 Carroll, G, and Allen, N H J Urol 55 674 (1946)

*MANDELAMINE is the registered trade mark of Nepera Chemical Co, Inc. for its brand of Hexydaline (methenamine mandelate)

6 OUTSTANDING FEATURES

1 No gastric upset
2 No dietary or fluid regulation
3 No supplementary acidification (except when urea splitting organisms occur)
4 Wide antibacterial range
5 No danger of drug fastness
6 Simplicity of regimen—3 or 4 tablets, t.i.d

IN RHEUMATIC FEVER THERAPY

A SIGNAL IMPROVEMENT

Salcedrox permits administration of *adequate* amounts of salicylate without complicating gastric intolerance and with reduced systemic toxicity It also combats and corrects the frequently associated depressed ascorbic acid blood levels Thus it markedly enhances the therapeutic efficacy of salicylate medication in rheumatic fever, allied rheumatic states, and whenever salicylates are indicated

Salcedrox combines in a single tablet

Sodium salicylate	5 gr	Calcium ascorbate (equivalent to 50 mg ascorbic acid)	1 gr
Aluminum hydroxide gel, dried	2 gr	Calcium carbonate	1 gr

STATISTICALLY SIGNIFICANT

Recent important investigations confirm superiority of molybdenized ferrous sulfate in iron-deficiency anemia.

Dieckmann, W. J , and Priddle, H D Anemia of Pregnancy Treated with Molybdenum-Iron Complex, Amer J Obstet. & Gynecol , (March) 1949

Dieckmann and associates recently undertook an evaluation of molybdenized ferrous sulfate (Mol-Iron) in anemia of pregnancy—a relatively resistant type of anemia

A carefully selected group of patients was given Mol-Iron in a dosage of 2 tablets 3 times daily, a comparable group of patients who received no iron medication served as controls

FINDINGS: "The patients who were treated showed a rapid increase in hemoglobin and hematocrit with a mean at term of 11 8 Gm per 100 ml and 36 volumes per cent—high figures for pregnant patients The mean for the present control group is 10 7 Gm of hemoglobin per 100 ml. and a hematocrit of 32 6 volumes per cent (at term) At six weeks post partum, the patients who had been on molybdenum-iron had a mean of 12 2 Gm per 100 ml as compared with 11 2 for the present (control) group "

COMMENT: "We have never had other iron salts so efficacious in pregnant patients Our results with the molybdenum-iron complex have been so striking that, if the patient has taken this medication for three weeks and shown no significant increase in the hemoglobin concentration, the therapy is stopped and a more extensive study (bone marrow biopsy, gastric analysis, reticulocyte count, etc) made to determine the cause of the anemia "

SUMMARY: "We believe that the value of this molybdenum-iron complex has been demonstrated as being very effective in increasing the hemoglobin of pregnant patients who are anemic "

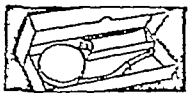
ADVANCE IN ANEMIA THERAPY

Talso, P J Anemia in Pregnancy, J Ins Med, 4 31-34 (Dec -Jan -Feb) 1948-1949

The encouraging results obtained with molybdenumized ferrous sulfate in the microcytic hypochromic group indicate a better prognosis in these conditions in the future with a resultant improvement in maternal health generally '

Chesley, R F, and Annitto, J E Evaluation of Molybdenized Ferrous Sulfate in the Treatment of Hypochromic Anemia of Pregnancy, Bull Margaret Hague Maternity Hospital, 1 68-75 (Sept) 1948

" molybdenized ferrous sulfate produced a substantially more rapid therapeutic response than ferrous sulfate, the difference in response being statistically significant Addition to ferrous sulfate of either liver-stomach extract or folic acid did not potentiate the action of the iron salt



None of the patients treated with molybdenized ferrous sulfate complained of more than mild digestive symptoms related to the medication However, 8 per cent of the patients originally selected for treatment with ferrous sulfate had to be withdrawn from the study because of consequent digestive up-sets

White's **Mol-iron** Tablets, Liquid

MOLYBDENIZED FERROUS SULFATE

a specially processed, co precipitated, stable complex of molybdenum oxide 3 mg (1/20 gr) and ferrous sulfate 195 mg (3 gr) In bottles of 100 and 1000 Tablets Also available in a highly palatable Liquid, in bottles of 12 fluid ounces

at all times

for corrective alkalization

LIQUID CITRALKA®

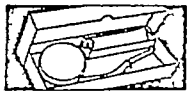
sometimes to counteract the condition:

as in decreased alkali reserve and trend to acidosis

sometimes to assure the therapy:

as in administration of sulfonamides or antibiotics

Increasingly, LIQUID CITRALKA is an accepted routine "therapeutic partner" in antibiotic and sulfonamide therapy, where effective protection against crystalluria is essential And LIQUID CITRALKA is well established as a general systemic alkalizer, valuable for urinary alkalization in pyuria, pyelitis, and urethritis



Since LIQUID CITRALKA has a mildly acid reaction (pH of 4 5 to 5 0) it does not interfere with either gastric acidity or protein digestion, but yields the needed basic ions *in body fluids and tissues*

LIQUID CITRALKA, in appropriate dosage, is readily acceptable to adults, children and infants It is often diluted with water, milk or fruit juices

LIQUID CITRALKA: Bottles of 8 fluidounces and 1 gallon.

sign of pernicious anemia[1]

Achlorhydria is a classical sign of pernicious anemia Once pernicious anemia is diagnosed adequate therapy must be instituted and maintained But, remember, it is not the liver substance itself but rather the hemopoietic principle and secondary factors *stored* in the liver that promote normal blood formation

Liver Preparations Armour

are tested regularly for hemopoietic potency according to approved methods, on actual pernicious anemia patients in relapse And it has been proved that the Armour Laboratories have mastered the art of preserving the active blood regenerating constituents of the fresh liver in an extract for therapeutic use.

Armour Liver Preparations

Liver Injection

2 U.S.P Injectable Units per cc (Crude
4 U.S.P Injectable Units per cc.

Made from the unrefined 70% alcohol soluble fraction of liver extract in the manner described in the U.S.P XIII for the preparation of Liver Injection (Crude)

Liver Injection 2 U.S.P units (Crude) (Armour) is available in 10 and 30 cc. rubber-capped vials

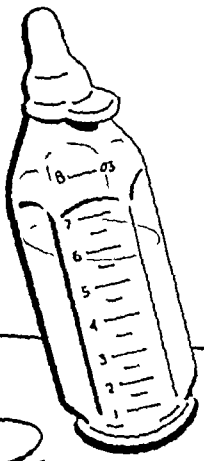
Liver Injection 4 U.S.P units (Armour) is available in 5 and 10 cc. rubber-capped vials.

10 U.S.P Injectable Units per cc. in 1 cc 5 cc. 10 cc. and 30 cc. rubber-capped vials.

15 U S P Injectable Units per cc. in 1 cc., 5 cc. and 10 cc. rubber-capped vials A highly refined and concentrated preparation for massive dosage.

Solution Liver Extract — Oral

45 cc equal 1 U.S.P Oral Unit A readily assimilable and therapeutically effective preparation for use when the oral route is indicated or preferred.



Liver Extract Concentrate — Capsules

9 capsules equal 1 U.S.P Oral Unit. Odorless tasteless Sealed gelatin capsules in boxes of 50 100

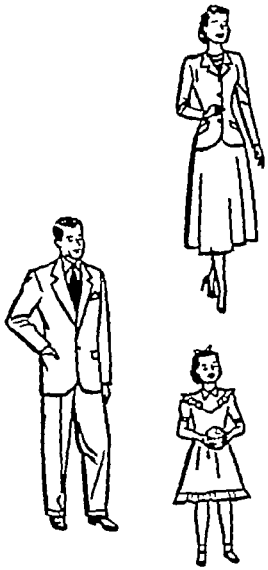
(PATCH)

— Emulsion Mineral Oil and Irish Moss —

is effective in restoring and maintaining regularity The emulsion has a smooth, creamy texture and a pleasant flavor with no oily taste or aftertaste Since it does not upset the stomach, cause griping or gas pains, the youngster is blissfully unaware of its smooth mechanical action while he sleeps Kondremul is prescribed at bedtime in a small amount of water

'Teen-agers who disdain medicine respond favorably to a frank explanation of the wholly *mechanical* action of myriads of microscopically fine particles of mineral oil, each encased in a tough, indigestible film of Irish Moss, which pass unchanged through the gastrointestinal tract without interfering in any way with normal digestion, absorption and assimilation Kondremul mixes intimately and softens the fecal mass into a soft, putty-like stool, easily eliminated

Three Types of KONDREMUL



KONDREMUL Plain (containing 55% mineral oil)—for usual cases

KONDREMUL with non bitter Extract of Cascara (4 42 Gm per 100 cc.)—for mild laxation

KONDREMUL with Phenolphthalein— 13 Gm. (2 2 grs) phenolphthalein per tablespoonful — for resistant cases

The E. L PATCH COMPANY, Boston, Massachusetts

Scabies, until recently regarded as a disease of poverty or uncleanliness today is known to be found in all walks of life This highly contagious parasitic infestation not infrequently escapes detection, hence the possibility of its presence must always be kept foremost in mind when a red, punctate, inflamed pruritic eruption presents itself

In the eradication of scabies Kwell Ointment containing 0 5% gamma benzene hexachloride in a vanishing cream base, represents a significant advance in therapy A single course of treatment consisting of one or two applications effects a cure in more than 90% of patients Its action is prompt, positive and is not burdened by secondary dermatitis or relapse

Kwell Ointment is available on prescription in 2 oz and 1 lb jars at all pharmacies

ANGINA PECTORIS

ARTERIOSCLEROSIS

CARSTAIRS IS BLENDED WITH CARE FOR PATIENTS IN YOUR CARE

FOR a long time, alcohol has been a helpful ally of the medical profession

No doubt you've frequently prescribed it in the form of whiskey for disorders like angina pectoris and arteriosclerosis, among others

When doing that, naturally you want your patients to have an excellent product That's why Carstairs White Seal is so admirably suited to medicinal use This fine neutral spirit blend is light mild and low in congeneric content

It is blended with care by expert distillers long devoted to the highest quality standards Their perfectionism and skill are responsible for the excellence of the "Perfectly Balanced Blend"

When whiskey is indicated, may we suggest that you recommend Carstairs White Seal to *your* patients?

The Annual Meeting—1949

The successful 143rd Annual Meeting of the Medical Society of the State of New York was concluded on May 6 at the City of Buffalo, with an attendance of 2,500 persons, 1,609 of these being physicians, and 538 others, doctors' wives, medical students, and interns, together with 335 exhibitors The Convention Committee deserves great commendation for the arrangements at the Hotel Statler

During the sessions of the House of Delegates the always difficult matter of processing the large volume of resolutions constituting the greater part of the official business of the House was much facilitated by the excellent corps of typists available In addition, facilities were made available by the editorial staff of the JOURNAL whereby all resolutions could be edited. This procedure reduced materially purely clerical errors, overlong preambles, and simplified the onerous work of reference committees

The increasing work of the House necessitated one evening session lasting until 11 30 P M. We submit that such a legislative day commencing at 9 00 A M. is too long a session. Volume of debate on more and more controversial issues increases year by year Thorough discussion of such issues is of course necessary Perhaps it may become essential to prolong the sessions of the House to three full days in view of the increasing load of work being thrown on the reference committees The question deserves some consideration. Yearly the verbatim minutes also increase in volume This poses the serious problem of increased cost in publishing a supplement to the JOURNAL

It seems incontrovertible that the greater ramifications of formal medicine into the fields of insurance, legislation, public relations, publishing, social welfare, mental health, school health, and workmen's compensation, to cite but a few examples, are producing more complex problems as the years pass by With but one meeting a year when all county society delegates assemble to debate issues of prime importance, debate should not be unduly restricted, even if this means a lengthened session of the House With revision of the Constitution and By-laws in contemplation, this subject might well receive close attention.

Too much commendation cannot be given to the hard-working officers and delegates who labored hour after weary hour to get the

business of the House done Especially, the reference committees deserve the unrestricted thanks of all for their conscientious and thorough hearings, their strict attention to their allotted business, and the general excellence of their reports

It was especially heartening to observe the large proportion of younger physicians in the roster of delegates The gallant phalanx of "older young men" who during the war years and after carried the heavy burden of responsibility was no less in evidence, reduced perhaps in numbers but not in keenness of vision and physical vitality But the newer delegates, many of them veterans of the War, gave certain promise of assuming their responsibilities seriously, without whom the affairs of formal medicine could not long endure

Let them be vigilant, having in mind the words of Cecil Rhodes "So little time, so much to do"

The Doctor as Citizen

Is modern training for a medical career destructive of good citizenship? In theory, no, in practice, yes, with certain reservations

The scope of modern medicine has increased with such incredible rapidity that training of candidates for the doctorate has had to be intensified and compressed within the lengthened period, starting with premedical training and ending with the actual entry of the individual into practice Higher standards, more exacting academic requirements, internships, residencies, Boards in the various specialties—while indisputably producing doctors of greater skills—do so at a price

Part, at least, of that price is the loss to the nation, in many cases, of an interested citizen Almost from the time he starts his premedical training, the candidate in medicine becomes isolated from the ordinary affairs of the community When science was rudimentary, there remained time for the humanities, the learned man could still interest himself in the affairs of the community, the laboratory had not yet engulfed him In modern times the forces of his chosen career, however, are largely centripetal, driving him from the outside in, isolating him in the laboratory, insulating him in the college, and segregating him in the postgraduate schools and hospitals in a manner and to a degree that was never contemplated in the past and is only slightly comprehended now

From the beginning of his premedical studies this progressive isolation of the student from the community and its affairs, except in rare instances, places him in an atmosphere of unreality Little conscious of the background, the history, the evolution of the art and science of the profession he is to practice, he is in these times surrounded from the beginning of his medical studies with "faits accomplis," schools, endowments, libraries, hospitals, equipment of all kinds, in the development of which he has had no part

The student then is imbued with the pride and power of the mere tools and technics of his profession, the perfection of which he admires, since such perfection contributes subtly to his sense of satisfaction in having chosen a career in medicine, the sense of power to heal is as real as the sense of power to rule or to destroy, and the pride of instruments and drugs, of hospitals and schools can be as destructive of real humility as a large legacy from a rich uncle

What sense of obligation to the past from which this perfection has flowed is inculcated in the student? Little, nor none at all. What does the modern student-physician have of that real humbleness of spirit which prompted Ambrose Paré to write in his war-time notebooks, "I bound up his wounds and God cured him?" Arrogance, false pride, and professional isolation from the world of well people have put the student-physician in an equivocal position Even before he begins his own practice, the demands and pressures of his professional studies have precluded for the most part his active participation in community affairs, he knows almost everything except his fellow man

Also, he, only with great difficulty, can afford to marry, because of the financial drain of his education He must marry late if at all and must abridge his family life in the interests of the public demand for his services twenty-four hours a day, seven days a week, including holidays

The projected greater centering of medical practice about the hospital, as many advocate, will be an almost ideal means of removing not only the student-physician but the practicing doctor, also, from the last few contacts with the community of well people Are physicians of the future to inhabit a kind of limbo, to become detached from all ties of citizenship, serving neither on juries, nor as firemen, retaining perhaps a brief obligation for military service as a kind of appendix to justify their citizenship together with the payment of their taxes?

Current Editorial Comment

Occupational Cancer. An article has come to our desk under the title "Cancer in the Factory"[1] It is at once interesting and alarming and we doubt that either the medical profession or the general public is aware of the picture that it paints

Every medical student knows that, in 1775, Mr Percival Pott described cancer of the scrotum occurring in chimney sweeps and suggested that it might be due to the action of accumulations of soot During the next 100 years, paraffin and shale oils, pitch and tar were added to the list of chemical causative agents of cancer of the skin

During the present century, miners' deaths in Germany from cancer of the lung have been ascribed to radioactive ore that they were working Most of us remember the "radium disease" that killed so many young women workers on luminous watch dials

The United States Public Health Service has produced a chart of carcinogenic substances which includes among physical agents—alpha, beta, ultraviolet, x- and gamma rays Likewise the following

Chemical (inorganic)—arsenic, chromates, nickel carbonyl, asbestos, and beryllium The evidence as to beryllium is conflicting

Chemical (organic)—benzol, aromatic amines, polycylic hydrocarbons, soot, carbon black, tar and pitch, paraffin oil, shale oil, mineral oils, anthracene oil, creosote Aniline, azo-dyes and estrogens are regarded as debatable

Parasitic—schistosma hematobium, viruses Clonorchis sinensis is debatable

Medical experts agree that cancer should be a reportable disease, and that compensation laws must be amended to allow for occupational cancer

Questions that arise are "How widespread is this affliction?" Eight thousand cases have already been observed in workers in various industries, affecting many different bodily organs How long and how intense an exposure to these agents will produce cancer in humans? What is the latent period before symptoms appear? Just what happens when the agent comes in contact with human tissue? Does it act directly on the tissue? Does it change the tissue so as to endow it with carcinogenic properties? Does it cause functional change in the liver or endocrine organs, which then generate cancer? Briefly, what causes cancer?

The article concludes

> "Man has already paid part of his penalty for what we call progress He must begin now to pay in the coin of responsibility Having exploited the environment for the sake of the good life, he must now come to terms with it for the sake of a better life"

Medical Program of the Atomic Energy Commission Under the above title Dr Shields Warren of Boston outlines what is being done and what is contemplated by the Atomic Energy Commission in the medical sciences, which constitute one half of the total number of individual projects [1] He believes that the development of antibiotics, the impact of social legislation, and the advent of atomic energy have brought more profound changes in scientific medicine during the past six years than any

DEVELOPMENTS IN PUBLIC HEALTH

From the New York State Department of Health
William A Brumfield, Jr, M D, Editor

Admission of Patients to Public Tuberculosis Hospitals

The fundamental purpose of tuberculosis hospitals is, of course, to provide adequate segregation and treatment for tuberculosis patients Such medical care is one of the most important elements of the tuberculosis control program

Under the provisions of the Public Health Law, in New York State tuberculosis hospital care and treatment which is provided by the State or by any county or city is available without charge to any person in need of such care who has acquired State residence (one year of continuous residence in the State preceding the date of application)

In the upstate area, public tuberculosis hospital care is provided by seven State tuberculosis hospitals, 22 county tuberculosis hospitals, and one city tuberculosis hospital Hospital care for New York City residents is provided in 10 public tuberculosis or general hospitals and a number of private tuberculosis or general hospitals

The following is a brief summary of the procedures for the admission of patients to public tuberculosis hospitals

State Tuberculosis Hospitals The State tuberculosis hospitals are primarily for residents of certain specified counties in each of the State hospital districts (see below), but patients from other parts of the State, including New York City, also may be admitted if suitable beds are available

Hermann M Biggs Memorial Hospital, Ithaca, serves Cayuga, Cortland, Schuyler, Seneca, Tioga, Tompkins, Wayne, and Yates Counties
Mount Morris Tuberculosis, Mount Morris, serves Allegany, Genesee, Livingston, Ontario, Orleans, Steuben, and Wyoming Counties
Homer Folks Tuberculosis Hospital, Oneonta, serves Chenango, Delaware, Fulton, Greene, Lewis, Madison, Montgomery, Otsego, Putnam, Schoharie, and Sullivan Counties
Ray Brook State Tuberculosis Hospital, Ray Brook, serves Clinton, Essex, Franklin, Hamilton, and St Lawrence Counties
Onondaga Sanatorium, Syracuse, serves Onondaga County
Broadacres Sanatorium, Utica, serves Oneida County
J N Adam Memorial Hospital, Perrysburg, serves Erie County

Application for admission of patients from the counties in the State hospital districts may be made to the director of the State hospital by (1) a private physician or health officer (2) the patient or a member of his family, or (3) a public welfare official

A patient living in a county which is not included in a State tuberculosis hospital district may be admitted to a State hospital only when suitable facilities are not available locally or when the facilities of the State hospital are particularly suited for the type of care and treatment indicated In such instances, applications for admission may be made to the director of the State hospital by (1) a superintendent of any county or city tuberculosis hospital, (2) the New York City Department of Hospitals for residents of New York City, (3) a hospital admission agency or any other similar agency authorized for the purpose by a county board of supervisors, or (4) the State Commissioner of Health or his designated representative

Other Than State Tuberculosis Hospitals. Applications for the admission of patients to hospitals other than those operated by the State may be made by a private physician, health officer, patient or member of his immediate family, or public welfare official In areas served by county or city tuberculosis hospitals, such applications should be made to the superintendent of the appropriate public tuberculosis hospital For residents of New York City, the application should be made to the Tuberculosis Admission Bureau of the New York City Department of Hospitals

Applications for residents of Erie County should be made to the Erie County Department of Health, for residents of Albany, Washington, and Westchester Counties to the respective county departments of public welfare (Applications for residents of New Rochelle should be made to the City Department of Public Welfare)

When tuberculosis hospital care and treatment through any of the foregoing channels appears to be unobtainable, applications may be made to the State Commissioner of Health

CARLTON E. WERTZ, M.D.

President-Elect

Medical Society of the State of New York

THE new President-Elect of the Medical Society of the State of New York, chosen at the 143rd annual meeting held May 2 to 6, 1949, in Buffalo, is Dr Carlton E Wertz, a native of Rochester, now residing in Buffalo

A graduate of the University of Buffalo School of Medicine in 1915, Dr Wertz interned at the Deaconess Hospital, Buffalo, where he later became

attending surgeon From 1916 to 1917 he served with the National Guard on the Mexican Border Dr Wertz is now, in addition to his post at Deaconess Hospital, consulting surgeon at the Edward J Meyer Memorial Hospital in Buffalo and at the J N Adam Memorial Hospital in Perrysburg

Dr Wertz is a past-president of the Medical Society of the County of Erie and past-president of the Buffalo Academy of Medicine For more than ten years he has been actively interested in the development of voluntary nonprofit medical care insurance and now is president of the Western New York Medical Plan, which covers eight western New York counties

He is a member of the Erie County Medical Society Workman's Compensation Board, a position he has held since 1937 He has been a member of the Council of the Medical Society of the State of New York for the past five years and is chairman of its Committee on Economics In addition, Dr Wertz is a commissioner of the Associated Medical Care Plans

Current Editorial Comment

[Continued from page 1403]

period since the discovery of bacteria or the invention of the microscope What atomic energy may bring in the development of heat and power for the propulsion of ships and aircraft lies in the future The research tools it provides at the present time are overwhelming

Ionizing radiation may affect the body in two ways external radiation as from the conventional x-ray tube, or as internal radiation from the administration of radioactive phosphorus From an examination of a cell or tissue, there is no way to tell the difference between radiation effects produced by neutrons, by 200 kilovolt roentgen rays, or by the gamma rays of radium The chief effect is assumed to be through interference with the nucleic acid metabolism of the cell In radioactive isotope therapy, an attempt is made to take advantage of selective localizations, such as the specific affinity of bone and phosphorus, or thyroids and iodine

In determining the therapeutic value of any radioactive isotope, one must consider the inherent toxicity of the substance, the half-life of the material, the degree of localization, limit of region effectively irradiated and reasonably high specific activity of the element, preferably 1 millicurie per milligram of element Other limitations exclude all but a relatively few substances that fulfill all these desirable criteria Among the most useful are phosphorus 32, iodine 131, and sodium 24 for cancer research and therapy Cobalt 60 is interesting, its gamma radiations being essentially the same as those from radium For its half-life of five and three-tenths years it is nontoxic, it does not emit alpha particles, and it is not stored indefinitely in bone, like radium and radon

To help relieve the dearth of scientific personnel, a medical training program is developed in the medical and allied sciences It provides up to one hundred predoctoral fellowships annually for one year, and they are renewable Postdoctoral fellowships annually will provide for seventy-five, for a period of two years, and are not renewable

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Anorexigenic Drugs

When the appetite mechanism of an individual is perfect, an even balance between caloric intake and energy expenditure occurs, and the weight of that person remains fairly constant Eating habits of people, as a rule, are established by middle age, consequently most persons gain weight slowly during the fourth and fifth decades, as their energy expenditure declines The increase in weight is usually gradual and not excessive Some people have accumulation of excessive weight whether they are of young or middle age It was pointed out in the preceding article that eating as a means of relieving tension frequently is responsible for obesity [1] It is now accepted by most investigators of weight problems that psychogenic factors are more usual in the development of obesity than are physical ones [2] The treatment of obesity, in addition to other measures, must provide patients with ways to relieve tension and to compensate for unhappiness other than by eating The doctor must help his patient make satisfactory adjustments to emotional distress before he prescribes a specific regime Because obesity occurs only from the consumption of more calories than one expends daily for energy, drugs remain adjuncts to other aids designed to lower the number of calories taken

Nathanson in 1937 reported that obese patients with narcolepsy lost weight following administration of amphetamine sulfate [3] Following this report, considerable interest was shown in the anorexigenic effect of this drug Later, other investigators called attention to a similar effect produced by other drugs whose basic structure contains the 2-aminopropane radical [4,5] All of these drugs act as cortical stimulants All of them depress the appetite to some extent, some more than others All of them raise slightly the basal metabolism, but this effect appears not to be their mechanism of action All drugs in this group may give undesirable effects Sufficient literature has accumulated to allow evaluation of these drugs in terms of being efficient adjuvants in weight reduction, also to judge them in terms of their undesirable effects

There is no uniformity of belief regarding how these drugs exert their anorexigenic properties Harris *et al* report experimental evidence in humans and dogs that these drugs exert their effect by action on the sympathetic nervous system [5] Another point of view regarding mechanism of action is expressed by Lesses and Myerson, who believe that they decrease a desire for food by increasing hedonic tone, i e , they stimulate interest in other matters which give satisfaction and a broader interest [6] Such a concept explains the tendency for these drugs to be more effective appetite inhibitors for obese patients than for people of normal weight and supports the generally accepted theory that many unsatisfied people nibble on tidbits much of the time The change in mood brought about by this group of drugs through cerebral stimulation also may contribute relief of excessive appetite in some people Some observers believe that the dextro form has primarily anorexigenic action and that the levorotatory compound is mainly one with excitatory effect [4] Richardson finds little evidence to support this concept [7] He does believe the dextro form has less pressor effect with the same excitatory stimulation as other compounds All these drugs have some pressor effect but in the range of dosage required for appetite inhibition there is little evidence that more than a slight and transient rise in blood pressure occurs in most patients following their use [8]

Williams *et al* have made an interesting comparison of the effects on patients of eight of these compounds * This group of investigators observed the effect of anorexigenic drugs on 132 markedly obese patients who received a total of 307 courses of therapy varying in length of time from two to fifty-two weeks Taking into account the patient's evaluation in addition to the investigators' observation of weight loss and side effects, Williams and his associates placed the following four compounds in the order of their preference (*a*) *d*,1-phenyl-2-aminopropane, (*b*) 1-cyclohexyl-2-aminopropane, (*c*) 1-cyclohexyl-2-methyl-aminopropane, and (*d*) 1-phenyl-2-methyl aminopropane All of these compounds were found to have good or bad effects or both in most individuals The desirable effects were anorexia, increased mental and physical activity, a sense of well being, more ambition and determination, and less fatigue Undesirable reactions observed were nervousness, apprehension, depression, insomnia, exhaustion, headache, light headedness, dryness of the mouth, an unpleasant taste, nausea, vomiting, and increased bowel movements By means of appropriate regulation of dosage most patients lost weight without the ill effects of the drug remaining prominent All of the compounds produced similar manifestations, but the relative intensity of the symptoms varied considerably [8] Richardson warns of the possible consequences from overstimulation of the latent or overt psychotic individual, citing examples of paranoia following treatment [7]

The selection of the most effective anorexigenic compound depends for the most part on the amount of weight loss it produces in each individual with the least number of undesirable effects The effects of each drug varies with individuals and dosage. The appropriate choice and dosage of a drug is one which will bring about a loss of weight of one pound per week and will not produce enough unpleasantness to interfere with prolonged usage The patient's conclusion is important, but the doctor must view objectively each drug's effect

Tolerance occurs with all these compounds. The desired effects become less marked as the length of time they are taken increases The tolerance effect can be abruptly terminated for a period of time by changing to another compound Time again will result in refractoriness to the second drug, but, fortunately, the first compound can again be used effectively

It appears that the 2-aminopropane group of drugs exerts an inhibitory effect on appetite, and that, by using them as adjuncts to other therapy, these drugs can be useful in the treatment of overweight patients However, they are powerful drugs with complex actions, and therefore must be used cautiously on selected patients The physician who prescribes them has not only a responsibility to his patient, who without supervision may do injury to himself from overactivity, but to society as well for early termination of the drug in an individual who shows abnormal behavior

* *d* 1-phenyl 2-aminopropane 1-cyclohexyl 2-aminopropane 1-cyclohexyl 2-methyl aminopropane, 1-phenyl 2-methyl aminopropane 2-amino-6-methylheptane *d,l*-1-phenyl 2-aminopropane 1(p-hydroxyphenyl) 2-aminopropane 1 1 phenyl 2 aminopropane

Prices Reduced on Perandren

as much as 35% effective June 1st

THE STORY BEHIND PERANDREN PRICE REDUCTIONS

CIBA, a pioneer in steroid hormones, introduced Perandren—testosterone propionate—in 1936 This development was the result of a successful synthesis, accomplished only after years of exhaustive research

Perandren has been subjected throughout the succeeding years to our consistent policy of thorough and painstaking investigation of all phases of its clinical application as well as the efficiency of its manufacture This policy has been supported by large investments of money and research effort

One result of this broad program has been the data and conservative advice which Ciba has been able to place at the disposal of the medical profession Another result has been a gradual increase in manufacturing efficiency with its concomitant savings in cost These savings, together with those which have come from the steadily increasing demand for Perandren, have been passed on in large part to the user, in conformity with what Ciba conceives to be its responsibility to the medical profession and the public

Ciba was the first to bring about drastic reductions in the price of testosterone propionate Now Perandren is benefiting many times the original number of patients, and, with the announcement of another price reduction, Perandren is less than 20% of its original price It is interesting to review the history of Ciba price reductions

January, 1939	Reduced 10%	August, 1947	Reduced 35%
June, 1943	Reduced 10%	February, 1949	Reduced up to 30%
January, 1947	Reduced 20%	June, 1949	Reduced up to 35%

This is concrete evidence of our adherence to the Ciba policy of sharing economies from technological advances with those who enjoy the therapeutic benefits of Perandren, the Ciba brand of testosterone propionate

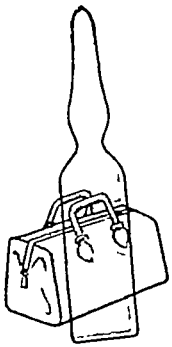
PERANDREN—T M Reg U S Pat Off 2/1502M

a diuretic of choice



"The mercurials are so often effective that other diuretics are being used less and less This is especially true of the formerly popular xanthin derivatives [which] often fail" [1]

"During the past decade or so mercury diuretics have come into use and to a large extent are superseding those just mentioned [theophylline, theobromine sodium salicylate, aminophyllin]" [2]

"In recent years the xanthine derivatives have been used but seldom as diuretics as a result of the introduction of the more effective mercurial diuretics" [3]

MERCUHYDRIN®

well tolerated locally, a diuretic of choice

embodies the merits which have led to the concurrence of authoritative opinion on mercurials in modern diuretic therapy Mobilization of water binding sodium withdrawal of edema fluid and increase of urine volume check tissue inundation as shown in a recent study with radioactive sodium and MERCUHYDRIN [4]

Clinical efficacy is augmented by suitability for intramuscular injection The convenience and safety[6] [7] of this mode of administration facilitates recommended frequent-dosage schedules[8] of modern diuretic therapy

MERCUHYDRIN (meralluride sodium solution) is available in 1 cc. and 2 cc. am

HYPERTENSIVE ENCEPHALOPATHY AND CEREBRAL ARTERIOSCLEROSIS

HENRY I RUSSEK, M D , F A C P and BURTON L ZOHMAN, M.D , F A C P Staten Island, New York

(From the Cardiovascular Research Division, U.S Marine Hospital, Staten Island)

HYPERTENSIVE encephalopathy has been ascribed to an unequal participation of the cerebral vessels in generalized arteriolar constriction According to this view, the cerebral arterioles in systemic hypertension may react less forcefully than those elsewhere in the body and thus give rise to edema of the brain, or individual cerebral arterioles may respond to the rise in arterial pressure by intense spasm, thereby precipitating focal cerebral symptoms [1]

While this concept may be true,the thesis is no longer tenable that vascular encephalopathy is always correlated with arterial hypertension The characteristic clinical picture has been observed in acute glomerulonephritis and lead poisoning in the absence of elevated blood pressure [1,2] Transient aphasia, parasthesia, monoplegia, hemiplegia, and convulsions have also been found to occur in patients with cerebral arteriosclerosis without associated hypertension [3] That diseased arteries are prone to spasm is suggested by observations in peripheral arteriosclerosis in which appreciable constriction of collateral channels has also been noted [1 4 5] Since cerebral arteriosclerosis is frequently found in hypertensive disease, locally diseased vessels rather than arterial hypertension may be primarily responsible for encephalopathic episodes in some cases If this is confirmed, the desirability of therapeutic reduction in blood pressure in such patients should be reconsidered.

The observations of Kety and associates have corroborated the clinical impression that reduction of the hypertensive patient's blood pressure by nonspecific measures is accompanied by persistence of a high degree of vascular tone in the brain and a significant decrease in cerebral blood flow [6] Consequently, utilization of sympathectomy, rice diet, phlebotomy, or other procedures may be contraindicated in the hypertensive patient with advanced cerebral arteriosclerosis since these may engender significant impairment or actual failure of established anastomotic circulation in the brain. Indeed, the possibility even exists that elevated blood pressure in these cases may represent a compensatory mechanism through which normal cerebral blood flow is maintained

On the other hand, in the experience of leading authorities, hypertensive encephalopathy was generally improved or abolished by sympathectomy when the latter was followed by a favorable fall in the blood pressure [7] While this may be true, it must be remembered that operation is infrequently performed on patients over the age of fifty, so that marked compromise of the cerebral circulation may have been uncommonly encountered Furthermore, most surgeons have learned to avoid sympathectomy in patients with arteriosclerotic complications

These considerations led us to employ continuous caudal anesthesia (high caudal block) for the purpose of studying the immediate effects of blood pressure reduction upon hypertensive encephalopathy associated with cerebral arteriosclerosis Four hypertensive patients who suffered from this cerebral syndrome and in whom there was suggestive evidence of extensive cerebral vascular disease, as indicated by such findings as generalized arteriosclerosis, arteriosclerotic retinopathy, previous cerebral thrombosis, or advanced age, were tested in this manner The ages were fifty-six, fifty-eight, sixty-two, and sixty-seven, respectively The response to lowering of the blood pressure by sympathetic block (through the medium of caudal anesthesia) was similar in all four patients One case which was followed to necropsy is described in detail as follows

Case Report

R L , a fifty-six-year-old, white merchant seaman, was admitted to the U S Marine Hospital with a history of high blood pressure of many years duration Ten months prior to entry he suffered a

Published with the permission of the Surgeon General, U.S. Public Health Service, Washington, D C.

"stroke" which left him paralyzed on his left side. There was gradual return of motor power, however, with partial recovery of function permitting resumption of light duty. One month before admission, he suffered a sudden attack of dizziness, impairment of vision, and inability to speak, which persisted for approximately one hour. Similar attacks recurred intermittently until the day of admission when paralysis of the right side of the body was noted. Family history indicated that both parents and four siblings had died of either "stroke," hypertension, or kidney disease.

Physical examination revealed a well-developed well-nourished, white man with florid facies, who was able to understand simple commands but who lacked the ability to speak. There was paralysis of the right side of the face. Slight cyanosis of the lips was present. Pupils were equal and reacted to light and accommodation. Fundi showed hypertensive retinopathy, grade III. The heart was moderately enlarged in its transverse diameter. There was a normal sinus rhythm. A blowing systolic murmur of grade III intensity was heard at the mitral area. The second aortic sound was markedly accentuated. Blood pressure was 224/120. There was no evidence of decompensation. The lungs were clear. There was moderate pain on flexion of the left thigh. The extremities on the left side were moderately spastic, on the right flaccidity was present. Reflexes were hyperactive on the left and hypoactive on the right. X-ray of the chest revealed clear lung fields with moderate enlargement of the heart to the left. Electrocardiogram showed a pattern suggestive of old posterior myocardial infarction. Urinalysis revealed a specific gravity of 1.032 with slight albuminuria. Nonprotein nitrogen of the blood was 40 mg. per cent.

During the ensuing forty-eight hours motor aphasia gradually disappeared, and strength began to return to both right extremities. Weakness on the left side remained unaltered. In subsequent weeks there were recurrent attacks of mental confusion, aphasia, right hemiplegia, generalized convulsions, and coma. Blood pressure during attacks was in the range of 260/140. Between episodes it fell to 180/110. Because of the rapid recurrence of seizures which numbered 10 to 20 per day and the elevation in blood pressure which accompanied the episodes, an attempt was made to abolish the hypertension temporarily by means of continuous caudal anesthesia (Fig. 1). It was found that even when the blood pressure was maintained in the normotensive range for a period of three hours, generalized convulsive seizures recurred with equal or greater severity. Collapse and coma with complete flaccidity developed when the blood pressure dropped to 80/60. These were quickly overcome, however, by discontinuance of the anesthetic and supportive therapy. The blood pressure soon rose to 195/115. Spinal fluid pressure was measured at this time and found to be 120 mm. of water. The course was progressively downgrade during the ensuing days, and the patient finally expired. An autopsy was performed.

Postmortem examination revealed a brain of normal size weighing 1,360 Gm. The convolutions appeared normal. On section an area of subcortical softening was found in the left hemisphere near the midline, involving an area of 5 by 2 cm. This zone was brown and semifluid in consistence. The basal ganglia appeared normal on both sides. The cerebral arteries showed an extremely severe atheromatous degeneration with thickening of the vertebral and basilar arteries and of the two internal carotids. The process was not calcific, and most of the thickening of the wall appeared to be due to yellow fatty material. Even the smaller arterial branches were involved. The heart weighed 440 Gm. The coronary arteries showed considerable arteriosclerosis and tortuosity. The main branches were patent. On section of the myocardium, the left ventricle showed numerous foci of pale gray color, ranging in size up to 5 mm. in diameter. There were narrow streaks of fibrosis throughout. Findings in other organs were not remarkable.

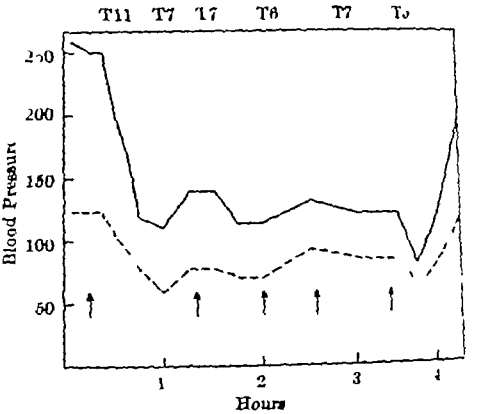

FIG. 1. Response of blood pressure to continuous caudal anesthesia (Metycaine). Solid line, systolic; broken line, diastolic; T, thoracic level of anesthesia. Arrows indicate generalized convulsive seizures.

Discussion

Temporary spinal sympathetic block with reduction of blood pressure in the hypertensive patient has been found to be associated with persistence of vasoconstriction in the brain and significant decrease in cerebral blood flow.[1] That similar response follows surgical sympathectomy is suggested by the observation that constriction of the retinal arterioles continues even after normotensive levels have been restored for long periods.[2] The question arises, therefore, as to the advisability of "correcting" hypertension when there is impending failure of the cerebral circulation as a result of extensive arteriolar sclerosis. Our studies in which high caudal block restored normal blood pressure levels for several hours in four hypertensive patients with recurrent encephalopathic episodes indicate that no improvement or an actual aggravation of symptoms accompanies this procedure when there is underlying cerebral vascular disease.

These findings are in direct contrast with those of Jost who reported that he was able to prevent eclamptic seizures in each of nine patients with toxemia of pregnancy, merely by restoring normotensive levels through the use of caudal anesthesia [9] Obviously, the cerebral episodes in both conditions do not have the same pathogenesis Eclampsia is commonly associated with elevation of blood pressure, angiospastic cerebral phenomena, and edema of the brain Reduction in blood pressure with concomitant decrease in cerebral blood flow might, therefore, be expected to reverse cerebral changes in this condition. Similarly, hypertensive encephalopathy associated with cerebral edema and/or angiospasm (without extensive arteriosclerosis) has apparently been benefited by surgical sympathectomy [7] In these conditions, reduction in blood flow to the brain, resulting from fall in blood pressure, would appear to be more than counterbalanced by the improvement in circulation arising from subsidence of cerebral edema and cessation of angiospasm

In our cases, however, the same factors do not seem to have been operative No edema of the brain was found, as shown by the appearance of the eyegrounds, cerebrospinal fluid pressure, and autopsy studies Extensive cerebral arteriosclerosis with impaired cerebral circulation aggravated by angiospasm appeared responsible for the symptomatology Since the same clinical picture may occur with cerebral arteriosclerosis alone in the absence of arterial hypertension, the role played by the latter is not clearly defined [3] It is likely that elevation of blood pressure augments the tendency of diseased vessels and their collaterals to undergo spasm Consequently, although reduction in blood pressure may have lessened the degree of angiospasm in our cases, the concomitant decrease in cerebral blood flow in the presence of advanced arteriolar sclerosis apparently did not permit a favorable change in the impaired circulation of the brain Indeed, it is theoretically possible, although not proved, that hypertension itself is occasionally initiated by cerebral vascular disease and when so evoked serves to maintain an adequate supply of blood to the brain That interference with such elevation of the blood pressure may actually precipitate clinical symptoms is shown by the observation of Fishberg, i e, that marked mental depression may follow surgical sympathectomy for hypertension in some cases [8] The writers, moreover, have witnessed the development of recurrent encephalopathic episodes in two hypertensive patients in whom elevated blood pressure was restored to normal levels as a result of acute coronary occlusion [10] It is significant that in neither of these patients was congestive failure or shock a part of the clinical picture Similarly, sudden fall in the blood pressure as a result of profound mercurial diuresis was found to have precipitated cerebral thrombosis in three elderly hypertensive patients with congestive heart failure [11] The possibility also exists that some of the cases, commonly regarded as cerebral embolism following myocardial infarction, may, in reality, be instances of cerebral thrombosis precipitated by fall in the blood pressure and decrease in cerebral blood flow The autopsy studies of Dozzi lend support to this view [12] If confirmed, another indication for the use of dicumarol in myocardial infarction should be recognized

These considerations suggest that, in the presence of extensive cerebral arteriosclerosis, therapeutic reduction of elevated blood pressure may not only fail to control but may actually initiate or aggravate cerebral symptoms Furthermore, since cerebral vascular disease with or without associated hypertension may produce most of the features of the syndrome generally referred to as hypertensive encephalopathy, the criteria for diagnosis of this condition should be reconsidered Hypertensive encephalopathy is generally recognized without difficulty in cases of hypertensive disease in which transient focal cerebral symptoms and other manifestations are dependent upon cerebral edema Its diagnosis then rests upon the demonstration of increased intracranial pressure as evidenced by papilledema, increased cerebrospinal fluid pressure, headache, vomiting, convulsions, and coma In many instances, however, the diagnosis must depend on the associated clinical picture Thus, transient focal symptoms occurring in a patient with previous cerebral vascular complications or in an elderly subject with evidence of generalized arteriosclerosis are probably due to cerebral arteriosclerosis, irrespective of the associated level of blood pressure On the other hand, focal cerebral symptoms in the patient with acute glomerulonephritis, eclampsia gravidarum, or hypertensive disease (associated with papilledema) are, in all probability, manifestations of hypertensive encephalopathy It is apparent that many of the cases which were in the past classified as hypertensive encephalopathy actually were instances of cerebral arteriosclerosis in which hypertension played only a secondary role There are undoubtedly instances in which both cerebral edema and cerebral arteriolar sclerosis contribute to the clinical picture In some cases, moreover, only necropsy study can clearly indicate which of these factors was responsible for the clinical symptom-complex Fishberg concurs in this altered concept which is at variance with his original contention that the syndrome is invariably correlated with arterial
